*Printed in Great Britain by
The Amalgamated Press, Ltd., London*

Its Editor presents—

The New Universal Encyclopedia

NOTHING is more obvious than the need for change which must overtake any encyclopedic work from the moment the world's affairs are thrown into disorder by such enormous dislocation as a world war involves. It was this that led our publishers during the War of 1914-18 to embark upon the large and costly enterprise of preparing, under the present editorship, an encyclopedia on entirely new lines, of which the first serial number appeared on February 10, 1920, after some six years of intensive preparation. And it was the hope of its editor that he had provided a work of universal reference, covering the entire field of knowledge and information in such a way that, for some generations at least, it would remain a standard work of ready reference requiring only periodical revision to keep it abreast of the latest developments in the sciences, in contemporary history, in the respective realms of thought and fact.

AS such the Universal maintained its pre-dominance through all "the years between." Its sales were quite without precedent for any such large work of universal knowledge, not only throughout the British Empire, but in foreign lands where the intelligentsia were readers of English. In the United States, under another publisher's name, it attained great popular success after a process of Americanising, which affected only a small percentage of its contents. But a further revised edition of the original Universal, in contemplation for some time before Hitler spoke the word whereby chaos came again, was abandoned when it was clear that no revision or augmentation

appreciably short of a *new* encyclopedia, so far as the main body of text was concerned, would meet the needs of the post-war world, while the same applied, though in lesser measure, to the illustrations.

Thus, for a second time, while a second world war was still raging, the formidable task of compilation had to begin all over again. With the exception of the Editor-in-Chief no member of the original editorial staff remained in service, an entirely new staff having to be recruited under conditions of extreme difficulty.

BUT after a continuous period of nearly five laborious years, with the exceptions only of certain basic and permanent contributions, such as classical history and pre-war biography, all else has been contributed afresh by a staff of eminent experts. Save for a very few pages where there was no need for change, and where change could not have improved them, the whole work has been re-set in conformity with its original style, which had won the approval of a whole generation of readers by reason of its unusual clarity.

Photo by Howard Coster

IN a work where the picture element is so important (our total of illustrations now approximates to 25,000) a large proportion of the original illustrations had to be retained simply because they could not be improved upon, but even so the present edition contains between 4,000 and 5,000 new illustrations, either replacing such as had become out of date, or expressly prepared to accompany some of the thousands of new articles which have been written to cover the progress of knowledge in every branch

of science during the last twenty years, and especially every aspect of the changing world since 1939. Moreover, our illustrations really *illustrate*. With but rare exceptions the maps, which form so notable a feature of the work, have been drawn afresh, and all those reproduced in colours contain the latest frontier and boundary lines as far as these had been internationally agreed up to the hour of going to press. Any further modifications that may be the outcome of UNO decisions will be duly recorded at the end of our final volume, the whole work being planned for completion in a total of ten volumes.

BUT in this matter of newness the most important change concerns the general text. The amount of the original letterpress retained is less than twenty per cent of the new aggregate, which exceeds eight million words, and is limited to those subjects that, in the strictest use of the word, were finalised from their first writing. Thus incomparably the greater part of the *NEW UNIVERSAL* has been written by a galaxy of new contributors from the mid-war period onward, so that the sum total represents the latest information about every subject in which the general reader is likely to be interested.

THE reader who fully appreciates the significance of all this is not likely to question our editorial claim that the *NEW UNIVERSAL ENCYCLOPEDIA* lives up to its title in being both universal and new. Indeed, it is confidently offered to the reading public as the first post-war work of its kind completely "up to date" in all its contents, literary and pictorial. And here it is important to explain, since some lapse of time must take place between publication of the successive volumes, that as each new volume goes to press every single item that might be subject to the slightest change is closely scrutinised for further notification under *Novissima Verba* (or Latest Information), a supplementary feature which was originated in our first serial issue and

proved so useful towards attaining absolute completeness in each edition.

WHILE new knowledge is the important feature of the *Universal*, ancient lore must always be part of that reading which, as Bacon says, "maketh a full man." Hence the *NEW UNIVERSAL* in recognizing that need offers a comprehensive survey of learning.

But, with our eyes intent upon modern things, we have sought to reduce greatly the more antiquated matter which still bulks largely in many encyclopedias, rescuing from it, however, every fact or thought that might be of value to the post-war reader in the enrichment of his mind.

BUT merely to set down as briefly as may be the main established facts concerning every subject deemed worthy of inclusion was not enough for the purpose of the *NEW UNIVERSAL*. It aims at being of real assistance to its readers: suggestive, helpful, *practical*. Thus it is an encyclopedia with a point of view. Its technical information is accompanied by comment or advice—the advice of those best qualified to give it—its biographical facts are seasoned with some words of appreciation, its historical articles enlivened by reflection.

An encyclopedia should be its own index, and should be so compiled that anyone in search of a particular reference may find it forthwith. Hence, long and exhaustive treatises are eschewed, and every one of our more than 400 contributors has sought to convey in the fewest words the maximum of information.

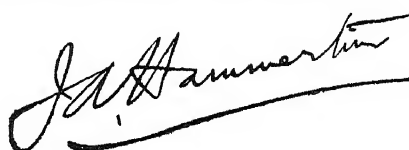

OUR list of contributors contains scores of names that stand for the highest level of contemporary knowledge in the sciences, the arts, and letters. But all scientific contributors have been discouraged from expressing themselves in the professional terms of their science: clearness of statement is everywhere evident in their contributions.

Editor-in-Chief

AIDAN PHILLIPS DAVID LE ROI

SOME OF OUR CHIEF CONTRIBUTORS

In this list an obelisk sign (†) after a contributor's name indicates that he has died since writing the article, in some cases while the work was passing through the press. An italic *C.* indicates one or more of the subjects contributed.

Throughout the Encyclopedia, where an asterisk (*) is prefixed to the name of a contributor it indicates that he is not responsible for writing the entire contents of the article, but accepts responsibility for its emendation or amplification.

- V. E. YARSLEY, D.Sc.
Consulting chemist; member of Council, Inst. of Plastic Industry. C. Plastics, etc.

THE ENCYCLOPEDIA HABIT

Every generation enjoys the use of a vast hoard bequeathed to it by antiquity, and transmits that hoard, augmented by fresh acquisitions, to future ages.—MACAULAY

THE NEW UNIVERSAL is designed to be the companion and helper of everyone who is seeking information on subjects that either interest or perplex him. To those whose general education may not be so good as they could wish, it will open new doors of knowledge; but even to those whose education ranks them among the most intelligent and cultured of the community it will, by virtue of its wide scope and scholarly compression of scientific and general lore, prove invaluable as a constant source of ready reference.

A POPULAR phrase used to be "Get the Encyclopedia habit," and the advice is no less sound in these days, when it is obvious on every hand that the general thirst for knowledge, especially for those "fresh acquisitions" of which Macaulay speaks in the passage quoted above, has by no means abated.

THE popularity of the so-called "quiz" as a feature of radio programmes as well as of many newspapers and magazines is evidence of a wide contemporary interest in facts of every kind. But such information as is derived from listening to or reading a "quiz," being purely fortuitous and unrelated to the immediate personal needs of the listener or reader, is unlikely to find a permanent place in his memory.

ON the other hand, he who cultivates the "Encyclopedia habit" becomes in effect his own "quiz-master," choosing his own questions and finding for himself all

he needs, and more, in the way of answers. He is systematically enlarging his store of knowledge, thereby increasing both his mental efficiency and his enjoyment of life. It is indeed astonishing how greatly one's fund of knowledge may be enlarged, and at how little trouble, thanks to this "Encyclopedia habit."

FOR example, nothing is more certain than that in reading your newspaper today or tomorrow you will encounter a reference to something that is not clear to you, or that you will find a writer touching very lightly upon a subject of which you know little or nothing and on which you would have welcomed further information. In all such cases the simple act of turning to a good work of reference and looking up the subject in its pages will result in the immediate acquirement of new and perhaps valuable information.

THUS, regarded solely as a companion to the daily paper, an Encyclopedia is an indispensable item of equipment in every well-stocked home, where it may be said to serve as a resident "Brains Trust." But its use is, of course, much wider and greater than that. There is no subject of conversation or thought on which a good Encyclopedia has nothing to offer by way of comment or suggestion to the man, woman or child who has acquired the "Encyclopedia habit." And the knowledge that is self-sought is the more likely to endure.

ACROPOLIS: THE CITADEL OF ANCIENT ATHENS AND CENTRE OF HER RELIGIOUS AND CULTURAL LIFE AS IT APPEARS TODAY (See page 74)

FOR thousands of years A has been the first letter of the alphabets of the civilized peoples. It is found in primitive form in various Semitic alphabets, including the Phœnician, probably earlier than 1000 B.C. Before that date, writing was pictographic, as seen in the cuneiform inscriptions of Babylonia and Egyptian hieroglyphics dating from roughly 5000 B.C. Most nearly corresponding with A in the Egyptian characters was  (âhom, the eagle), chosen, doubtless, because  the eagle, as the king of birds, was associated with the supreme god. For speed in writing, the scribes evolved a simpler form, . But these symbols represented a restricted range of ideas; they were not letters which could be freely employed.

The early Semitic  and its variants, though pictographic in origin, were used as we use the letters of our alphabet, to indicate the sounds from which words are formed. The first of the Semitic letters originally represented an ox's head; in Hebrew, it was named âleph, the word for ox, and cognate names were given in Arabic and Syrian. To agricultural communities the ox was

of primary importance—often an object of worship; the Assyrians, the Egyptians, and the Cretans all had bull-gods and cow-goddesses. The classic Greek alphabet formed about 600 B.C. was based largely on the Semitic scripts. The Semitic aleph in its various forms became the classic Greek (alpha) . At first there was only one form for each letter. But later, for more rapid writing, dual forms were evolved, the original forms being used as capitals, or majuscules, and the new forms as small letters, or minuscules. For A, the minuscule was *α*. About A.D. 400 another series of capital letters, the Greek "uncials" was used largely for inscriptions; in this, A became *Α*.

A Latin alphabet, derived from the early Greek, existed in 800 B.C., and had assumed its classic Roman shape by 500 B.C. It is this Roman alphabet that we now use for our English alphabet; indeed, the alphabets of all important modern languages, except the Arabic and the Russian, are based on the Roman. The Russian alphabet is a form of the Greek alphabet devised in the 9th century A.D. by Cyril, the apostle of the Slavs.

A First letter and vowel of the English and many other alphabets. Its commonest sounds in English are those heard in *bar, map, bald, name*. Under the influence of certain consonants and in certain positions it has the value of short *e*, *i*, *o*, *u*, as in *many, village, was, about*. It may be doubled, but this is rare, occurring only in names and words of foreign origin, e.g. *Aaron, Baal, Ealaam, aard-vark*. Combined with other vowels, as in *ae, ai, ao, au, aw, ay*, it has in each instance except *aw*, more than one phonetic value. The diphthong *ae*, corresponding to the Greek *ai*, as in *Caesar, aegis*, is frequently pronounced as two syllables, as in *aerated*. *Ao*, pronounced as a diphthong in *aorist, aorta*, also occurs in the word *gaol*, pronounced and commonly spelt *jail*. *Ai* and *ay* usually have the sound of a *n* in *name*, but sometimes they have that of short *a*, *e*, and long *i*, as in *plaid, says, aisle*, and *quay* is pronounced *kee*. *Au* generally (*aw* always) has the sound of *a* in *call*, but in *aunt, gauge, laurel, laudanum* that of a *n* in *father and name*, and of *o* in *not*. See Alphabet.

A. In music this is (1) the sixth note of the natural scale of C. In the Middle Ages musical modes were started from most of the notes of the scale represented by the level—now white—keys of the organ, which are whole tones apart, except E—F and B—C, which are semitones. The order of the tones and semitones in the mode which started on C is now the normal or major scale, hence

the subordinate position of A in the modern scheme of musical notation. (2) A. being the pitch of one of the strings of each of the bowed instruments of the modern orchestra, has been chosen for the tuning note. The Philharmonic pitch of 1896 standardizes A as 439 double vibrations per second at 68° F, except for all-wind bands.

A1. Symbol for first class. Used originally in Lloyd's Register of Shipping to denote the best type of wooden vessels, the only ones then in existence.

Aa (Lat. *aqua*, water). Name of numerous small European rivers. The Swiss Aa, in the cantons of Lucerne and Aargau, drains lakes Baldegg and Hallwyl into the Aar. Two rivers Aa fall into the Gulf of Riga. In Germany the Westphalian Aa is a tributary of the Werre, and the Munster Aa a tributary of the Ems. The French Aa, between the departments of Nord and Pas-de-Calais, is navigable from Gravelines to St. Omer.

Aachen. City of Germany, also known by its French name, Aix-la-Chapelle (*q.v.*).

Aahhotep. Name of two Egyptian queens. The coffin of Aahhotep I, mother of Aahmes I (c. 1580 B.C.), found by A. Mariette at Thebes in Egypt, 1859, and now at Cairo, contained her mummy, with a collection of fine jewelry. This included gold and silver boats with crews, a ceremonial bronze axe, diadem, mirror, gold chain and scarab, and hinged bracelets.

Aahmes. Name of two Egyptian kings, called by the Greeks Amasis. Aahmes I (c. 1580 B.C.)

expelled the Hyksos from Memphis, and founded the XVIIIth dynasty. Aahmes II (d. 526 B.C.) revolted against Apries the Pharaoh-hophra of Jer. 44, and seized the throne. His land being invaded by Nebuchadrezzar (or Nebuchadnezzar) II, he contracted alliances with Croesus, king of Lydia, and Polycrates, tyrant of Samos. He opened Naucratis to Greek traders.

Aal or **ACH.** Indian dye-stuff. Prepared from the wood or roots of various species of *Morinda*, chiefly *Morinda cūrifolia*, Indian mulberry or togari wood, it is used to dye cloth a dull red colour, the fabric being boiled together with powdered aal, castor-oil seeds, and alkaline earth. The dyed cloth, called *kharua*, is said to be immune from the attacks of white ants, and is used by native shopkeepers to wrap up account books.

Aaland or **ALAND ISLANDS.** Group of some 300 isles and rocks at the entrance to the Gulf of Bothnia, forming the Finnish department of Ahvenanmaa. Only about 80 are inhabited; the largest, Aaland, is 18 m. long, and the area of the group is 565 sq. m. Mariehamn is the chief town. The people, mainly of Swedish origin, are skilful sailors and fishermen. Hardy cereals and cattle are raised, and meat, fish, hides, cheese, and butter are exported.

In 1809 Sweden, to whom the islands had long belonged, ceded them to Russia, and since then the question of fortifying them, their position being of great strategic importance, has been the subject of frequent dispute. In 1854,

Abai OR **ABAY**. Abyssinian name of upper Blue Nile, in Egypt, called Bahr-el-Azrek (*q.v.*).

Abana. With Pharpar, one of the rivers of Damascus mentioned in 2 Kings 5. It is the modern Barada (*q.v.*).

Abancay. Town of Peru, cap. of Apurimac dept., in the centre of one of the most fertile basins of the Eastern Andes, where sugar-cane, alfalfa, coffee, and semi-tropical fruits are extensively grown. Labour is cheaply obtained from the indigenous Indians. The town has become increasingly important as a centre of trade in sugar, tobacco, quinine, coffee, and cacao. The basin is drained by the river Apurimac, thence by the Ucayali into the Amazon. Pop. 5,000.

Abandonment (Fr. *à bandon*, at liberty). In law, the surrender of one's rights or privileges. The surrender must be voluntary and with full knowledge of all the circumstances. Coercion or fraud vitiates the abandonment. In legal actions the plaintiff may, at any time before the receipt of the defence, or after such receipt but before taking any other proceedings in the action, wholly discontinue or withdraw, by notice in writing, any part of his action, subject to the payment of costs occasioned by such withdrawal. If further proceedings have been taken, the leave of the court must be obtained, and the court may at any time order such discontinuance, subject to such order as to costs as may be just. A defendant cannot abandon his defence without leave.

There can be no abandonment in proceedings of a criminal nature. A crime is a public wrong which affects the whole community and the prosecution is in the name of the King as representing the community. The person against whom the wrong has been committed cannot elect to abandon the prosecution of the offender. To settle the matter with the wrongdoer is itself a criminal offence—compounding a felony. Where, however, the evidence is clearly insufficient to prove the commission of the offence by the prisoner, the prosecutor may, subject to approval of the judge, offer no evidence. The judge then directs the jury to find a formal verdict of Not Guilty, and the prisoner is discharged. The prisoner cannot be indicted and tried again for the offence. A prosecution may be determined by issuing a *nolle prosequi* by leave of the attorney-general. This usually occurs in cases where a civil

action is pending arising out of the same circumstances as gave rise to the criminal proceedings, or where the defendant is being harassed by the prosecutor presenting defective indictments. A *nolle prosequi* puts an end to the prosecution, but the defendant may be re-indicted and tried for the offence alleged against him.

Things over which a person has ceased to exercise rights of ownership with the intention of abandoning his rights are *res nullius*, nobody's goods, and they become the property of the first person who takes them with the intention of owning them. Goods are not abandoned merely because there is no apparent owner, and when things are lost they do not cease to belong to the owner. The owner has lost possession, but the property of the goods still resides in him. Hence the person who finds a thing has only a right in it until the true owner is found. If the finder keeps it with the intention of owning it, he commits an offence.

It is a criminal offence to abandon any child or young person in such manner as to cause suffering or injury, the seriousness of the crime depending on the circumstances in each case. It may be misdemeanour, punishable on summary conviction, or murder. See Children, Law concerning.

Abano Bagni (anc. *Aponi Fons*). Summer resort of Italy, in the prov. of Padua. It is 6 m. S.W. of the city of Padua, and has hot sulphur springs and mud baths which were famous in Roman times.

Abarim. Mts. of Moab. They are in Transjordan, E. of the Jordan (Num. 27). The word means "of the other side."

Abased (Lat. *ad*, to; late Lat. *bassus*, low). In heraldry, a charge or device placed lower than its customary position on a shield. It is also applied to wings when open but depressed.

Abatement (late Lat. *abattere*, to beat down). Term used in English law in three senses. (a) *Of legacies*, where, if the legacies bequeathed by a will would not leave enough money to pay the testator's debts, the legatees are required to give up part or, if necessary, all their legacies to make up the amount. If a testator dies and leaves £5,000; bequeaths £1,000 to X, and £500 to Y, and the residue to Z, and his debts are £4,000, Z gets nothing; X's legacy is abated by £333 6s. 8d., and Y's by £166 13s. 4d., being the proportion of their legacies to the £500 required. (b) *Of purchase-money*,

where the vendor of land overrepresents the quantity he has to sell. The purchaser can hold him to his bargain with an abatement of the purchase-money. (c) *Of legal proceedings* brought to an end without any decision being arrived at, in which case they are said to be abated.

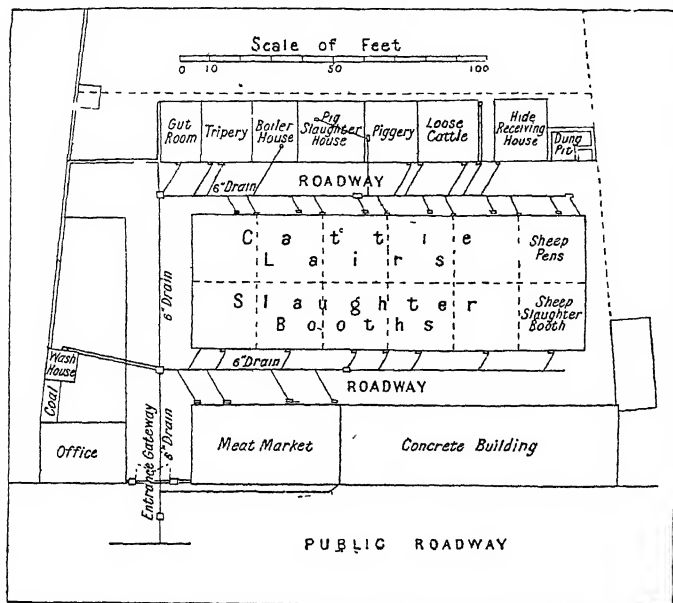

Abatement OR **REBATEMENT**.

In heraldry, a mark rebating or withdrawing the honour of the arms. It is thus applied to symbols of illegitimacy, but more often to imaginary marks invented by the 16th-century heralds—e.g. in an escutcheon reversed sanguine, a blood-red shield placed upside down, assigned to a woman for dishonourable conduct, or to a man for fleeing from the banner of his prince; and the whole shield borne reversed, applied in the case of treason. The last-named is the only abatement, apart from marks of illegitimacy, for which there is any authority. It was applied in courts of chivalry and in tournaments.

Abattis (Fr. *abattre*, to beat down). Military obstacle formed by cutting down trunks of trees, lopping off the small branches, and sharpening the stout ends. These are then placed across a path or approach likely to be taken by the enemy, the butts being anchored to the ground with the spear-like tips facing him. Fixed in a shallow excavation, the obstacle cannot be seen at a distance, and can only by chance be destroyed by artillery, so that the assaulting infantry come unexpectedly upon it. Before wire came into use an abattis was common in field fortifications whenever timber was procurable. At the edges of woods a special form of abattis, called a tree entanglement, is often constructed. Trunks of trees are cut half through, so that the upper portion falls towards the attackers and creates a thick hedge.

Abattoir (Fr.). Public building in which cattle are slaughtered. Various methods of the slaughter of animals for human food have existed from the beginnings of civilization, but there is no reliable evidence of any public abattoirs until the 14th century, when laws governing their use were introduced in England and Germany. Progress in this direction, however, was slow, and the number of public abattoirs in England and Wales was, for a period, not adequate to public requirements.

The private slaughter-house is usually attached to the premises of

Abattoir. Plan of a British provincial abattoir or public slaughter-house built on the booth system usually adopted in the United Kingdom

the meat purveyor. It is frequently nothing more than a shed, with no special design or arrangement. The chief objections to a private slaughter-house are that it is frequently in a crowded thoroughfare, therefore a nuisance from the continual driving of animals to it, and a cause of depreciation in the value of adjacent property. More serious is the impracticability of efficient control and inspection. As a rule, a private slaughter-house consists of only one compartment. It is usually impossible for one butcher to provide a slaughter-house for himself with separate compartments for slaughtering, cleaning the offal, etc.

During the last 40 years many fine public abattoirs have been erected in the United Kingdom by local authorities, and a new department of the engineering profession has been formed in order to provide up-to-date equipment for them. Public abattoirs should be situated conveniently near the cattle market, and, if possible, away from the centre of the town and the principal traffic. The market for dead meat should also be close at hand; in fact, the whole business of the meat industry of the city should be centralized as far as possible. The flooring should be impervious, a complete system of drainage instituted, and an abundant water supply laid on. Within the abattoir two systems of construction are adopted, the

open-hall system and the booth system. In the former the open hall is a large building without any subdivisions, there being nothing inside except the mechanical equipment for slaughtering. In the booth system the hall is divided into separate compartments. This permits privacy in the operations, and the letting of separate booths to individual butchers. In Great Britain the booth system is usually adopted.

During the Second Great War the Ministry of Food concentrated slaughtering in a few abattoirs to economize labour and transport and to control distribution.

A large public abattoir suitable for the needs of a great city will usually consist of the following departments: (1) lairage; (2) slaughtering rooms or halls, subdivided into a hall for cattle, a portion of the same hall for sheep and calves, a hall for pigs, and a hanging-house or cooling-chamber; (3) cold chambers for maturing and storing meat; (4) offal-room and tripe-house; (5) meat inspector's room; (6) room for condemned meat; (7) destructor-room for disposing of condemned meat; (8) engine and boiler house, with steam-boiler, steam-engine, and refrigerating machine; (9) manure depot. See Food, Inspection of. Consult also Public Abattoirs and Cattle Markets, Schwarz.

Abba. Aramaic word meaning father, used three times in the N.T.

(Mark 14; Rom. 8; Gal. 4) in reference to God. As far as is known, the word was restricted to the Deity. It lingers as a title for bishops in the Coptic Church.

Abbadie, ANTOINE THOMSON D' (1810-97). French explorer and scientist. Born in Dublin, of Franco-Irish parentage, he was educated in France and became a naturalized Frenchman. In 1835 he was sent to Brazil by the Académie des Sciences, and travelled in Abyssinia (1838-48). His works include a Geodesy of Ethiopia, a Dictionary of the Amarinna (Amharic) Language, and a Geography of Ethiopia. He left his estate to the Académie des Sciences on condition that it issued a catalogue of 500,000 stars. His younger brother, Armand Michel d'Abbadie (1815-93), published in 1868 an account of their travels called *Twelve Years in Upper Ethiopia*.

Abbas I (c. 1557-c. 1628). Shah of Persia, known as the Great. The son of Shah Mahomed, he succeeded his father in 1586. In 1597, near Herat, he defeated and drove out the Uzbeks. In 1622, aided by an English fleet, he captured the island of Ormuz, diverting its trade to Gomburn, named after him Bender Abbasi, and in 1623 took Bagdad from the Turks. He was an enlightened administrator, though cruel and capricious.

Abbas I, the Great, Shah of Persia

Abbas I (1813-54). Viceroy of Egypt. A son of Tusun Pasha and grandson of Mehmet Ali, he fought under his uncle Ibrahim Pasha in Syria. In 1848 he succeeded Ibrahim as regent, and in 1849, after the death of Mehmet Ali, became Viceroy of Egypt. Cruel and reactionary, he was murdered by two slaves July, 1854.

Abbas II OR ABBAS HILMI (1874-1944). Last Khedive of Egypt. The eldest son of Tewfik Pasha, whom he succeeded in 1892,

Abbas II, Khedive of Egypt, 1892-1914

he received a western education. Becoming reconciled to foreign control, he took a considerable interest in the social and economic improvement of

Abbey Plan of the Benedictine monastery of St Gall, built about 820 The church, which has an apse at each end, is surrounded by the buildings of a self-contained community

1 Glastonbury Abbey Somersetshire, Benedictine house once covering 60 acres 2 Tintern Abbey, Cistercian foundation near Chepstow, Monmouthshire 3 Melrose Abbey, Roxburghshire another Cistercian building

famous for carvings and traceries 4 Bolton Abbey, near Skipton, Yorkshire founded by Augustinians 5 Jedburgh Abbey Roxburghshire Augustinian 6 Fountains Abbey Cistercian edifice near Ripon Yorkshire

ABBEY: RUINS OF GREAT MONASTIC BUILDINGS IN ENGLAND AND SCOTLAND

date from S. Benedict (6th century), under whose rule they are generally formed, though in the East they are found far earlier. Of no particular style in architecture in the beginning, a common form came later into use—a quadrangle, with open cloisters on each side, various buildings adjoining the cloisters, and a big church, either on the N. side to afford shelter from cold winds, or, in milder climates, on the S. side to give shade from the sun. Adjoining the cloisters of the larger abbeys were the oratory, the dormitory containing the cubicles of the monks, the refectory or dining-hall, the kitchen, workshops, infirmary, novice-house, chapter-house, and cellars for stores. A school for boys was held in the cloisters or, as at Durham, in a separate building.

As hospitality was an essential feature of the rule of S. Benedict, every abbey had at least one guest-house, situated within the enclosed grounds, though generally apart from the monastery proper. While the abbot was the absolute authority, in a large community of 100 or more monks his authority had to be delegated in many matters of daily routine, and the following were the chief officials at the important abbeys: the precentor, responsible for the singing in the church services, who was also choirmaster, librarian, and in some cases master of the boys' school; the sacrist, to whom was committed the care of the church fabric, with the sacred plate and vestments, and whose duty it was to see to the lighting throughout the entire abbey; the cellarer, who was responsible for the supply of food, drink, and fuel for the community; the kitchener, upon whom it fell to see to the serving of meals and an adequate distribution of the food; the infirmarian, who tended the sick; the almoner, who distributed alms and food to the poor; the chamberlain, whose duty it was to see to the clothing of the brethren; the novice-master, responsible for the training of all who sought admission to the order; and the guest-master, upon whom devolved the care of the guest-house and the due maintenance of hospitality.

The abbey was a centre of in-

Abbey Theatre, Dublin. This unpretentious building became in 1904 the home of modern Irish drama

dustrial, a place of learning and a self-supporting, self-contained community; and the abbots of all the larger abbeys were landlords on an extensive scale, with seats in Parliament. The cathedrals of Durham, Gloucester, Norwich, Chester, Worcester, and Canterbury, Westminster Abbey, the abbey churches of Bath and Tewkesbury, and the ruins of Kirkstall, Melrose, and Tintern reveal the architectural beauty of the British abbey of the Middle Ages. Of the modern English abbeys, Downside in Somerset, Ampleforth near York, and the Cistercian abbey of Buckfastleigh in Devon are among the more important. *See Monasticism. Consult English Monastic Life, F. A. Gasquet, 1904; English Monks and the Suppression of the Monasteries, G. Baskerville, 1937.*

Abbey, EDWIN AUSTIN (1852-1911). American painter. Born in Philadelphia, April 8, 1852, he first attracted notice by his black-and-white drawings in Harper's Magazine and other periodicals. Settling in London in 1881, he was elected A.R.A. in 1896 and R.A. in 1898. His chief oil paintings are Richard Duke of Gloucester and the

Lady Anne, 1896, and the official picture of the Coronation of Edward VII, 1904. He died at Chelsea, Aug. 1, 1911. The exquisite technique of his work as an illustrator in black and white will probably longest preserve his memory.

Abbey Theatre. Dublin playhouse built by Miss A. E. F. Horniman (*q.v.*) for the Irish National Theatre Society. The Irish Literary Theatre was founded in 1898 with the object of producing plays of Irish life of a kind not commonly seen on the commercial stage. In 1903 it developed into the Irish National Theatre, producing at St. George's Hall, London, plays by W. B. Yeats and Lady Gregory. In 1904 Miss Horniman opened the Abbey Theatre in Dublin for the free use of the I.N.T.S. Here the plays of Yeats, Edward Martyn, "A. E." (George Russell),

George Moore, Padraic Colum, Lady Gregory, Douglas Hyde, and Norreys Connell attracted an interested public. The fame of the Abbey Theatre spread with the production of J. M. Synge's plays of Irish peasant life, *e.g.* *The Shadow of the Glen*, *Riders to the Sea*, *The Well of the Saints*, and *The Playboy of the Western World*. Sean O'Casey contributed to some of the theatre's greatest successes with his *Juno and the Paycock* (1924) and *The Plough and the Stars* (1926). Other dramatists represented in the theatre included Lennox Robinson, St. John Ervine, Bernard Shaw, Denis Johnston, and Paul Vincent Carroll.

Abbot (Aramaic *abba*, father). Title given in the West, not earlier than the 6th century, to the superior of a monastery of twelve or more monks. Within his own jurisdiction he had the authority and insignia of a bishop. Before the dissolution of the

Abbot. Brass of Thomas de la Mare, abbot of St. Albans (1349-1398). From the 12th century abbots adopted the episcopal insignia of mitre, ring, gloves, and crozier

Edwin A. Abbey, American painter. Elliott & Fry

monasteries mitred abbots formed the majority of the lords spiritual in the English Parliament. An abbot is elected, by the votes of the professed members of the community, for life. An abbot president is elected by the abbots of the federated houses of the particular order in each land. The election must be confirmed by the bishop of the diocese, or, if the house be exempt, as Westminster Abbey was, by the Pope. When the greater monasteries possessed large estates the abbot had all the authority of a lord of the manor. In Germany certain abbots—e.g. the abbot of Fulda—had sovereign powers.

Abbot, GEORGE (1562-1633). Archbishop of Canterbury. Born at Guildford in Oct., 1562, the son of a cloth-worker, he was educated at Guildford Grammar School and at Oxford, where he was thrice vice-chancellor. In 1609 he was appointed bishop of Coventry and Lichfield, in 1610 bishop of London, and in 1611 archbishop of Canterbury.

George Abbot,
English Primate

In 1621, while hunting, he accidentally killed a keeper, and an inquiry was instituted into the conduct of a prelate who had committed involuntary homicide while

engaged in so unclerical a pursuit. The inquiry fell to the ground, but left Abbot under a cloud. He died at Croydon in Aug., 1633. Abbot was a pronounced puritan, and as such the prosecutor of both Roman Catholics and Nonconformist Protestants.

Abbot, ROBERT (1560-1617). English divine. Elder brother of George Abbot, archbishop of Canterbury, he was educated at Guildford Grammar School and at Balliol College, Oxford, of which he became master. A famous preacher, he was successively chaplain

Robert Abbot,
English bishop

to James I, regius professor of Divinity at Oxford, and bishop of Salisbury. He wrote against Roman Catholic teaching and in defence of the Reformation, also a reply to Bellarmine on the royal supremacy, and a Latin treatise on the Gunpowder Plot.

Abbot, THE Twelfth of Sir Walter Scott's Waverley Novels. A sequel to *The Monastery*, with which the author connected it by making Edward Glendinning the last abbot of Melrose. Its chronology is at variance with history, but its intensely sympathetic study of Mary Queen of Scots ensures it a permanent place in historical fiction. The novel was first published in Sept., 1820.

Abbot of Unreason OR LORD OF MISRULE. Name given to the master of the revels in medieval times. He was chosen by election at times of festivity, particularly Christmas. At Oxford, Cambridge, the Inner Temple, and Gray's Inn he had charge of the Christmas revels, arranged the Latin plays, and acted as master of the ceremonies. His counterpart in certain French towns was called the Abbé de Liesse. Other names for an official with like authority were Abbas Stultorum, or Abbot of Fools, Abbé de la Maligne, and, in Scotland, Master of Unreason. At certain festive seasons the ordinary rules of life were relaxed, and under the direction of a master, a condition of misrule, unreason, folly, topsy turvydom, prevailed.

Abbotsbury. Village of Dorset, England, 10 m. S.W. of Dorchester. Here is the largest swannery in the U.K., covering 25 acres. Pop. 552. See Swan.

Abbotsford. Residence of Sir Walter Scott. Built 1811-24, it is on the right bank of the Tweed,

Abbotsford. Sir Walter Scott's picturesque home near Melrose

3 m. W. of Melrose Abbey. A part of the building has been converted into a museum containing relics of the novelist.

Abbots Langley. Parish and village of Hertfordshire, England. It is 21 m. N.W. of London by L.M.S. Rly. Once a manor of St. Albans Abbey, its church of S. Lawrence contains Norman remains. Nicholas Breakspear, afterwards Pope Adrian IV was born here. Pop. 3,909.

Abbott, EDWIN ABBOTT (1838-1926). British scholar and schoolmaster. Educated at the City of London School and St. John's Col-

lege, Cambridge, Abbott was senior classic in 1861 and afterwards fellow of his college. Having been ordained, he became a schoolmaster, and during 1865-89

was head master of his old school. He wrote sermons, works on divinity text-books for schools, and a Shakespearean Grammar, probably his most popular work. Made a fellow of the British Academy, 1913, he died Oct. 12, 1926.

Abbott, SIR JOHN JOSEPH CALDWELL (1821-93). Prime Minister of Canada.

Sir John Abbott,
Canadian Premier

The son of a clergyman, he became a successful lawyer, and before the Federation of 1867 was a member of the Canadian Parliament and solicitor-general. After 1867 Abbott became a follower of Sir John A. Macdonald, whose cabinet he joined in 1887. In 1891 he succeeded Macdonald as prime minister, but resigned Dec., 1892, and died Oct. 30, 1893.

Abbott, LYMAN (1835-1922). American Congregational divine and publicist. Born Dec 18, 1835 at Roxbury, Massachusetts, he graduated at New York University in 1853, and became pastor at Terre Haute, Indiana, in 1860. In 1888 he succeeded Henry Ward Beecher as minister at Plymouth Church, Brooklyn. In 1893 he became chief editor of *The Outlook*, New York. His books include *A Life of Henry Ward Beecher*; *Dictionary of Religious Knowledge* (with T. J. Conant); *Life and Literature of the Ancient Hebrews*. He died Oct. 22, 1922.

Abbottabad. Chief town of Hazara dist., N.W. Frontier province, Pakistan. It is 63 m. N. of Rawalpindi, and is a military centre. It was named after General Sir James Abbott (1807-96), who was commissioner of Hazara 1845-53. Pop. 8,000.

Edwin A. Abbott,
British scholar
Elliott & Fry

Lyman Abbott,
American divine

ABBREVIATIONS: A CLASSIFIED GUIDE

Over 3,700 abbreviations are here grouped in four sections. As certain abbreviations may have different meanings in different sections, all sections should be consulted for a particular meaning. The lists include all abbreviations used throughout this Encyclopedia.

Abbreviations (Latin *ad*, to; *brevis*, short) are commonly used in both speech and writing to save time and space, though abbreviated forms of proper names, either of persons or of places, may also express affection. Examples are found in Greek, Latin, and other MSS., in ancient inscriptions, and on early medals and coins as on modern ones. Their use has been greatly extended in modern speech and writing. Everyone can and does abbreviate words as he pleases, the only requisite being that the meaning should be understood by those addressed. Hence such contractions in correspondence as *ysr* *ffly* and the economical devices resorted to in newspaper advertisements paid for by the line. Many abbreviations, although more formalised, are of no more than local or transitory significance. Others are of importance only to specialised groups or in connexion with specialised activities, e.g. those used by such bodies as the Freemasons and those used in the printing of knitting instructions or chess problems.

On the other hand, many words have become more familiar in their shortened than in their full

SECTION I General Abbreviations

SECTION II (p. 17 *et seq.*) Associations, Institutions, Titles, Honours, Degrees

SECTION III (p. 21 *et seq.*) War, the Services, Civil Defence

SECTION IV (pp. 26-27) Scientific and Technical

form. Such abbreviations as *bus*, *cab*, *cello*, *maths*, *memo*, *per cent*, *perm*, *phone*, *photo*, *piano*, *pram*, *pub*, *taxi*, and *zoo* require no explanation, being almost accepted as words in their own right. Occasionally an abbreviated form has even acquired a different meaning from that of the full word: thus *navy* is not now a synonym for *navigator*, nor does the colloquial English *blitz* carry precisely the same connotation as the German parent word *Blitzkrieg*.

To the use of initial letters as a form of abbreviation there is no apparent limit. Their popularity has long been a source of jest. In modern times various commercial and industrial firms have been alert to the advantage of using initials in advertising, thereby swelling beyond all computation the number of initial-letter abbreviations now in common currency.

No list of abbreviations, therefore, could ever be called complete. But the list given here does claim to be thoroughly comprehensive in that it gives the standard form of every accepted current abbreviation that the average person may expect to meet or require to use.

Section I. GENERAL ABBREVIATIONS

This section consists of such abbreviations as are likely to be used, heard, or seen every day in business or social intercourse or in general reading—of a newspaper, for example—and do not fall more properly into any of the other three sections. A few of the commoner forms in daily use, e.g. *B.B.C.* and *R.A.*, are included in both Section I and Section II: but, as a rule, absence of any particular abbreviation from Section I should suggest reference to one of the other sections.

A. Ace (cards); adults only (cinema); advance (clock); answer.
a. Accepted; acre(-s); active (grammar); alto; approved.
A. & M. Hymns Ancient and Modern.
A.B. Able-bodied seaman.
abbrev. Abbreviation (-ated).

 yrs. Years; yours.
 Z. Zero.
 Zech. Book of Zechariah.
 Zeph. Book of Zephaniah.
 zl. Zloty.

Section II. ASSOCIATIONS, INSTITUTIONS, TITLES, HONOURS, DEGREES

In this section, in order to save space and unnecessary repetition, those abbreviations which, when conjoined with other initials, stand for Member, Licentiate, Associate, Fellow, or President of an association or society are not usually listed under M., L., A., F., or P. Therefore, if an abbreviation is not found under any of those letters, look under the heading of the second letter in the abbreviation to find the name of the association or society, with the appropriate degrees of membership indicated in bold type. Also included here are various "root" abbreviations common to many localities (e.g. U.D.C. for Urban District Council), where the full abbreviation would normally include a preliminary initial, variable in accordance with the name of the locality. It should also be noted, in connexion with such "root" abbreviations as R.C. (Rowing Club) and D.S. (Dramatic Society), that a preliminary A. may signify Amateur: thus in the town of Z—, the abbreviation Z.A.D.S. would be recognized as signifying the Z— Amateur Dramatic Society. By combining two or more of the "root" abbreviations in this list, e.g. O.U. for Oxford University plus D.S. for Dramatic Society, the inquirer may easily work out for himself the significance of many more abbreviations than could possibly be printed here.

- A. Preceding other initials, may stand for Amateur, Assistant, or Associate.
- A.A. Architectural Association; Associate in Arts; Athletic Association; Automobile Association.
- A.B.A. Amateur Boxing Association.
- A.B.C. Australian Broadcasting Corporation.
- A.C. Advisory Committee; Appeal Court; Assistant Commissioner; Athletic Club.

Section III. WAR, THE SERVICES, CIVIL DEFENCE

The abbreviations that follow are those used by the Navy, Army, the Air Forces, and by the various Civil Defence and other associated Services in wartime. The list is necessarily selective though comprehensive. Decorations with both civilian and military classes are given in Section II.

- A. Acting; administration; assistant; Auxiliary Air Force; Naval Aviation.
 A.A. Anti-aircraft; Army Act.
 A.A.C. Army Air Corps.
 A.A.C.U. Anti-Aircraft Cooperation Unit.
 A.A.D.C. Anti-Aircraft Defence Commander.
 A.A.F. Auxiliary Air Force.
 A.A.G. Assistant Adjutant-General.
 A.A.L.M.G. Anti-aircraft light machine-gun.
 A. & A.E.E. Aircraft and Armament Experimental Establishment.
 A.A.Q.M.G. Assistant Adjutant and Quartermaster-General.
 A.A.S. Auxiliary Ambulance Service.
 A.A.S.C. Army Air Support Control.
 A.B. Able-bodied (seaman); Army Book.
 A.B.C. Air Booking Centre.
 A.B.C.A. Army Bureau of Current Affairs.
 A.B.C.D. America, Britain, China, Dutch East Indies.
 A.B.D.A. American-British-Dutch-Australian area.
 A.B.P.O. Army Base Post Office.
 A.B.T.S. Army Blood Transfusion Service.
 A.C. Aircraft carrier; aircraftman; armoured car, army cooperation.
 A/C. Aircraft.
 A.C.I. Aircraftman, 1st Class.
 A.C.2. Aircraftman, 2nd Class.
 A.C.C. Army Catering Corps.
 A.Cdre. Air Commodore.
 A.Cdt. Air Commandant (W.R.A.F.).
 A.C.F. Army Cadet Force.
 A.C/H. Aircraft-hand.
 A.C.I. Air Council Instruction; Army Council Instruction.
 Ack. Acknowledged.
 A.C.M. Air Chief Marshal.
 A.C.S.E.A. Air Command, South-East Asia.
 A.C.V. Armoured command vehicle.
 A.C.W. Aircraftwoman.
 A.C.W.1. Aircraftwoman, 1st Class.
 A.C.W.2. Aircraftwoman, 2nd Class.
 A.D. Air dispatch; armoured division; assistant director.
 A.D.C. Aide - de - camp; Army Dental Corps.
 A.D.D.L. Airfield Dummy-Deck Landing.
 A.D.G.B. Air Defence of Great Britain.
 Adj. Adjutant.
 Adm. Administration; Adm-ality.
 A.D.M.S. Assistant Director of Medical Services.
 A.D.O.S. Assistant Director of Ordnance Services.

- A.D.R.U.** Air Despatch and Reception Unit.
A.D.S. Advanced dressing station.
Adv. Advance(d).
A.E.A. Air Efficiency Award.
A.E.C. Army Educational Corps.
A.E.F. Allied Expeditionary Force.
A.E.M. Air Efficiency Medal.
A.E.O. Air Engineer Officer.
A.F. Admiral of the Fleet; Allied Forces; Army Form.
A/F. Airfield.
A.F.C. Air Force Cross.
A.F.M. Air Force Medal.
A.F.P.U. Army Film and Photographic Unit.
A.F.S. Air Formation Signals; American Field Service; Army Fire Service; Auxiliary Fire Service.
A.F.V. Armoured fighting vehicle.
A.G. Adjutant-General; air gunner; anti-gas.
A.G.R.A. Army Group, Royal Artillery.
A.H.Q. Air Headquarters.
A.I. Aircraft interception (radar).
A.I.D. Aeronautical Inspection Directorate.
A.I.F. Australian Imperial Forces.
A.I.L.O. Air Intelligence Liaison Officer.
A.K.S. Army Kinematography Service.
A.L.F. Allied Land Forces.
A.L.F.E.A. Allied Land Forces, South-East Asia.
A.L.G. Advanced landing ground.
A.L.O. Air Liaison Officer.
A.L.S. Air Letter Service.
A.M. Air Marshal; Air Member; Air Ministry.
A.M.C. Aircraft Message Control; Armed Merchant Cruiser.
A.M.E.S. Air Ministry Experimental Station.
A.M.F. Australian Military Forces.
A.M.G.(O.T.). Allied Military Government (of Occupied Territories).
Amn. Ammunition.
A.M.O. Air Ministry Order.
A.M.P. Air Member for Personnel.
A.M.T. Air Member for Training.
A.N.S. Auxiliary Nursing Service.
Anzac. Australian and New Zealand Army Corps.
A.O. Army Order.
A.O.A. Air Officer Administration.
A.O.C.(in-C). Air Officer Commanding (in-Chief).
A.O.P. Air Observation Post.
A.O.S. Angle of sight.
A.P. Aiming point; air publication; ammunition point; armour-piercing.
A.P.I.S. Army Photographic Interpretation Section.
A.P.M. Assistant Provost Marshal.
App.Air. Aircraft Apprentice.
A.P.O. Army Post Office.
A.P.S. Army Postal Services.
A.P.T.C. Army Physical Training Corps.
A.Q.M.G. Assistant Quartermaster-General.
A/R. Aircraft Recognition.
A.R.H. Ammunition rail-head.
A.R.O. Army Routine Order.
A.R.P. Air Raid Precautions; ammunition refilling point.
A.R.R.C. Associate of the Royal Red Cross.
Arty. Artillery.
A.R.W. Air raid warden or warning.
ASDIC. Admiralty Submarine Detection Investigation Committee.
A.S.G. Air Support Group.
A.S.H. Argyll and Sutherland Highlanders.
A.S.I. Air speed indicator.
A.S.L. Anti-submarine loops.
A.S.O. Air Staff Officer; Assistant Section Officer.
A.S.P. Air Stores Park.
A.S.R. Air-Sea Rescue.
A.S.S.U. Air Support Signals Unit.
A.S.V. Air to surface vessel (radar).
A.T. Animal Transport.
A/T. Anti-tank.
A.T.A. Air Transport Auxiliary.
A.T.C. Air Training Corps; Air Transport Command (U.S.).
A.T.D. Actual time of departure.
Attero. Atlantic Ferry Organization.
A.T.K. Anti-tank.
A.T.M. Army Training Memorandum.
A.T.S. Auxiliary Territorial Service.
Att. Attached.
A.V.M. Air Vice-Marshal.
A.V.R.E. Armoured vehicle, Royal Engineers.
A/W. All-weather.
A.W.O.L. Absent without official leave.
A.W.S. Army Welfare Services.
B. Balloon Branch; boat-swain; bomb-aimer; bombardment aircraft (U.S.); bomber.
B.A.B.S. Beam Approach Beacon System.
B.A.F.O. British Air Forces of Occupation.
B.A.F.S.E.A. Base Air Forces, South-East Asia.
B.A.O.R. British Army of the Rhine.
B.B. Balloon barrage.
B.B.C. Bromo-benzyl cyanide.
B.C. Battery Commander.
B.C.A.T.P. British Commonwealth Air Training Plan.
B.C.O.F. British Commonwealth Occupation Forces.
B.D. Battle dress; bomb disposal; boom defence.
Bde. Brigade.
Bir. Bombardier.
B.D.S. Bomb disposal squad.
B.D.V. Boom defence vessel.
B.E. Base ejection.
R.E.F. British Expeditionary Force.
B.E.M. British Empire Medal.
B.G.H. Base General Hospital.
B.G.S. Brigadier, General Staff.
B.H.Q. Battalion (or Battery or Battle) Headquarters.
B.L. Breech-loading.
B/L. Bomb-line.
B.L.A. British Liberation Army.
B.M. Beachmaster; Brigade Major.
B.M.H. British Military Hospital.
Bn. Battalion.
B.O.R. British other rank.
Bos'n. Boatswain.
B.O.W.O. Brigade Ordnance Warrant Officer.
B.P.O. Base Post Office.
B.Q.M.S. Battery Quartermaster-Sergeant.
B.R. Book of reference.
B.R.A. Brigadier, Royal Artillery.
B.R.C.S. British Red Cross Society.
B.S.M. Battery Sergeant-Major.
Bt. Brevet.
B.T. British Troops.
B.T.O. Bombing through overcast (radar).
Bty. Battery.
B.W. Black Waten.
C. Captain (R.N.); cargo aircraft (U.S.).
C.A.A.T.O. Commander Army Air Transport Organization.
C.A.G. Civil Air Guard.
C & M. Care and maintenance.
C.A.P. Chloro-aceto-phenone.
Capt. Captain.
C.A.S. Chief of the Air Staff.
Cav. Cavalry.
C.B. Confidential book; confinement to barracks; counter-battery.
C.B.E. Central Bomber Establishment.
C.B.I. China-Burma-India.
C.B.O. Counter-Battery Officer.
C.C. Chief Controller (A.T.S.); Company Commander; Control Commission.
C.C.O. Chief of Combined Operations.
C.C.S. Casualty Clearing Station.
C.C.T.F. Combat Cargo Task Force.
C.D. Civil Defence; Coast Defence.
Cdo. Commando.
Cdr. Commander; Conductor.
C.D.R.C. Civil Defence Regional Commissioner.
C.D.R.S. Civil Defence Rescue Service.
C.D.S. Civil Defence Services.
Cd.S.O. Commissioned Supply Officer.
Cdt. Cadet.
C.D.V. Civil Defence Volunteers.
C.D.W.S. Civil Defence Warden's Service.
C.E. Chief Engineer.
C.F. Chaplain to the Forces.
C.F.I. Chief Flying Instructor.
Cfn. Craftsman.
C.F.S. Central Flying School.
C.G. Cargo glider (U.S.); coastguard; Coldstream Guards.
C.G.I. Chief Ground Instructor.
C.G.M. Conspicuous Gallantry Medal.
C.G.S. Canadian General Staff; Chief of the General Staff.
Ch.G. Chaplain General.
C.H.(L.) Chain home (low) (radar).
Ch. of F. Chaplain of the Fleet.
C.I. Chief Instructor.
C.I.G.S. Chief of the Imperial General Staff.
C-in-C. Commander-in-Chief.
C.K.S. Combined Kinematography Service.
C.M. Cruiser Minelayer.
C.M.B. Coastal motor-boat.
C.M.F. Central Mediterranean Force.
C.M.G. Congressional Medal for Gallantry (U.S.).
C.M.H. Combined Military Hospital.
C.M.P. Corps of Military Police.
C.N.O. Chief of Naval Operations.
C.N.P. Chief of Naval Personnel.
C.N.R. Civil Nursing Reserve.
C.N.S. Chief of Naval Staff.
C.O. Commanding Officer; Command Order(s); Conscientious objector.
C.O.D. Central Ordnance Dept.
C.O.I. Central Office of Information.
C.O.(L.) Chain overseas (low) (radar).
Col. Colonel; column.
Comd. Command (-er, -ing).
Comdt. Commandant.
C.O.M.E. Chief Ordnance Mechanical Engineer.
Comm. Commode.
Comm. Communication.
C.O.O. Chief Ordnance Officer.
C.O.P.P. Combined Operations Pilotage Party.
C.O.S. Chief of Staff.
Cov. Company.
C.P. Command post; common-pointed (shell); culminating point.
C.P.I.C. Combined Photographic Interpretation Centre.
Cpl. Corporal.
C.P.O. Chief Petty Officer; Command Post Officer.
C.Q.M.S. Company Quartermaster-Sergeant.
C.R.A. Commander, Royal Artillery.
C.R.E. Commander, Royal Engineers.
C.R.O. Command Routine Order; Corps Routine Order.
C.R.S. Camp Reception Station.
C.R.U. Civilian Resettlement unit.
C.S.C. Chief of Staff College; Conspicuous Service Cross (U.S.).
C.S.M. Company Sergeant-Major.
C.S.O. Chief Signals Officer.
C.S.S.B. Combined Services Signal Board.

C.T.O. Chief Technical Officer.
C.T.T.B. Central Trade Test Board.
C.U.A.S. Cambridge University Air Squadron.
C.W. Chemical Warfare.
C.W.A.A.C. Canadian Women's Army Auxiliary Corps.
D. Dental Branch (R.A.F.); Deputy; destroyer.
D.A. Delayed action; deputy assistant; diphenyl-chlorarsine; direct action.
D.A.A.G. Deputy Assistant Adjutant-General.
D.A.D. Deputy Assistant Director.
D.A.F. Desert Air Force.
D.A.Q.M.G. Deputy Assistant Quartermaster-General.
D.A.S. Direct air support.
D.B.Ops. Director of Bomber Operations.
D.C. Depth-charge.

- D.C.L.I.** Duke of Cornwall's Light Infantry.
- D.C.M.** Distinguished Conduct Medal; District Court Martial.
- D.C.O.** Dental Clerk Orderly.
- D.C.T.** Depth-charge thrower.
- D.C.W.** Department of Chemical Warfare.
- D.D.** Deputy director; Duplex Drive.
- D.E.M.S.** Defensively equipped merchant ship.
- Det.** Detached; detachment; detonator.
- D.F.** Defensive fire; destroyer flotilla; direction finder (-ing).
- D.F.C.** Distinguished Flying Cross.
- D.F.M.** Distinguished Flying Medal.
- D.F.Ops.** Director of Fighter Operations.
- D.G.** Degaussing; Director-General; Dragoon Guards.
- D.G.D.** Director of Ground Defence (R.A.F.).
- D.G.M.S.** Director-General of Medical Services.
- D.G.O.** Director-General of Organization.
- D.G.P.** Director-General of Production.
- D.G.R.** Director(-General) of Graves Registration.
- D.G.R.D.** Director-General of Research and Development.
- D.G.S.** Director-General of Signals.
- D.G.Tn.** Director-General of Transportation Services.
- D.G.W.I.P.** Director-General of Weapons and Instruments Production.
- D.H.** Director of Hygiene.
- D.Hgs.** Director of Hirsings Service.
- D.I.** Daily Inspection.
- Div.** Division.
- D.I.W.T.** Director of Inland Water Transport Service (Army).
- D.Lab.** Director of Labour.
- D.L.C.O.** Deck Landing Control Officer.
- D.L.I.** Durham Light Infantry.
- D.M.** Diphenyl-amine-chloroarsine; Director of Mechanisation.
- D.M.C.** Director of Military Cooperation.
- D.M.I.** Director of Military Intelligence.
- D.M.O.** Director of the Meteorological Office (R.A.F.).
- D.M.O.I.** Director of Military Operations and Intelligence.
- D.M.Q.** Director of Movements and Quartering.
- D.M.S.** Director of Medical Services (Army).
- D.M.T.** Director of Military Training; driver, mechanical transport.
- D.N.A.** Director of Naval Account.
- D.N.A.D.** Director of Naval Air Division.
- D.N.E.** Director of Naval Equipment.
- D.N.F.T.U.** Day-Night Flying Training Unit.
- D.N.I.** Director of Naval Intelligence.
- D.N.M.S.** Director of Naval Medical Services.
- D.N.R.** Director of Naval Recruiting.
- Do.** Dormier.
- D.O.** Demi-official; Director of Organization; Divisional Order.
- D.O.D.** Director of Operations Division (R.N.).
- D.O.I.O.** Director of Intelligence Operations (R.A.F.).
- D.O.I.S.** Director of Intelligence, Security (R.A.F.).
- D.O.M.** Director of Manning.
- D.O.N.** Director of Navigation.
- D.O.S.** Director of Signals (R.A.F.).
- D.P.** Deep penetration; delivery point; dispersal point; displaced person; drill purposes; Duty Pilot.
- D.P.R.** Director of Public Relations (R.A.F.).
- D.P.S.** Director of Personal Services.
- D.R.** Dead reckoning; dispatch rider.
- D.R.L.S.** Dispatch Rider Letter Service.
- D.R.O.** Daily (or Divisional) Routine Order.
- D.S.** Decontamination Squad; Directing Staff.
- D.S.C.** Distinguished Service Cross.
- D.S.C.D.** Director of Small Craft Disposals.
- D.S.E.A.** Davis submarine escape apparatus.
- D.S.M.** Director of Servicing and Maintenance (R.A.F.); Distinguished Service Medal.
- D.S.O.** Distinguished Service Order.
- D.S.R.** Director of Scientific Research.
- D.T.A.C.F.** Director Territorial Army and Cadet Force.
- D.T.D.** Department of Technical Development.
- D.T.F.** Director of Flying Training (R.A.F.).
- D.T.O.** Director of Operational Training (R.A.F.).
- D.T.T.** Director of Technical Training (R.A.F.).
- Drv.** Driver.
- D.W.A.A.F.** Director of Women's Auxiliary Air Force.
- D.W.D.** Director of Weapon Development.
- D.Z.** Dropping zone.
- E.** Engineer; equipment.
- E.A.** Egyptian Army; enemy aircraft; Engineer Admiral (R.N.).
- E.A.A.S.** Empire Air Armament School.
- E.A.M.** *Ethnikon Apoletherotikon Metapon* (Gr.), National Liberation Front.
- E.A.N.S.** Empire Air Navigation School.
- E.C.** Engineer Captain (R.N.), Escort carrier.
- E.C.F.S.** Empire Central Flying School.
- Ech.** Echelon.
- E.D.** Efficiency Decoration.
- E.E.** Expeditionary Force.
- E.E.I.** Expeditionary Forces Institutes.
- E.E.M.** Expeditionary Forces Message.
- E.E.T.S.** Elementary Flying Training School; Empire Flying Training School.
- E.G.M.** Empire Gallantry Medal.
- E-in-C.** Engineer-in-Chief of the Fleet.
- E.L.A.S.** *Ethnikos Laikos Apoletherotikos Stratos* (Gr.), National Popular Liberation Army.
- E.L.Gr.** Engineer Lieutenant-Commander.
- E.L.S.** Express Letter Service.
- E.M.S.** Emergency Medical service.
- Eng.** Engineer.
- E.N.S.A.** Entertainments National Service Association.
- E.O.** Education (Engineer, Entertainments, Equipment or Establishments) Officer.
- E.R.A.** Engine-Room Artificer.
- E.R.S.** Empire Radio School.
- E.S.O.** Embarkation Staff Officer.
- Estabs.** Establishments.
- E.T.A.** Estimated time of arrival.
- E.T.C.** Emergency Training Centre.
- E.T.D.** Estimated time of departure.
- E.T.O.** European Theatre of Operations.
- E.T.P.S.** Empire Test Pilots' School.
- E.V.T.** Educational and Vocational Training.
- E.W.S.** Emergency water supply.
- F.** Fighter; photographic aircraft (U.S.).
- F.A.A.** Fleet Air Arm.
- F.A.M.O.** Forward Airfield Maintenance Organization.
- F.A.N.Y.** First Aid Nursing Yeomanry.
- F.A.P.** First Aid Party (or Post).
- F.A.U.** Friends' Ambulance Unit.
- F.B.** Fighter-bomber; fire brigade; flying-boat.
- F.C.** Fire control; fleet carrier.
- F.C.O.** Flying Control Officer.
- F.C.P.** Forward Control Post.
- Fd.** Field.
- F.D.B.** Fighter dive-bomber.
- F.D.L.** Forward defended localities.
- F.E.** Flight Engineer.
- F.E.U.** Forward Equipment Unit.
- F.F.** Free French; Frontier Force.
- F.F.F.** Fighting French Forces.
- F.F.I.** Free from infection; French Forces of the Interior.
- F.G.** Fire Guard; Foot Guards.
- F.G.C.M.** Field General Court Martial.
- FIDO.** Fog Investigation Dispersal Operation.
- F.L.** Flight Lieutenant.
- Flak.** *Fliegerabwehrkanone* (Ger.), anti-aircraft fire.
- Flt.** Flight.
- Flt. O.** Flight Officer (W.R.A.F.).
- F.M.** Field Marshal; Flight Mechanic.
- Fmn.** Formation.
- F.M.O.** Fleet Mail Officer.
- F.O.** Flag Officer; Flying Officer.
- F.O.I.C.** Flag Officer in Charge.
- F.O.O.** Forward Observation Officer.
- F.P.** Field punishment; fire picket.
- F.P.O.** Field Post Office.
- F.R.** Fighter reconnaissance.
- F.S.** Field security; field service; Fleet Surgeon; Flight Sergeant.
- F.S.M.O.** Field Service Marching Order.
- F.S.O.** Field Security Officer.
- F.S.P.** Field Security Personnel.
- F.S.P.B.** Field Service Pocket Book.
- F.S.R.** Field Service Regulations.
- F.T.B.** Fleet torpedo bomber.
- F.T.C.** Fleet torpedo officer.
- F.T.S.** Flying Training School.
- Fus.** Fusilier.
- Fw.** Focke-Wulf.
- F/W.** Fair-weather.
- Fwd.** Forward.
- G.** General Staff.
- G.A.F.** German Air Force.
- G.B.** Gunboat.
- G.C.** Gentleman Cadet; George Cross; Group Captain.
- G.C.A.** Ground-controlled approach (radar).
- G.C.C.** Group Control Centre.
- G.C.I.** Ground-controlled interception (radar).
- G.C.M.** General Court Martial.
- G.D.** General duties; ground defence.
- Gdsman.** Guardsman.
- G.E.** Garrison Engineer; Ground Engineer.
- Gen.** General.
- G.G.** Grenadier Guards.
- G.H.Q.** General Headquarters.
- G.I.** General (or Government) Issue (U.S.), hence, colloquially a U.S. soldier.
- G.L.** Gun-layer; gun-laying (radar).
- G.M.** George Medal.
- Gnr.** Gunner.
- G.N.T.C.** Girls' Nautical Training Corps.
- G.O.C.(-in-C.).** General Officer Commanding (-in-Chief).
- G.O.R.** Gun Operations Room.
- G.P.** General purposes.
- Sp.Capt.** Group Captain.
- G.P.O.** Gun Position Officer.
- G.P.R.** Glider Pilot Regiment.
- G.P.T.** General Purposes Transport.
- G.R.** General reconnaissance; Gurkha Rifles.
- G.R.O.** General Routine Order.
- G.S.** General service; General Staff.
- G.S.C.** General Service Corps.
- G.S.O.** General Staff Officer.
- G.S.P.** Good service pension.
- G.T.** Glider tug.
- G.T.C.** Girls' Training Corps.
- G.T.V.** Gun-towing vehicle.
- H.A.** High-angle.
- H.A.A.** Heavy anti-aircraft.
- H.A.C.** Honourable Artillery Company.
- H.C.F.** Honorary Chaplain to the Forces.
- H.D.** Heavy duty; Highland Division; Home Defence; horse-drawn.
- He.** Heinkel.
- H.E.** High explosive.
- H.F.** High-level fighter; Home Fleet; Home Forces.
- H.G.** Home Guard; Horse Guards.
- H.L.I.** Highland Light Infantry.
- H.M.A.C.** His Majesty's Aircraft Carrier.
- H.M.A.S.** His Majesty's Australian Ship.
- H.M.C.S.** His Majesty's Canadian Ship.
- H.M.F.** His Majesty's Forces.
- H.M.I.S.** His Majesty's Indian Ship.

- H.M.N.Z.S.** His Majesty's New Zealand Ship.
H.M.S. His Majesty's Ship.
H.M.T. His Majesty's Transport or Trawler.
H.O. Hostilities only.
How. Howitzer.
H.p. Half-pay.
H.Q. Headquarters.
H.S. Hospital Ship (R.N.).
H.S.M.S. High Speed Minesweeper.
H.T. Hired Transport; horsed transport.
Hvy. Heavy.
- I.** Instructor; Intelligence branch.
I.A. Immediate action.
I.A. Indian Army.
I.B. Incendiary bomb.
I.C. Intelligence Corps; internal combustion.
i/c. In charge; in command.
I.D.C. Imperial Defence College.
I.D.G. Inniskilling Dragoon Guards.

N.A. Naval accounts; naval auxiliary; nursing auxiliary.
N.A.A.F.I. Navy, Army, and Air Force Institutes.
N.A.C. National Air Communications; Naval aircraftman.
N.A.C.D. National Association for Civil Defence.
N.A.R.P.A.C. National Air Raid Precautions for Animals Committee.
N.A.S.C. National Association of Spotters' Clubs.
Nav. Navigator.
N.C.A.C. Northern Combat Area Command.
N.C.C. Non-Combatant Corps, n.c.c. non-commissioned officer.
N.D.C. National Defence Company.
N.F. Night fighter.
N.F.S. National Fire Service.
N.I.D. Naval Intelligence Division.
N.I.T.I. Nose instantaneous, tail instantaneous (bomb).
N.L.O. Naval Liaison Officer.
N.O. Naval officer; navigation officer.
N.O.D. Naval Ordnance Department.
N.O.I.C. Naval officer-in-charge.
N.P.C. Naval Personnel Committee.
N.S. Graduated Royal Naval Staff College.
N.S.A. National Service Act(s).
N.S.C. National Savings Committee.
N.S.O. Naval Staff Officer.
N.T.O. Naval Transport Officer.
N.T.S. Naval Transport Service.
- O.** Observer; officer; operations.
O.A. Ordnance Artificer.
O.A.S. On active service.
O.C. Officer Commanding.
O.C.T.U. Officer Cadet Training Unit.
O.D. Ordnance Depot; other denominations.
O.E.R. Officers' Emergency Reserve.
O.F.C. Operator fire control.
Offr. Officer.
Offag. *Offizierlager* (Ger.), officers' prison camp.
O.F.P. Ordnance Field Park.
O.M.E. Ordnance Mechanical Engineer.

- O.O. Observation Officer; Operation Order; Orderly Officer; Ordnance Officer.
 O.O.W. Officer of the Watch.
 O.P. Observation post.
 Ops. Operations.
 O.R. Operations room; orderly room; other rank.
 Orbat. Order of battle.
 Ora. Ordnance.
 O.R.S. Orderly Room Sergeant.
 O.S. Ordinary Seaman, ordnance services.
 O.S.S. Office of Strategic Services (U.S.).
 O.T.C. Officers' Training Corps.
 O.T.S. Officers' Training School.
 O.T.U. Operational Training Unit.
 OE. Officer in charge of 2nd Echelon.
 O.U.A.S. Oxford University Air Squadron.
 O.W.I. Office of War Information (U.S.).
 O.W.L. Operator, wireless and line.
 P. Patrol-boat; personnel branch (R.A.F.); pursuit aircraft (U.S.).
 p.a.c. Passed advanced class, Military College of Science.
 P.A.C.U. Parachute and Cable Unit.
 P.A.D. Passive air defence.
 Palforce. Persia and Iraq Force.
 Paymr. Paymaster.
 P.B. Patrol boat; patrol bomber.
 P.B.I. "Poor bloody infantry."
 P.C. Paymaster Captain (R.N.). Paymaster Commander.
 P.D.C. Personnel Disposal Centre.
 P.D.G. Paymaster Director-General.
 Pdr. Pounder (guns).
 Pfc. Private first-class (U.S.).
 P.F.F. Pathfinder Force.
 P.H. Purple Heart (U.S. decoration).
 P.I. Point of Impact.
 P.I.A.T. Projector, infantry, anti-tank.
 Pl. Platoon.
 P.L. Paymaster-Lieutenant; plain language.
 Plt. Pilot.
 PLUTO. Pipe-line under the ocean.
 P.M. Paymaster; Provost-Marshall.
 P.M.C. President of the Mess Committee.
 P.M.R.A.F.N.S. Princess Mary's Royal Air Force Nursing Service.
 P.O. Petty Officer; Pilot Officer; Plotting Officer.
 P.O.L. Petrol, oil, and lubricants.
 P.O.R. Personnel Occurrence Report.
 P.O.Tel. Petty Officer Telegraphist.
 P.O.W. Prisoner of war.
 P.P. Petrol point.
 P.P.I. Plan position indicator (radar).
 P.R. Parachute Regiment; photographic reconnaissance; public relations.
 P.R.A. Paymaster Rear-Admiral.
 P.R.I. President of the Regimental Institute.
 Pro. Provost.
 P.R.O. Public Relations Officer.
 P.R.P. Petrol refilling point.
 P.R.U. Photographic Reconnaissance Unit.
 p.s.a. Passed R.A.F. Staff College.
 p.s.c. Passed Staff College.
 P.S.I. Permanent staff instructor; President of the Services Institute.
 P.S.L. Paymaster Sub-Lieutenant.
 P.S.T.O. Principal Sea Transport Officer.
 P.T. Physical Training.
 Pte. Private.
 P.T.I. Physical Training Instructor.
 p.u.n.s. Permanently unfit for naval service.
 P.V. Paravane; patrol vessel; private venture.
 P.W. Prisoner of war.
 P.W.C. Post-War Credit.
 P.W.R. Police War Reserve.
 P.X. Post Exchange (U.S.).
 Pz.Kw. *Panzerkraftwagen* (Ger.), tank.
 Q. Quartermaster's Branch.
 Q.A.I.M.N.S. Queen Alexandra's Imperial Military Nursing Service.
 Q.A.R.N.N.S. Queen Alexandra's Royal Naval Nursing Service.
 Q.D. Quarter Deck.
 Q.E. Quadrant elevation.

			Z. Zero hour.

Section IV. SCIENTIFIC AND TECHNICAL

Here are given such abbreviations used in scientific and technical work as are likely to be met with in general scientific reading by students and amateurs. The branches included are chemistry, physics, electricity, mechanics, radio, aeronautics, engineering.

A. Absolute temperature; ampere; Angström; Argon.	A.I. Appleton layer	B. Baumé; boron; brightness; flux density; magnetic induction.	B.O.T. Board of Trade unit.
a (alpha). Alpha rays; specific rotation.	alt. Altitude.	b. Susceptance.	b.p(t). Boiling point.
Ab Alabamine.	amp. Ampere.	β (beta). Beta rays.	Br Bromine.
Ac Actinium.	a.r. Air resistance.	Ba Barium.	B.R.C. British reinforced concrete.
A.C. Alternating current.	As Arsenic.	Bab. Babington.	B.S.I. British Standards Institution.
A.C.E. Automatic computing engine.	a.s. Airscrew.	B.A.Ohm. British Association unit of resistance.	B.S.S. British Standards Specification.
A.F. Audio-frequency.	A.T. Ampere turns.	B.C. Bayonet cap.	B.S.W. British Standard Whitworth.
A.F.C. Automatic frequency control.	at. Atomic.	B.D.C. Bottom dead centre.	B.S.W.G. Brown & Sharpe, or American, wire gauge.
Ag Silver.	Athodyl. Aero-thermo-dynamic duct.	Be Beryllium.	B.Th.U. British thermal unit.

 Yb Ytterbium.
 Yt Yttrium.
 Z. Impedance.
 Zn Zinc.
 Zr Zirconium.

Abbreviators. Name given to certain officials formerly employed by the popes. They are first mentioned in the 14th century, their work being to outline and prepare the groundwork of papal bulls, briefs, and decrees. They were suppressed when Pius X reformed the papal chancery in 1908. Their number varied, but when they were formed into a college by Sixtus IV (1471-84) it was fixed at 72.

Abd-el-Aziz, MULAI (1878-1943). Sultan of Morocco, 1894-1908. Son of Mulai-Hassan III, his sympathy with European ways led to a rebellion, and the southern tribes proclaimed his brother Mulai Abd-el-Hafid sultan. Abd-el-Aziz sought aid from the Great Powers, but finally abdicated and retired on a pension. He died at Tetuan, June 9, 1943.

Abd-el-Kader (c. 1807-83). Algerian patriot. Born near Mascara, he was a sheriff—i.e. a descendant of Mahomet—and early performed the pilgrimage to Mecca. He was proclaimed ameer of Mascara in 1832, and, after a protracted war against the French, made formal submission to the governor of Algiers, the duc d'Aumale, in 1847. He lived in France until 1852 and at Brussa and Damascus, where he died.

Abd-el-Krim. Moroccan chief: son of a caid of the Beni Uriaghel tribe inhabiting the mountainous Rif country. Employed in 1919 in the office of Native Affairs at Melilla, he quarrelled with General Silvestre, commanding the Spanish troops, and returned to the Rif. In 1921 at the head of a few hundred tribesmen he attacked a Spanish advanced post at Anual and carried it by storm. In the fighting that followed 16,000 of the 19,000 composing the Spanish army were either killed or taken prisoner. By the end of 1924 Abd-el-Krim was in control of all Spanish Morocco except Tetuan. He invaded the French zone, but in 1926 surrendered and was exiled to Réunion. Though permitted in 1947 to reside in France, he escaped to Egypt.

Abd-el-Kuri OR PALINURUS SHOAL. Islet off the S. coast of Arabia. It is a dangerous reef of rock and coral, about 8 m. from the mainland, and a little over 1 m. long. It was discovered in 1835.

Abdera. Ancient Greek town, on the S. coast of Thrace and the Aegean Sea. It was the birthplace of the philosophers Democritus and Protagoras. The inhabitants

were generally considered stupid, and to call a person an Abderite was equal to calling him a fool.

Abd-er-Rahman, variant spelling of Abd-ur-Rahman (q.v.).

Abdication (Lat. *ab*, from; *dicare*, to proclaim). Word applied to the act of sovereigns who voluntarily give up their thrones. Famous examples are those of Edward VIII in 1936, Napoleon in 1814 and 1815, and the emperor Charles V in 1556. Other noteworthy instances are Christina of Sweden, 1654; Ferdinand, emperor of Austria, 1848; Milan of Serbia, 1889; Carol of Rumania, 1940.

Abdiel. Name given by Milton to the seraph who, in *Paradise Lost* (vv. 805-907), withstood Satan and other rebel spirits. "Among the faithless, faithful only he."

Abdomen. Cavity of the body lying between the large horizontal muscle called the diaphragm and

Abdomen. Torso opened to show: 1, Diaphragm. 2, Liver. 3, Stomach. 4, Spleen. 5, Kidneys. 6, Pancreas. 7, Gall Bladder. 8, Large intestine. 9, Small intestine. 10, Rectum. 11, Bladder.

the bones and muscles forming the pelvis. The principal organs contained in the abdomen are the stomach and intestines, liver, spleen, pancreas, kidneys and bladder, and in both sexes organs of reproduction. Anatomists divide the surface of the abdomen into nine regions by means of two horizontal and two vertical lines, the three central regions being termed, from above downwards, the epigastric, umbilical and hypogastric, and those at the sides, the right or left hypochondriac, lumbar, and iliac.

In the lower phyla, or orders, of the animal kingdom there is no persistent distinction between the abdomen and the thorax or chest, though the general body cavity is often composed of two divisions. It may be regarded as beginning with the arthropoda. In the

insects and their allies the abdomen, generally divided from the thorax by a narrow constriction, is usually segmented or divided externally into rings, which may bear appendages, as in the Crustacea. In the human species and in the anthropoids an erect habit has caused the abdomen to become the lower part of the body cavity. Commonly known as the belly, it is enclosed by a muscular body wall, lined by a smooth membrane known as the peritoneum, which facilitates the peristaltic movements of the viscera. See *Anatomy*; *Liver*; *Stomach*, etc.

Abduction (Lat. *ab*, from; *ducere*, to lead). Crime relating to offences against women and children. It is chiefly associated with motives of robbery or unlawful knowledge. There can be no abduction of a male person over the age of 14. Whosoever unlawfully, either by force or fraud, takes away, entices or detains any child under the age of 14 with intent to deprive any person who has the lawful custody of such child of the possession of the child, or with the intent to steal any article upon or about the child, is guilty of felony, and may be sentenced to imprisonment for any period not exceeding seven years.

Where a woman of any age has an interest in any real or personal estate, it is felony to take away or detain her with intent to marry her or know her, and punishable by 14 years' imprisonment. Any person who takes a girl under the age of 18 out of the custody of her parents or other person having the lawful care of her, and with the intention that she should be known, is guilty of a misdemeanour. When the girl is under 16 criminal intent is not necessary, and an offence is committed by anyone who takes her away out of the possession of, and against the will of, her parents or guardians. Any person who detains any woman or girl against her will in any premises with intent that she may be known is guilty of a misdemeanour. These three offences are all punishable by two years' imprisonment.

Abdul Aziz (1830-76). Sultan of Turkey. Born Feb. 9, 1830, second son of Sultan Mahmud II, he succeeded his brother Abdul Mejid in 1861. He devoted his energies chiefly to amassing and squandering wealth, obtaining large sums from the khedive Ismail in return for extended prerogatives and a new law of succession. In 1867 he toured in Europe,

visiting London and Paris. His incapacity and extravagance provoked discontent. He was deposed May 30, 1876, and found dead in his apartments June 4, 1876.

Abdul Hamid I (1725-89). Sultan of Turkey. Son of Sultan Ahmed III, he succeeded his brother Mustapha III in 1773. Early in July, 1774, the Turkish army was defeated by the Russians, and on July 21 Abdul Hamid signed the treaty of Kuchuk Kainarji, involving the loss of Turkish suzerainty over the Crimea and other Tartar districts. Another war, with Russia and Austria, resulted in the fall of Ochakov in 1788 after a long siege. Abdul Hamid died April 7, 1789.

Abdul Hamid II (1843-1918). Sultan of Turkey. Born Sept. 22, 1842, second son of the Sultan Abdul Mejid, he became sultan on Aug. 31, 1876, on the deposition of his brother Murad V. His long reign witnessed many changes in

Abdul Hamid II,
Sultan of Turkey

Turkey, mainly losses of territory and increased foreign control over the Ottoman government and finances. A clever diplomat, he skillfully played off the Powers of Europe against

one another, but his empire was always in disorder, and the Armenian massacres in 1896 won for him the titles of The Great Assassin and Abdul the Damned. In April, 1909, the Young Turks under Enver Bey rose in revolt, and the National Assembly voted his deposition. Accepting his fate without a struggle, he became a state captive at Salonica, and in 1915 he was removed, first to Smyrna and then to Magnesia. Abdul Hamid was largely responsible for the influence gained by Germany in Turkey. He died in Constantinople, Feb. 11, 1918. See Abdul Hamid, Edwin Pears, 1917.

Abdul Ilah, AMEER. Regent of Iraq; uncle of King Feisal II. In April, 1941, while absent from Baghdad, he was deposed by Rashid Ali, a politician with pro-Nazi sympathies, and took refuge

Abdul Ilah,
Regent of Iraq

in Transjordan. After the revolt had been put down by British intervention in Iraq, Abdul Ilah was reinstated and returned to Bagdad on June 1, 1941.

Abdullah, IBN HUSSEIN (b.1882).

Ibn Hussein Abdullah,
King of Transjordan

First king of Transjordan. Born in Mecca, second son of King Hussein of the Hejaz and elder brother of King Feisal I of Iraq, he was recognized in April, 1921, as

ameer of the independent state of Transjordan (from 1949, Jordan). His relationship with the U.K. was established by treaty in 1923, and in 1946 the U.K. recognized Transjordan as a sovereign state, Abdullah assuming the title of king. In 1948 he proclaimed himself king of Palestine also, a step neither approved by other members of the Arab League nor recognized elsewhere. See Transjordan.

Abdul Mejid (1823-61). Sultan of Turkey during the Crimean War. The eldest son of Mahmud II, he succeeded July 1, 1839, when the Turkish army and fleet surrendered to the Egyptian viceroy Mehemet Ali. However, the Great Powers intervened to protect Turkey. Abdul Mejid continued his father's reforms. In 1839 he proclaimed the rights of all subjects irrespective of creed. The status of Christians in Turkey and the general tone of the administration were greatly improved by this edict. He died June 25, 1861.

Abd-ur-Rahman. Name of several Arab rulers. One, a follower of Mahomet, on the death of Omar in 644, refused the caliphate to which he had been nominated. Another was leader of the Saracen hosts which were defeated by Charles Martel at Tours in 732. Three, members of the Ommiad family were caliphs of Cordova. Abd-ur-Rahman I founding this caliphate in 756, after his escape from Bagdad when the city was taken by the Abbasides. Abd-ur-Rahman II, the fourth caliph, was distinguished by his love of luxury and display, and his encouragement of architecture, music, and literature. He died in 852. Abd-ur-Rahman III was caliph from 912-61. He waged many wars against neighbouring rulers, recovered much territory lost by his predecessors, and enlarged the boundaries of his kingdom.

Abd-ur-Rahman (1830-1901). Ameer of Afghanistan. Grandson of the great ameer Dost Mohammed, he was driven out of Afghanistan when he first claimed the succession. In 1880, at the close of the second Afghan War, he was the candidate acknowledged by the British. He proved himself a strong and shrewd ruler, with a thorough understanding of his position as between Russia and Great Britain. He preserved the independence of his country, and his wisdom at the time of the Penjdeh incident in 1885 averted what seemed to be inevitable war between the two Great Powers. On his death, Oct. 3, 1901, he was succeeded by his son Habibullah. See Under the Absolute Amir, Frank A. Martin, 1907.

Abd-ur-Rahman,
Afghan Ameer

Abd-ur-Rahman (1778-1859). Sultan of Morocco 1823-59. His reign is chiefly notable for the abandonment of the claim to tribute levied by the rulers of Morocco on European ships in the Mediterranean. This was to secure them from the attacks of pirates, who became troublesome again as soon as the new arrangement was concluded.

Abecedarian Hymns. Hymns composed in imitation of Hebrew acrostic poetry. In these each verse or part commenced with the first and succeeding letters of the alphabet in their order.

Abecedarians (Lat. *abecedarius*, pertaining to the alphabet). Familiar name of an Anabaptist sect founded in Germany by Nicolaus Storch in the 16th century. They held that all human knowledge prevented men from inwardly hearing God's voice, and refused to learn even the alphabet, or A B C—hence the nickname.

a Beckett, GILBERT ABBOTT (1811-56). English humorous writer and dramatist. Born in London, Feb. 17, 1811, he was educated at Westminster and called to the bar. In 1831 he established Figaro in London, and was a constant contributor to Punch from the start of that journal in 1841 until his death, at Boulogne.

G. A. a Beckett,
English humorist

Aug. 30, 1856. His principal works were *The Comic Blackstone*, 1846; *Comic History of England*, 1857-8; and *Comic History of Rome*, 1852. See *The à Becketts of Punch*, 1903, by his son. Arthur Wilham (1844-1909).

Abed-Nego. Name given in Babylon to the exiled Jew, Azariah (Dan. 1-3), friend of Daniel. He received honour and office from Nebuchadnezzar, until, refusing to worship a golden image, he was thrown into a burning furnace. Having miraculously escaped uninjured, he was restored to office.

Abel. Second son of Adam and Eve. A shepherd, he was killed by his brother Cain because of their two sacrifices Abel's was more acceptable to God (Gen. 4). He is alluded to in the N.T (Matt. 23; Heb. 11).

Abel, SIR FREDERICK AUGUSTUS, BART. (1827-1902). British chemist. Born at Woolwich, July 17, 1827, Abel studied at the Royal College of Chemistry, and afterwards acted as assistant to A. W. Hofmann. He conducted research work in aniline derivatives, and prepared one of the first specimens of gun-cotton made in England. In 1852 he became professor of chemistry at the R.M.A., Woolwich, and four

years later he was appointed chemist to the War Office, retaining this position until

Sir F. A. Abel,
British chemist
Elliot & Fry

process by which perfectly stable gun-cotton can be made. His most important work was the invention, in conjunction with Sir James Dewar, of cordite, which was patented in 1889. The Abel test for petroleum, also known as the closed test, was devised by him. At the time of his death, Sept. 6, 1902, Abel was Director of the Imperial Institute.

Abel, ROBERT (1859-1936). English professional cricketer. Born at Rotherhithe, Nov. 30, 1859, he first played for Surrey in 1881, and during his cricket career made over 70 separate centuries, his highest score being 357 not out against Somerset in May, 1899. In Aug., 1899, he and Hayward in partnership scored 448 against Yorkshire at the Oval. In each of the eight seasons 1895 to 1902 he compiled over 2,000 runs (3,309 in 1901). The "guy'nor," as Abel was generally called, was a mainstay of the Surrey XI until his retirement in 1904. He died Dec. 10, 1936.

Robert Abel,
English cricketer
Elliot & Fry

Abélard, PIERRE (1079-1142). French scholastic philosopher and theologian. Born at Le Pallet, near Nantes, Brittany, he sacrificed his heritage and health to the pursuit of knowledge, becoming a rival to his former master, the dialectician William of Champeaux. A thinker of subtle and commanding intellect, in 1115 he was appointed lecturer at the cathedral school of Notre Dame, Paris, and from all parts of Europe drew students, including Peter Lombard and Arnold of Brescia. In the house of Fulbert, a canon

of Notre Dame, Abélard was tutor to his host's niece, the accomplished and beautiful Héloïse, with whom he fell passionately in love. A son was born, and the two were then privately married in Brittany, with Fulbert's consent. But when Héloïse, in order not to mar Abélard's career in the Church, fled to the convent of Argenteuil, her uncle, in revenge, caused Abélard to be castrated, in the hope that all chance of preferment would be denied him. Thus maimed and humbled, Abélard, whose scholastic fame had made him many enemies, retired to the abbey of S. Denis, and induced Héloïse to take the veil. During the remainder of his life he was continuously pursued with charges of heresy, particularly in reference to his views on the Trinity. Condemned by the synod of Soissons in 1121, he afterwards built a hermitage at Nogent-sur-Seine, and a chapel dedicated to the Holy Ghost. Here he regained some of his former fame.

Appointed abbot of S. Gildas de Rhuy, Brittany, he founded at Nogent the abbey of The Paraclete, appointing Héloïse first abbess. Then were written the famous letters which inspired Pope's Epistle of Eloisa to Abélard, and have served more than anything else to preserve the memory of their writers. Persecuted by Bernard of Clairvaux and others, in 1141 Abélard was condemned for heresy by the council of Sens. It was while on his way to Rome to perform the prescribed penance that when at Cluny he won the friendship of Peter the Venerable, who reconciled him to Bernard and the pope. Broken in health, he died, April 21, 1142, at the priory of S. Marcel near Chalon-sur-Saône. He was buried at The Paraclete, as was Héloïse twenty-two years later. In 1817 the remains of the lovers were interred at Père-Lachaise, Paris.

Abélard's teaching was an appeal to reason against tradition. His works were written in Latin, and first printed in Paris, 1616. A hymn by Abélard, *O quanta qualia!* (O what the joy and the glory must be!) is in popular use in the Church of England.

Bibliography. Biographies: J. McCabe, 1901; J. G. Sikes, 1932. Letters: ed. C. K. Scott-Moncrieff, 1925. Novels: Héloïse and Abélard, George Moore, 1921; Peter Abélard, Helen Waddell, 1933.

Abele (Dutch, *abeel*). Alternative name for the white poplar (*Populus alba*). See Poplar.

Abélard and Héloïse. Tomb in
Père-Lachaise cemetery, Paris

Abel Test. Mode of testing petroleum so as to ascertain the temperature at which it gives off inflammable vapour. The test is named after Sir Frederick Abel and is described in schedule I of the Petroleum Act, 1879.

The object of the test is to find out whether a sample of petroleum is safe under ordinary conditions of storage and use. Experiment showed that oil which gives off inflammable vapour only when

principal members were massacred by Boabdil in the Hall of the Abencerrages in the Alhambra. On this incident Chateaubriand based a play and Cherubim an opera. See Spain: History.

Abeokuta. Town of Nigeria, in the Yoruba territory. Capital of Egba district, on the Ogun river, 60 m. by rly. N. of Lagos, the town, or rather group of towns and villages, covers a large area, and is enclosed by a high mud

wall. Founded in 1825 as a refuge from the incursions of the slave-hunters of Dahomey and Ibadan, the various tribes constituted it a free confederacy while retaining their separate religions and customs. Frequently attacked, notably in 1851 by Gezo, king of Dahomey, it resisted all attempts to capture it.

Greatly improved in recent years, it has courts of justice, government buildings, and waterworks opened in 1914, and is the centre of an active trade in palm oil, rubber, timber, and other local produce and European manufactured goods. Following disturbances in 1914, the Alake, or president of the council of chiefs, placed the district of Egba under the direct control of the Nigerian Government. Pop. 45,763.

Aberaman (Celtic *aber*, mouth). Ecclesiastical district and village of Glamorganshire, Wales. It is contiguous to Aberdare, is served by rly., and there are adjacent collieries. Pop. 15,063.

Aberavon. Town of Glamorganshire, Wales; part of Port Talbot. On the right bank of the Avon, 11 m. E. by S. of Swansea, the town grew with the industrial development of S. Wales, and has large tinplate and engineering works. Cwmavon, with important copper-smelting works, lies about 2 m. to the N.E. Aberavon gives its name to a county division which returns one member to Parliament. Market day, Sat. Pop. 16,848.

Aberbrothock. Old name of the Scottish town of Arbroath (*q.v.*).

Abercarn. Urban district and town of Monmouthshire, England. It is in the Ebbw valley 10 m. N.W. of Newport on the railway, with collieries and iron,

tinplate, and chemical works. Market day, Sat. Pop. 20,123.

Aberconway, CHARLES BENJAMIN BRIGHT McLAREN, 1ST BARON (1850-1934). British coal-owner and politician. Born in Edinburgh, May 12, 1850, son of Duncan McLaren, M.P. for Edinburgh, he was a nephew of John Bright. After a brilliant career at Edinburgh University, he became a successful chancery barrister. He married in 1877 the daughter of a wealthy landowner, Henry Pochin, M.P. Having turned his attention to commerce, he became interested in collieries and ironworks, shipbuilding and railway undertakings. In 1880 McLaren entered Parliament as a Radical; in 1902 he was made a baronet, and in 1911 a baron. He died Jan. 23, 1934. His wife was an active advocate of women's suffrage and kindred movements, and his sons, Henry Duncan and Francis, were both M.P.s in the Parliament of 1910. The latter was

Lord Aberconway,
British politician

accidentally killed while flying in the Royal Flying Corps, Aug. 30, 1917. The former, born April 16, 1879, succeeded as 2nd baron. He was a Liberal M.P., 1906-1922, and became chairman of John Brown, Ltd., and other industrial concerns.

Abercorn. Settlement in Northern Rhodesia. It is about 10 m. S.E. of Lake Tanganyika on the Stevenson Road connecting that lake with Lake Nyasa. Established in 1889, it carries on a considerable trade with the neighbouring tribes. Here on Nov. 14, 1918, remnants of a German force under General von Lettow-Vorbeck surrendered to the British.

Abercorn. Mining district and settlement in Southern Rhodesia. It is connected by rly. with Salisbury, 90 m. S.W.

Abercorn, DUKE OF. Title held by the Hamilton family. It originated in 1603,

when James, eldest son of Lord Claud Hamilton, was created baron of Abercorn. In 1606 the barony became an earldom, and in 1790 a marquessate. James Hamilton

Duke of Abercorn,
succeeded 1913

Abeokuta. Native chiefs about to take their seats around the Alake, President of the Council

the temperature reaches 73° F. represents the minimum of safety. This temperature is known as the flash-point, but it does not follow that oil answering the test is safe under all conditions. The test apparatus is described in the Petroleum Act, 1879. A sample of the oil is gradually heated, until, on the application of a light, a blue flame or flash is seen above the surface of the liquid. The flash is due to the explosion of the mixture of oil vapour and air. There is also an Abel test for nitro-explosives.

Abenaki OR ABNAKI. Name given to a federation of Indian tribes who lived in the district now covered by Maine and New Brunswick. Among them were the Norridgewocks, Penobscots, and Passamaquoddies, names perpetuated in the locality. In the wars between England and France in the 18th century the Abenaki fought for the French, and in 1724 their settlement at Norridgewock was destroyed by the English and the confederacy broken up. A few of them remained in Maine and New Brunswick, where their descendants are still found; others migrated farther into Canada. See American Indians.

Abencerrages. Moorish family which settled in Spain in the 8th century. They attained to a position of influence, but in the 15th century, according to tradition, the

(1811-85) succeeded his grandfather as second marquess in 1818, and was made a duke in 1868. Groom of the stole to the Prince Consort 1846-59, he was lord-lieutenant of Ireland, June, 1866-Feb., 1868, and 1874-76. He died Oct. 31, 1885, and was succeeded by his eldest son James (1838-1913), long the chairman of the British South Africa Company, after whom townships in N. and S. Rhodesia have been named. The 3rd duke, James (b. 1869), became the first governor of Northern Ireland in Dec., 1922, and was re-appointed in 1928, 1934, and 1940, retiring in Sept., 1945.

Abercrombie, LASCELLES (1881-1938). English poet and critic. Born Jan. 9, 1881, at Ashton-upon-Mersey, and educated at Malvern and at Manchester University, he published his first book of poems in 1908. He made frequent use of the dramatic form, as in the *Sale of S. Thomas* (1911, rewritten 1931), *Deborah* (1912), and *Phoenix* (1923); but plot and characterization were subordinate to the expression of

Lascelles Abercrombie, English poet

poetic ideas in virile blank verse. His critical output includes *An Essay Towards a Theory of Art* (1923), *Principles of English Prosody* (1923), *Romanticism* (1926), and *The Principles of Literary Criticism* (1932). He was appointed lecturer in Poetry in Liverpool University in 1919, professor of English Literature at Leeds in 1922 and in the University of London (Bedford College) in 1929, and Goldsmiths' Reader in English at Oxford in 1935. He died on Oct. 27, 1938.

Abercrombie, SIR LESLIE PATRICK (b. 1879). British architect. Since 1913, when he won his first premium in an international competition for re-planning Dublin, he has held a foremost place in the British town-planning movement. In 1935 he was appointed Professor of Town Planning at University College, London. With J. H. Forshaw he prepared for the L.C.C. a plan for the reconstruction of London, and in Dec., 1944, published a further scheme for the controlled development of Greater London. He also prepared plans for the rebuilding of Plymouth and Hull. He was knighted in 1945.

Abercromby, SIR RALPH (1734-1801). British general. Son of a Scottish landowner, he abandoned law for the army in

Sir Ralph Abercromby, R.A. painting by John Hoppner, R.A. National Portrait Gallery

1756. He gained experience in the Seven Years' War and in 1793 went under the duke of York to Flanders. After distinguished service in the West Indies, he was appointed in 1797 to command the troops in Ireland. In 1799 he served under the duke of York in Holland, and in 1801 was given command of the Mediterranean expedition, landing his troops under heavy fire at Abukir Bay (*q.v.*). Wounded in the battle that followed, he died seven days later, March 28, 1801. Abercromby probably did more than any other soldier of his time to restore the discipline of the British army. After his death his wife was made a baroness; the barony became extinct in 1924. *Consult* Sir Ralph Abercromby, Lord Dunfermline, 1861; *History of the British Army*, Sir John Fortescue, 1899-1915, vol. iv.

Aberdare. Urban district and market town of Glamorganshire, Wales. It is 4 m. S.W. of Merthyr Tydfil on the railway. It has coal mines, brickfields, and breweries, and has grown enormously with the development of the local mining industry. Near by are cairns and remains of a British encampment. The electoral div. of Aberdare, returning one M.P., includes the urban dist. of Mountain Ash. Market day, Sat. Pop. 39,780.

Aberdare, HENRY AUSTIN BRUCE, 1ST BARON (1815-95). British statesman. Born at

Lord Aberdare, British statesman

Dufryn, Aberdare, Glamorganshire, April 16, 1815, he was called to the bar in 1837, and in 1852 became Liberal M.P. for Merthyr. He was home secretary in 1868-73, when he was made lord president of the council and raised to the peerage. The Aberdare Mountains in British East Africa were named after him. He died on February 25, 1895. The 3rd baron, Clarence Napier Bruce, born Aug. 2, 1885, a well-known sportsman, succeeded to the title in 1929. He has played cricket for Middlesex, excelled at rackets, and many times represented Great Britain in real tennis, in Bathurst Cup contests.

Aberdeen. Third largest city of Scotland (1940 official estimate). It stands on a bay of the North Sea, between the mouths of the rivers Dee and Don, 130½ m. by rly. N. of Edinburgh. It is the county town of Aberdeenshire, a parl., royal and mun. bor., a county in itself, a university city, and the chief seaport of N. Scotland, and has two main rly. stations (formerly L.M.S. and L.N.E.R.).

Aberdeen formerly consisted of two contiguous towns—the episcopal burgh of Old Aberdeen, extending N. towards the Don, and the royal burgh of New Aberdeen, lying N. and W. of the Dee. These have been amalgamated since 1891. In Old Aberdeen are King's College and S. Machar Cathedral, the nave of which is now a parish church.

New Aberdeen, known as the granite city—sometimes the silver city—because of the predominance of grey granite buildings, has many imposing public edifices, notably Marischal College with a tower 260 ft. high, the municipal and county buildings, the market hall, the post office, the royal infirmary, Trinity or Trades Hall, Gordon College, the grammar school, and His Majesty's Theatre. King's College and Marischal College together form the university of Aberdeen. The city possesses an art gallery and museum, with a "hall of remembrance" attached as a memorial to men of Aberdeen who fell in the First Great War. Cowdray Hall, close by, named after its donor, Viscountess Cowdray of Dunecht, was opened in 1925.

Of the city's ecclesiastical buildings, the principal are the contiguous East and West churches—formerly the church of S. Nicholas—with a spire 190 ft. high, and a peal of 36 bells—and the Roman Catholic cathedral. In Union Terrace are statues of Wallace

1. Marischal College, founded in 1593 by George Keith, Earl Marischal. 2. King's College, founded by Bishop Elphinstone in 1494 and united in 1860 with Marischal College to form the present Aberdeen University. 3. View

of the city from Balnagask. 4. Old Machar Church, or S. Machar's Cathedral. 5. Union Terrace Gardens, with statue of King Edward VII. 6. Fish Market. 7. His Majesty's Theatre and United Free South Church

and Burns in Union Street statues of Victoria and Edward VII in front of Gordon College a statue of General Gordon and in front of the grammar school one of Byron The Mercat (market) cross dates from 1686

Besides the fisheries and fish curing establishments for which Aberdeen is noted, many other important industries flourish in the city There are shipbuilding yards, engineering, chemical granite polishing and paper works and woollen, linen, and cotton factories There is a commodious harbour, with docks covering an area of nearly 97 acres Off the S entrance is Girdleness Lighthouse Municipal undertakings include the tramway system and the water supply Aberdeen's fish market is one of the largest of the United Kingdom The BBC maintains local broadcasting studios There are golf links and several public parks Duthie Park of nearly 50 acres being the largest, and the vicinity of the fine sandy beach has been considerably developed as a pleasure resort, with esplanade and dance hall The corporation baths are among the finest in the country The Hazlehead estate (832 acres), purchased by the corporation in 1920, contains many fine walks, golf courses, and

an intricate maze, the latter a gift to the city from a former lord provost Two members are returned to parliament Pop est 189,000 (1948)

An important place in the 12th century, Aberdeen was granted a charter by William the Lion in 1179 Its people espoused the cause of Robert the Bruce, from whom it received large grants of land, and it was burned by Edward III in 1336 During the Civil War it suffered at the hands of both Royalists and Covenanters out side the city Montrose gained,

4th Earl of Aberdeen He was Prime Minister from 1852 to 1855

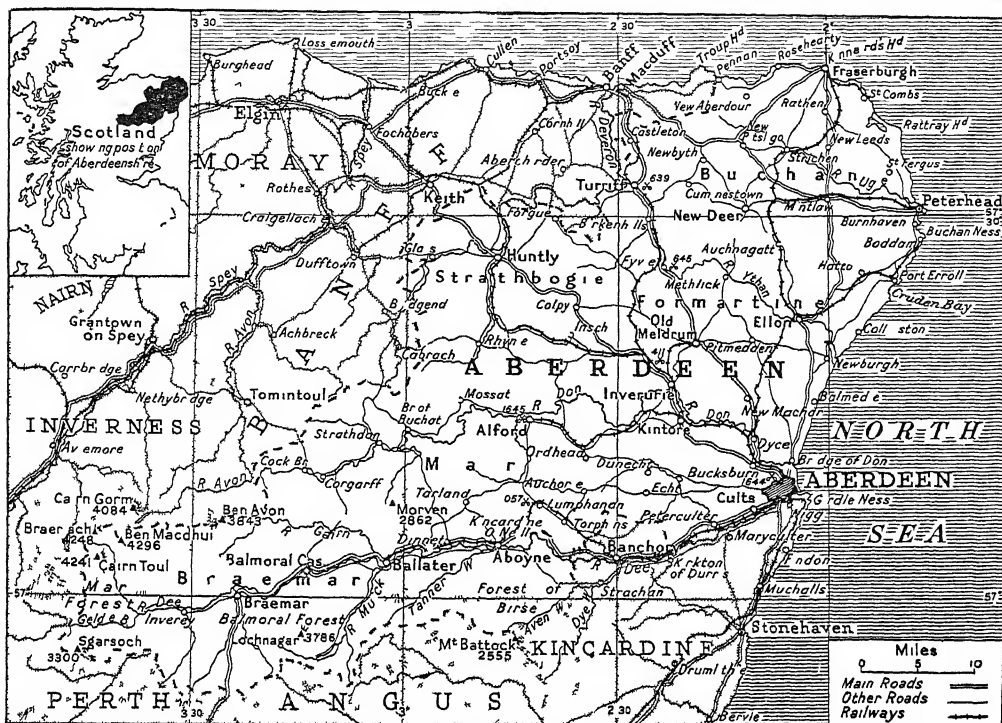

Sept 13, 1644, the second in his series of victories for Charles I, and plundering and massacre followed In 1715 the citizens elected a Jacobite town council, and in 1745 a levy of £1 000 was exacted from the town on behalf of Prince Charles Edward Stuart

The name Aberdeen should properly have been Aberdon ie mouth of the Don The Latin form is Aberdonia and the people of the city are commonly spoken of as Aberdonians

Aberdeen, GLOUCESTER GORDON, 1ST EARL OF (1637-1720) Scottish lawyer Born Oct 3 1637, second son of Sir John Gordon,

Burt, he graduated at King's College, Aberdeen, where he was a professor for four years In 1667 he succeeded to the baronetcy on the death of his elder brother He was made a judge, as Lord Haddo, in 1680, and in 1681 became president of the court of session In 1682 he was made chancellor of Scotland, and created earl of Aberdeen, but was dismissed from the chancellorship in 1684 for toleration towards Non conformists He died at Kellic, April 20, 1720 Aberdeen is supposed to be the hero of the old Scottish song, Cauld Kail in Aberdeen

Aberdeen, GEORGE HAMILTON GORDON, 4TH EARL OF (1784-1860) British statesman Born at Edinburgh Jan 28, 1784 he was educated at Harrow and St John's College, Cambridge In 1801 he succeeded his grandfather as earl of Aberdeen and in 1813 went to Vienna as ambassador, afterwards representing his country at the peace of Paris in 1814 A Tory, he became a cabinet minister under Wellington in 1828, and foreign minister from June of that year until the end of 1830 In 1834 he was for a few months secretary for war and the colonies, and was again appointed foreign minister when

Aberdeenshire With an area of nearly 2,000 square miles and a coast line of 64 miles, it is the sixth in regard to size of the counties of Scotland

Peel returned to office in 1841. He cultivated friendly relations with France at a time when serious trouble existed. He carried through smoothly the Oregon treaty of 1846, which ended a long dispute by fixing the 49th parallel of latitude as the boundary between Canada and the U.S.A., west of the Rocky Mts. He was also prominent in his efforts to avert the disruption of the Church of Scotland.

Aberdeen resigned with Peel in 1846, and after his leader's death was the recognized head of the party which had followed that statesman in his conversion to Free Trade. As such he became prime minister in Dec., 1852. The main event of his term of office was the opening of the Crimean War, into which the ministry was drawn somewhat against the will of its chief. Then came the rumours of suffering in the Crimea and of incompetence in the management of affairs at home. Clearly Aberdeen was not the man to organize the country for a vigorous war, and the passing of a vote of censure on the government was followed in Jan., 1855, by his resignation. He died Dec. 14, 1860, and was succeeded by his eldest son, George John James

Hamilton Gordon (1816-64). There are biographies of Aberdeen by his younger son Lord Stanmore, 1893, and by Lady Frances Balfour, 1923.

Aberdeen, JOHN CAMPBELL GORDON, 1ST MARQUESS OF (1847-1934). British politician. Born Aug. 3, 1847, and educated at St. Andrews and Oxford, he succeeded his brother as 7th earl in 1870. One of Gladstone's intimate friends, he was lord lieutenant of Ireland in 1886, and in 1893-98 governor general of Canada. In 1905 he was lord lieutenant of Ireland, a post he retained until 1915, when on his retirement he was made marquess of Aberdeen and Temair. He had been a

the 1st Lord Tweedmouth whom he married in 1877, was prominent in political and philanthropic circles. She died April 18, 1939. In 1926 a volume of reminiscences by Lord Aberdeen and his wife was published, entitled *We Twa*, followed in 1929 by *More Cracks with We Twa*. Lord Haddo, eldest son of the 1st marquess, succeeded on his father's death. He was born Jan. 20, 1879. Haddo House, Aberdeenshire, is the family seat.

Aberdeenshire. NE maritime co. of Scotland. Bounded N and E by the North Sea, W by Banff and Inverness, and S by Perth, Angus, and Kincardine, it is popularly apportioned into the districts of Braemar, Mar, Strathbogie, Garioch, Formartine, and Buchan. It has an extreme length from NE to SW of 84 m., a greatest breadth of 46 m., and an area of 1,971 sq. m., and is the sixth largest of the Scottish shires.

The coast, 64 m. in extent, is bold and rocky, but almost free from indentations. The chief promontories are Buchan Ness, the most easterly extremity of Scotland, Kinnaird's Head and Rattray Head. The surface is generally hilly, and becomes extremely mountainous in the SW where the Grampians throw out the

Ishbel Maria,
Lady Aberdeen

1st Marquess
of Aberdeen

privy councillor since 1886. He died March 7, 1934. Lady Aberdeen (1857-1939), a daughter of

Cairngorm group, the loftiest summits being Ben Macdhui, 4,296 ft., the second highest peak in Great Britain; Braeriach, 4,248 ft., and Cairntoul, 4,241 ft. Granite and gneiss are the prevailing rocks, the former being largely quarried for building purposes; sandstone is also worked. The largest rivers are the Dee, 87 m.; Don, 82 m.; Deveron, 61 m.; and Ythan, 36 m., all plentifully stocked with salmon and trout, the Ythan and Don also yielding pearl-mussels. Smaller rivers include the Ugie, 21 m.; Bogie, 14 m.; and Cruden, 11 m. Of the few lakes, Loch Muick, 2½ m. long, is the largest.

The surface of the hilly districts is mainly moorland, but in the N.E. and between the Don and Ythan the soil has been made fertile by highly skilful tillage, and is admirably suited for agriculture, oats and barley being the chief crops cultivated. Next in importance to agriculture is the fishing industry, while as stock rearing and feeding country Aberdeen excels. Large numbers of cattle are fattened for home consumption and export, and sheep, pigs, and horses are extensively reared. Of the other industries, several are associated with the quarrying of granite, while fish-curing and the manufacture of woollens, cottons, sailcloth, and paper are actively carried on. The principal towns are Aberdeen, the co. town; Peterhead, the centre of the fisheries; Fraserburgh, Huntly, and Inverurie. East and West Aberdeenshire each send one member to Parliament, and two are returned for Aberdeen city. Balmoral Castle is in the S.W. part of the county. Pop. est. 334,700.

LITERARY ASSOCIATIONS. Lord Byron was taken to Aberdeen in 1790, at the age of two, by his mother, a Gordon, of Gight in Aberdeenshire. Mother and son lived in Broad Street, Aberdeen, till Byron's 11th year during which period the boy attended the city grammar school. A favourite walk was that to the Brig o' Balgownie in Old Aberdeen, from which he used to gaze into the dark waters of the Don beneath. Many of the future poet's holidays were spent in the neighbourhood of Ballater on Deeside, under the shadow of Lochnagar.

Among men of letters associated with the university are James Beattie (1735-1803), philosopher and poet, author of *The Minstrel*, educated at Marischal College; and Smollett, the novelist, M.D. of the same college. A rich treasure-house

of the Aberdeenshire dialect is to be found in Johnny Gibb o' Gusket Neuk, a novel by William Alexander (1826-94). Another Aberdeenshire novelist was George MacDonald (1824-1905). In his *David Elginbrod*, Alec Forbes of Howglen, and Robert Falconer are faithful scenes of the life and manners of this county. A notable volume of poems in the dialect is *Hamewith*, by Charles Murray, 1909.

Aberdeen Terrier. Popular name for the Scotch Terrier (*q.v.*).

Aberdeen University. Consists of King's College and Marischal College and received its present form in 1860. In reality it goes back to 1494, when King's College was founded. Marischal College was founded by George Keith, Earl Marischal, in 1593. The two colleges were independent universities until 1860, and both had the right of conferring degrees. King's College, in Old Aberdeen, possesses a chapel and other 16th century remains. The present Marischal College is a modern building, dating only from 1836. The university has five faculties; arts and divinity are taught at King's College, and science, law, and medicine at Marischal College. It admits women to its degrees, and unites with the other Scottish universities in electing three members to Parliament.

Aberdour. Parish and village of Fife, Scotland. On the Firth of Forth, 18 m. by rly. N.W. of Edinburgh, it is resorted to for sea-bathing, and has a good tidal harbour. Here are the ruins of Aberdour Castle, a seat of the earls of Morton. Pop. 2,055.

Aberdovey. Village and watering place of Merionethshire, Wales. It stands at the mouth of the Dovey, 4 m. S. of Towyn, on the railway. Slate, lead, and copper are worked near by, and visitors are attracted by the quiet of the place and the beauty of its surroundings. Pop. 1,253.

Aberfeldy. Police burgh of Perthshire, Scotland. It stands near the S. bank of the Tay, 32½ m. N.W. of Perth, on the railway. The Falls of Moness, 1 m. distant, are mentioned in Burns's *Birks of Aberfeldy*. The Black Watch was embodied near here in 1740. Market day, Thurs. Pop. 1,505.

Aberfoyle. Parish and village of Perthshire, Scotland. On the Laggan, a head-stream of the Forth, it is 35 m. N.N.W. of Glasgow by the railway, and on one of the routes to the Trossachs. Its scenery is described by Scott in *Rob Roy*. Pop. 1,014.

Abergavenny (Rom. *Goban-nium*). Municipal borough and market town of Monmouthshire.

England. It lies on the river Usk, where the Gaveny joins it, is 23 m. S. of Hereford, and is well served by rlys. It has an old grammar school, the remains of the castle of the Nevilles, and a parish church that was formerly a Benedictine priory. The town suffered severely during the border fighting of the 12th and 13th centuries, being burnt by Owen Glendower (*q.v.*) in 1404. Market days, Tues. and Fri. Pop. 8,608.

Abergavenny, MARQUESS OF. British title borne by the Neville (or Nevill) family. In 1392, Edward Neville, son of the earl of Westmorland, having inherited the estate of Abergavenny, became a baron, and the title was retained by his descendants. In 1784, Baron Bergavenny or Abergavenny was made an earl, and in 1876 the fifth earl was made a marquess. The 4th marquess, G-ly Temple Montacute Larnach-Nevill, born July 15, 1883, succeeded his uncle in 1933. The principal seat of the family is Eridge Castle, Sussex, and the heir to the title is known as the earl of Lewes. *Pron.* Abergenny.

Abergele. Watering place and market town of Denbighshire, Wales. It is situated near the coast between Rhyl and Colwyn Bay, 34 m. N.W. of Chester, on the rly., and with the coastal region of Pensarn forms an urban district. The church contains 15th century glass. Market day, Mon. Pop. 2,651.

Aberfeldy Bridge, built over the Tay in 1733 by General Wade, who held command in the Highlands

Aberglaslyn, PASS OF. One of the beauty spots of N. Wales, it is $1\frac{1}{2}$ m. from Beddgelert, the river Glaslyn flowing between rocky walls that rise steeply to 700 ft. on either side. The river here forms the boundary between Carnarvonshire and Merionethshire.

Abernethy. Police burgh of Perthshire, Scotland, on the estuary of the Tay, 9 m. S.E. of Perth by railway. It has one of the only two ancient round towers in Scotland. Abernethy biscuits were originally manufactured here. Pop. 1,154.

Abernethy, JOHN (1764–1831). British surgeon. Born in London, April 3, 1764, he was educated at Wolverhampton Grammar School. After serving as assistant surgeon and lecturer at St. Bartholomew's Hospital, of which he was surgeon in 1815–29, he was made professor of anatomy and surgery at the College of Surgeons in 1814. Abernethy first enunciated the principle that local diseases are symptomatic, and that most of them arise from disordered digestive organs. Popular and eccentric in manner, he was an excellent medical teacher. He died at Enfield, April 28, 1831.

John Abernethy,
British surgeon
Sir T. Lawrence, P.R.A.

Aberration (Lat. *ab*, from *errare*, to wander). Optical phenomenon of two kinds, spherical and chromatic. Spherical aberration may be defined as follows: When a luminous object is placed opposite a small, spherical, concave mirror, the rays of light falling on the mirror are all reflected back so as to pass through one point on the axis of the mirror. But if the mirror is large the reflected rays no longer pass through a single point, those which arrive from points of the mirror farther from its axis cutting the axis nearer the surface of the mirror and farther away from the luminous source of light.

It is found that all the reflected rays are tangential to a curve which forms two cusps inside the curve of the mirror. This caustic curve, as it is called, can be clearly seen when a bright light shines on the inside of a cup nearly filled with milk, the surface of the milk acting as a screen to intercept the reflected rays from the cup's inner surface. Spherical aberration

of light images from the surface of a concave mirror is the simplest theoretical instance of the aberration which takes place when light passes through lenses compounded of concave and convex surfaces.

Chromatic aberration in lenses is an illustration of a different principle. White light in passing through a prism, that is to say in passing through the medium of the atmosphere into the medium of glass, is bent or deviated at the surface of the glass. It is also dispersed on its emergence from the prism into the band of rainbow colours which are the constituents of white light. When white light, i.e. light of mixed colours and therefore of mixed wave lengths, passes through lenses these laws come into operation. But the amount of dispersion sustained by the different colour constituents of the white light is not the same, and it differs with the character of the glass. Consequently, when light, by which is meant mixed light or light of differing colours and wave lengths, passes through a system of lenses, the image of the source of light is projected in different colours and in different places and in the different aberrations. If all these images are intercepted by a plane surface, such as the retina of the eye or the focusing screen of a camera, they arrive in confusion. This is

chromatic aberration. One effect is the image seen on a dark background which has a rainbow-coloured fringe.

In astronomy, aberration is the displacement of a star, arising from the progressive motion of light combined with the orbital movement of the earth. It provided the basis for determining the speed of light. See *Achromatic Lens*; *Astronomy*; *Light*.

Abersychan. Urban district and village of Monmouthshire, England. It is 10 m. N.N.W. of Newport, is well served by railways, and has a large industrial population engaged in the neighbouring coal mines and tinplate and iron works. Market day, Sat. Pop. 12,321.

Abertillery. Urban district and town of Monmouthshire, England. It is 16 m. N.W. of Newport by railway. It owes its growth to the development of

the adjacent coal mines, and has iron and tinplate works. It gives its name to a division which returns one member to Parliament. Market day, Sat. Pop. 22,281.

Aberystwyth. Mun. borough, market town, seaport and watering place of Cardiganshire, Wales.

Aberystwyth arms

It stands at the junction of the rivers Ystwyth and Rheidol, on Cardigan Bay, 249 m. W.N.W. from London by the railway, though only just over 210 m. by road. It has a pier originally built in 1864, and a promenade extending from Constitution Hill in the N., round Castle Point, to the harbour.

Among a number of public buildings are University College, attached to the University of Wales, and the National Library of Wales, founded in 1907. The college, which embraces many styles of architecture, has a frontage of over 400 ft., and was opened in 1872. The 12th century castle is said to have been built by Gilbert Strongbow, and was used by Charles I as a mint. It was dismantled in 1647, and only a few ruins remain. There are no industries, and the town depends

Aberystwyth. Façade of University College

principally on the revenue obtained from holiday visitors, who are attracted by its fine beach, boating and fishing facilities, and beautiful surroundings. Governed under a charter granted by Henry IV, it was one of the Cardigan parliamentary boroughs till 1885. Market day, Mon. Pop. 9,476.

Abetz, OTTO. Nazi agent, employed as Hitler's "ambassador" in occupied Paris from Aug. 5, 1940, until the abolition of the post in 1942. He remained in liaison with the Vichy govt. until 1944. Tried in 1949 in Paris for war crimes, he received 20 years' imprisonment.

AbeYance (Fr. *à* and *bayer*, to gape at, hanker after). Legal term used when there is uncertainty as to whom rights and titles belong. Typical cases are claims to peerages, the ownership of manorial rights, and the right of presentation to livings. Rights of action are in abeyance until the action is begun or abandoned. In some cases there is a statutory limitation as to the period within which the action must be brought. Proceedings under Lord Campbell's Act (Fatal Accidents Act) must be brought within twelve months and actions for slander within six years. Actions against public authorities, such as county councils, in respect of negligence on the part of any of their servants, or for any official act, must be brought within twelve months.

The word is, however, most commonly used in connexion with peerages. Certain peerages, the old baronies by writ, for instance, pass to heirs general. This means that when there is no male heir they pass to a daughter, but if there is more than one daughter they go into abeyance, because the daughters are all equally co-heirs. The abeyance may be terminated in two ways. Sometimes the co-heirs and their descendants die off until only one is left, who can then claim the peerage. The other way is for the crown to select one of the co-heirs and to call the peerage out of abeyance in favour of her or one of her descendants. Certain restrictions on the power of the crown to call peerages out of abeyance were recognized in 1927. *Consult* Report on Peerages in Abeyance, 1927.

Abgar. Name or official title of 28 rulers of Edessa, in Mesopotamia, 136 B.C.—A.D. 217. Discredited tradition states that Abgar XIV sent a letter to Jesus Christ asking Him to visit him and heal a disease from which he was suffering. This letter, with the reply of Christ, is quoted by Eusebius of Caesarea, who states that Christ promised to send a disciple to Edessa after His ascension.

Abhorrrers. Name given to persons who, in 1679–80, abhorred the agitation for persuading Charles II to call a Parliament. This, it was thought, would pass the bill excluding James, duke of York, afterwards James II, from the throne. Those who devised the Parliament for that purpose were called Petitioners; their leader was the earl of Shaftesbury, and their protégé the duke of

Monmouth. The names originated at the time when public opinion was excited against James and the Roman Catholics. In a sense the Petitioners and Abhorrrers were ancestors of the Whigs and Tories of a later day—the Whigs being the Petitioners and the Tories, or upholders of hereditary right, the Abhorrrers.

Abiathar. Jewish high priest. Son of Ahimelech, who was killed by order of Saul for assisting David, he escaped his father's fate (1 Sam. 22) and became a firm friend to David. In Solomon's time he followed Adonijah in revolting, and was deprived of his office (1 Kings 1 and 2).

Abib. First month of the sacred and 7th month of the civil year of the Jews, corresponding to part of the Christian March–April. Later known as Nisan, it is so called in post-exilic writings. The Passover feast begins on the 15th.

Abigail. Wife of Nabal, a rich boor who refused food to David when he was in the wilderness of Paran. She persuaded David not to punish her husband, and so gained his affection that he married her after the death of Nabal (1 Sam. 25). She proved a faithful and devoted wife, and was the mother of Chilcab (2 Sam. 3), or Daniel (1 Chron. 3). Abigail as a name for a waiting-maid is derived from Abigail's description of herself as David's handmaid. Another Abigail was David's sister and mother of Amasa (2 Sam. 17 and 1 Chron. 2).

Abijah OR **ABIJAM.** Name of several persons mentioned in the O.T. They include a daughter of Zechariah (2 Chron. 29); a son of Rehoboam, (1 Kings 15 and 2 Chron. 13); the second son of Samuel (1 Sam. 8); a son of Jeroboam I, who died in childhood (1 Kings 14); and one of the descendants of Eleazar, after whom was named the eighth of the 24 courses of priests at the Temple. To this John the Baptist's father belonged (1 Chron. 24).

Abimelech. Hebrew name meaning My father is the king, and possibly a royal title. It occurs in the O.T. in connexion with the Philistine king of Gerar (Gen. 20, 21, and 26); and with the son of Gideon, or Jerubbaal, by a woman of Shechemite nationality (Judges 8 and 9), who made himself king by murdering all his brothers except Jotham, who escaped. He was killed at his own request by his armour-bearer, after being fatally wounded by a woman at the siege of Thebez.

Abingdon. Municipal borough and ancient market town of Berkshire England. It is on the Thames, 6 m. S. of Oxford by the railway, and has clothing and carpet factories and a large agricultural trade. Later-established industries include a large motor and engineering works, and at the

Abingdon arms

R.A.F. station here bomber crews and airborne forces were trained during the Second Great War. The grammar school, founded 1563, was rebuilt in 1870;

other antiquities include the remains of a 7th century abbey, which was rebuilt in 955 and became one of the richest in the kingdom, a 15th century bridge, and a 17th century town hall. Abingdon was a prominent town in the 8th century. A parl. borough down to 1885, it now gives its name to a county division which returns one M.P. Pop. 7,240.

Abingdon, EARL OF. English title borne since 1682 by the family of Bertie. It was first held by Francis Norris, Lord Norris, or Norreys, a son of Sir Henry Norris, the diplomatist. He was made an earl in 1620, but died without sons in the same year, when his titles became extinct. His only daughter married Montague Bertie, 2nd earl of Lindsey, and their son James was made earl of Abingdon in 1682. An elder half-brother succeeded to the earldom of Lindsey. From James the later earls are descended. The 8th earl (b. 1887), who succeeded his grandfather in 1928, became also 13th earl of Lindsey in 1938. The eldest son is known as Lord Norreys.

Abingdon, WILLIAM LEPPER PILGRIM (1859–1918). British actor. Born at Towcester, he made his first appearance on the stage at Belfast in 1881, and in London five years later. He won distinction as the villain of many melodramas, chiefly at the Adelphi. From 1906 until his death, May 19, 1918, he lived mainly in America.

Abinger, JAMES SCARLETT, 1ST BARON (1769–1844). British judge. Born in Jamaica, he was educated at Cambridge. Successful as a barrister, he was from 1834 until his death, April 7, 1844,

Lord Abinger,
1st Baron
Sir M. A. Shee, P.R.A.

chief baron of the Exchequer. Scarlett was M.P., first as a Whig and then as a Tory, 1819-35, and at one time attorney-general. In 1835 he was made a peer, the title being still held by his descendants. Abinger's second son was Sir J. Y. Scarlett (1799-1871), the cavalry leader at Balaclava. See Memoir, P. C. Scarlett, 1877.

Abinger. Village of Surrey, 8 m. S.E. of Guildford. Its features are a church with a Norman nave (seriously damaged by enemy action, 1944), a British burial mound, and the stocks on the green. Abinger Hammer, with a clock portraying a smith striking the hours, is the site of a vanished iron industry. The magnetic station of the Royal Observatory was moved in 1924 to Abinger. In the neighbourhood are Crossways Farm, claimed to be the place described in Meredith's *Diana* of the Crossways, and the picturesque hamlet of Friday Street, a popular rendezvous for walkers.

Abington, FRANCES (1731-1815). English actress. Daughter of a private in the Guards, her maiden name was Frances Barton. She was first a flower-seller, then a street singer and reciter at taverns and later servant to a French milliner in Cockspur Street, London. She made her stage debut at the Haymarket as Miranda in Mrs. Centlivre's comedy, *The Busybody*, Aug. 21, 1755, and in 1759 married her music master, Mr. Abington. After five years in Dublin, she was invited by

Mrs. Abington, English actress
Painting by Sir Joshua Reynolds, P. R. A.

David Garrick to Drury Lane, where she remained for 18 years, playing the great ladies of comedy, Shakespearean heroines, romps, and even chambermaids, and creating the part of Lady Teazle in the original production of *The School for Scandal* in 1777. In 1782 she went to Covent Garden, and during 1790-7 was absent from the

stage, on which she made her last appearance, as *Lady Racket* in *Three Weeks after Marriage*, April 12, 1799. She died March 4, 1815.

Abiogenesis (Gr. *a*, not; *bios*, life; *genesis* origin). One theory of the origin of life. The term,

power to many industrial mining concerns. The pulp and paper industry has been greatly developed from the natural resources of the region. Its centre is at Iroquois Falls. Abitibi also includes two lakes, one 60 m. long,

Abinger Hammer. The name of this picturesque Surrey village is a reminder of the iron industry which once flourished here

first used by Huxley in 1870, is opposed to biogenesis. According to it, living matter may take its origin from non-living matter; in other words, there is such a thing as the spontaneous generation of life. See *Biology*; *Life*.

Abipones. South American Indian tribe formerly inhabiting N. Argentina. They are known mainly from the sojourn among them of an 18th-century Jesuit, Dobrizhoffer. They practised tattooing, lip-piercing, ear-piercing, and boy infanticide. Allied in speech to the Guaycurus, they have been absorbed or extinguished by the Toba tribe (*q.v.*).

Abishai. Son of Zeruiah and nephew of King David. A man of remarkable courage, he went with David into the camp of Saul (1 Sam. 26), whom he wished to kill, and fought against Edom in the Valley of Salt (1 Chron. 18). One of the three who risked their lives by entering the Philistine lines to get water for David from the well at Beth-lehem (2 Sam. 23), he also saved the king's life by killing the Philistine giant, Ishbi-benob (2 Sam. 21).

Abitibi. Region of N. Ontario, Canada, through which flows the 200-m. river of the same name, a tributary of the Moose. The Ontario govt. rly. runs parallel to the river for 150 m. There are several hydro-electric power plants within the region, supplying

and a govt. game reserve. Abitibi county, in the province of Quebec, has been an agricultural settlement area since 1912.

Abjuration (Lat. *ab*, from; *jurare*, to swear). In general, renunciation of any kind, more particularly renunciation of an oath of allegiance to a sovereign or creed. In England the word was used of criminals and others who swore to leave the country. The oath of abjuration was an oath imposed by an Act of 1701 on all M.P.s and officials; by it they abjured all allegiance to the Jacobite cause, and promised to maintain the succession to the throne as fixed by the Bill of Rights and the Act of Settlement.

Ablaincourt. Village of France, in the department of Somme. About 8 m. S.W. of Péronne, S. of the river Somme, it figured prominently in the first battle of the Somme (*q.v.*). It was captured by the French Nov. 7, 1916, retaken by the Germans in the spring of 1918, and finally regained by the Allies in Aug., 1918.

Ablain St. Nazaire. Village of France, in the department of Pas-de-Calais, N. of Arras. Severe fighting occurred here in May, 1915. Carried by the French, it remained in their hands throughout the remainder of the war.

Ablainzeville. Village of France in the department of Pas-de-Calais, midway between Albert

and Arras. The Germans gained a footing here in their offensive of March, 1918. For a time heavy assaults were beaten off by the Allies, and much fighting occurred before it was finally taken by the Germans. On Aug. 21, 1918, it was recaptured together with Bucquoy, Courcelles and other places.

Ablative. Grammatical term. It is a case, in the original Indo-European language, used to signify motion from, origin, comparison or the agent. It has survived in Sanskrit and Latin; in Greek its place is supplied by the genitive, in other languages by prepositions. The Latin name is *ablativus casus*, the case connected with taking away.

Ablett, Thomas Robert (1849-1945). British art teacher. Dissatisfied with the official system of art training in schools, he founded in 1885 the Royal Drawing Society, whose examinations are now taken by about 40,000 children each year. His system, based on "snapshot" memory drawing, aimed at developing powers of observation. He died June 5, 1945, aged 96.

Ablution (Lat. *abluerere*, to wash away). Liturgical term for ceremonial washing in religious services, usually as a symbol of the purification of the soul. The law of Moses gives many directions for these washings; and similar practices are general among Mahomedans and Hindus. The term is applied to the cleansing of the sacred vessels after Holy Communion.

Abner. Captain of King Saul's army. After the death of Saul, he supported Ish-bosheth, and then joined David. He was treacherously killed by Joab, and David wrote an elegy to his memory (1 Sam. 14; 2 Sam. 2 and 3). Abner is the name of a character in Racine's tragedy *Athalie*.

Abney, Sir William de Wivelslie (1844-1920). British chemist and physicist. Born at Derby, he was educated at Rossall and the R.M.A. He received a commission in the R.E. in 1861, and was promoted captain in 1873, being at that time instructor in chemistry to the R.E., Chatham.

Sir William Abney,
British chemist
Russell

In 1900, he became adviser in science to the Board of Education. His work became chiefly connected with photography and spectrum analysis, and he contributed

largely to the progress made in colour photography and colour printing. He died Dec. 3, 1920.

Abney Park. District in N. London. It is in the metropolitan borough of Stoke Newington, and has a large cemetery, dedicated May, 1840, and notable for its ancient trees and arboretum. The district is named after Sir Thomas Abney (1640-1722), a London merchant.

Abo, or TURKU. Seaport of Finland, capital of the prov. of Abo-Björneborg, and the former capital of the country. It is on the river Aurajoki, near its mouth on the Baltic Sea, and is 168 m. by rly. from Helsinki. It exports timber, hides, fruit, and eggs, and has shipbuilding yards, is the seat of an archbishop, has a fine cathedral, and its old castle contains a museum. The university formerly at Abo was removed to Helsinki after a fire in 1827. Peace was concluded at Abo between Russia and Sweden in 1743. The town was bombed in the Russo-Finnish war of 1939-40. Pop. 74,351.

Abo, EBOE or IBO. Town of Nigeria. It stands at the head of the Niger delta, and its chief trade is in palm oil.

Abo-Björneborg, or TURKU-PORI. Government or province in S.W. Finland. On the Gulfs of Bothnia and Finland, it has an area of 8,496 sq. m., many lakes, but no important rivers. Abo, the capital, Björneborg and Raumo are the chief towns. Agriculture, cattle-rearing, fishing, and mining are the principal industries, and brewing, distilling, and the manufacture of metal and wooden wares, leather, paper, and tobacco are also carried on. Pop. 522,222.

Abolition Act, or EMANCIPATION ACT. Popular term for the Act for the Abolition of Slavery throughout the British Colonies, passed by the British Parliament on Aug. 7, 1833. It declared slavery to be unlawful "utterly and for ever" on and after Aug. 1, 1834, and allowed a sum of £20,000,000 in compensation to slave owners. An earlier measure abolishing the slave trade had been passed in 1807. See Anti-Slavery Movement; Slave Trade.

Abomey, or AGBOMEY. Capital of the former kingdom of Dahomé, West Africa, now one of the chief centres in the French colony of that name. Situated 63 m. N. of Whydah, W. of the main line rly., it trades in palm oil, ivory, and gold. The French occupied the town in 1892. Pop. 20,000.

Abony. Town and district in Pest-Pilis-Solt-Kiskum county, Hungary. It is 11 miles E. of Czegléd on the rly. between that town and Szolnok, and is a farming centre on the Alföld (*q.v.*). The inhabitants are mostly Magyars; one-sixth are Calvinists, the rest Roman Catholics. Pop. 14,729.

Aborigines (Lat. *ab origine*, from the beginning). Name applied by classical writers to primitive tribes in Italy, perhaps because their ancestors were deemed to have been its earliest inhabitants, sprung from the soil like the Greek autochthones. Modern research establishes the conclusion that they formed part of the neolithic, shortish, brunette, long-headed Mediterranean stock which practised hunting and agriculture on the Italian plains, and were ultimately driven into the Apennine uplands by round-headed Alpine immigrants from the north. Allied to, if not coincident with, the Ligurian race, they probably gave early Rome its Latin dialect and its plebeian population.

The term is now generally used for the peoples found in distant lands by their first European discoverers. The preferable form in the singular is *aboriginal*; this, with its plural, is increasingly used in Australia, the word native being applied to Australian-born whites. In India the most aboriginal tribes are the Andamanese and the pre-Aryan peoples who speak the Austroasian—Munda and Mon-Khmer—languages; the Dravidian-speaking peoples are also ranked as aborigines.

After the Act for the abolition of slavery throughout the British colonies was passed in 1833, reports upon the condition of the aborigines were presented to Parliament in 1834 and 1837. An Aborigines Protection Society was founded in 1837, and a British and Foreign Anti-Slavery Society in 1839. Amalgamated as the Anti-Slavery and Aborigines Protection Society in 1909, it aims at protecting and advancing the interests of enslaved and oppressed native races. Down to the outbreak of the Great War the amalgamated society was concerned with the exposure of the Putumayo atrocities, the amelioration of the labour system in Portuguese West Africa, the abolition of the native system of domestic servitude in Nigeria, the reform of the methods of recruiting native labour in the New Hebrides, and the safeguarding of coolie labour in general.

The protection of aborigines is a matter of constant administrative concern throughout the British

Empire. In Canada, as in the U.S.A., there is a department of Indian affairs; in the Union of South Africa a department of native affairs. Queensland and West Australia appoint a chief protector of aborigines, Papua a commissioner for native affairs, New Zealand a minister representing the native race. There are secretaries for native affairs in Fiji, Gold Coast, and Hong Kong, besides protectors of labour or immigration in some of these and in other parts of over-sea Britain.

Bibliography. Races of man, J. Deniker, 1900; Races and Peoples, D. G. Brinton, 1901; Relations of the Advanced and Backward Races of Mankind, J. Bryce, 1902; Native Races and Their Rulers, C. L. Temple, 1918.

Abors. Primitive Mongoloid tribes inhabiting the Abor hills in the Assam borderlands. They were subdued by a British punitive expedition, 1911-12.

Abortion (Lat. *ab*, from; *oriri*, to arise). Term used in two restricted senses. To physicians it means expulsion of the contents of the uterus or womb, before the child is possibly capable of surviving—that is, at least before the end of the sixth month of pregnancy, and has therefore the same meaning as miscarriage. In law, however, abortion means the artificial expulsion of the uterine contents at any period of pregnancy.

Abortion, in the medical sense, is very common, having been estimated at as much as one-sixth of all deliveries. The most frequent causes are disease or malformation of the mother or infant, acute illness, accident, poisoning—particularly lead poisoning—and shock, grief, or other violent emotion.

H.M.S. Aboukir, sunk by German submarine U9, September 22, 1914

Artificial attempts to procure the condition may be followed by the gravest consequences. In law the essence of the offence is the *intention* to procure abortion, and it is an offence to supply any instrument or drug for the purpose, even though the woman does not use it and is not even pregnant. If a woman dies as the result of criminal abortion, the person responsible may be held guilty of murder.

Aborigines. Top left, a medicine man of Australia with his magic markings; right, Warramungas seeking in the tree grave of a kinsman, lately dead, for traces of the totem of his "killer." Below, natives whose totem is a serpent, building a totem mound to placate their benefactor
From Spencer & Gillen, "Across Australia," Macmillan & Co Ltd.

In a more generalised biological sense abortion occurs when any structure or organ, such as a bud, loses all capacity for further development soon after it has been initiated.

Aboukir, H.M.S. Name in the British Navy, first given to the French 74-gun ship Aquilon, taken at the Battle of the Nile, in 1798. Ships-of-the-line of the same name, of 74 and 90 guns, were launched in 1807 and 1848 respectively, while the fourth Aboukir, belonging to the oldest batch of armoured cruisers in the Navy at the outbreak of the 1914-18 War, was laid down at the Fairfield Yard, Govan, in 1898, and completed in 1902. She had a 12,000-ton displacement, was 440 ft. long and 69 ft. in beam, speed being 21 knots with engines of 21,000 h.p. On Sept. 22, 1914, under the command of Capt. J. E. Drummond, and in company with the Hogue and Cressy, she was torpedoed by the German submarine U9, and sunk, with a loss of 25 officers and 502 men. The Hogue and Cressy were also sunk, the total loss of life being 62 officers and 1,397 men.

About, EDMOND FRANÇOIS VALENTIN (1828-85). French writer. Born at Dieuze, Meurthe,

Feb. 14, 1828, About was educated in Paris, and in 1851 attended the French School at Athens. His stay there inspired his Contemporary Greece, 1854. Tolla, a Tale of Modern Rome, 1854, was widely discussed, and increased About's fame. Other novels from his pen are The King of the Mountains, 1856; Germaine, 1857; Trente et Quarante, 1858; Madelon, 1863; The Man with the Broken Ear, 1861; and The Romance of an Honest Man, 1880. His plays, Guillery, produced at the Théâtre Français, and Gaetana, at the Odéon, were unsuccessful. About's attack on the temporal

Edmond About, French writer

power of the Pope and his anti-clericalism brought him enemies, but he never shrank from controversy, and his book on Alsace, 1872, involved him in trouble

Edmond About

with the Germans, who imprisoned him for a week. In 1872 he was appointed editor of *Le XIXe Siècle*. Elected a member of the French Academy in 1884, he died, Jan. 17, 1885, before installation. About was a gifted journalist; his clear and forcible style has been compared to that of Voltaire, and his talents are seen at their best in his novels. *Pron.* Aboo.

Aboyne, OR CHARLESTON OF ABOYNE. Village and parish, Aboyne and Glentanner, of Aberdeenshire, Scotland. On the Dee, it is 10 m. E. of Ballater, on the railway. Near is Aboyne Castle, the seat of the marquess of Huntly. Pop. of parish, 1,525.

Abra. River in Luzon, Philippine Islands. Rising in the Caballeros range, it empties into the China Sea, and is navigable by small craft for a considerable distance. A prov. of Luzon, rich in minerals, is named after it.

Abacadabra. Magical word or formula derived from Gnostic worship. The first known reference to it is in a work by Serenus Sammonicus, a follower of Basil-

ides of Alexandria, in the 2nd century A.D. It was supposed to conceal the name of God. Usually written on parchment in the form

of an inverted cone, and folded in the shape of a cross, it was worn round the neck as a talisman against sickness or danger. Sometimes, after being worn for nine days, it was thrown over the shoulder into an eastward-flowing stream. *See* Abraxas.

Abraham, PLAINS OF. Heights, close to the city of Quebec, Canada, and on the N. bank of the St. Lawrence river, where Wolfe defeated the French under Montcalm, Sept. 13, 1759. They were named after a pilot called Maitre Abraham. The Plains, on which stands a monument to Wolfe and Montcalm, were dedicated to the public as a park and playground in 1908. *See* Quebec, Capture of.

Abraham OR ABRAHAM. Founder of the Jewish or Hebrew nation. The story of his life, as given in Gen. 11-25, has been the subject of much critical inquiry. Son of Terah, descendant of Shem, and a native of Ur of the Chaldees, possibly Mugheir, in S. Babylonia, his period is conjecturally about 2300 B.C. With his father, his wife Sarai, or Sarah, as her name is spelt in the later part of the narrative, and his nephew Lot, Abraham, whose name is at first spelt Abram, moved from Ur to

Haran, near Edessa. Here Terah died, and thence, under divine guidance, Abraham migrated to Canaan. At Shechem, where it was revealed to him that his seed should possess the land, he raised his first altar to the Almighty.

Driven by famine to Egypt, he there described Sarai as his sister to Pharaoh—as later to Abimelech, king of Gerar—but no serious consequences followed this deception. Returning to Canaan, he gave Lot choice of the Jordan valley for his flocks, and pitched his tent by the oak of Mamre, near Hebron. After rescuing Lot from Chedorlaomer, king of Elam, and being blessed by Melchizedek, Abraham, despairing of an heir, followed the native custom by taking Sarai's Egyptian handmaid, Hagar, as his second wife, and thus became father of Ishmael. Then came the visit of the three heavenly messengers, with the promise of a son to Sarai, and

news of the pending destruction of Sodom and Gomorrah, for the people of which Abraham pleaded with Jehovah. Lot and his family were spared, though Lot's wife, for disobedience, was turned into a pillar of salt.

In due time Sarai bore a son, Isaac; circumcision was instituted, and Abraham's faith was severely tested by the divine command to offer up Isaac as a sacrifice. Sarai was buried in the cave of Machpelah. Abraham then married Keturah, by whom he had six sons; and after arranging the marriage of Isaac and Rebekah, the patriarch passed away, and was buried by Sarai's side in the grave at Machpelah, on the traditional site of which a Christian church and later a mosque were built.

As common ancestor of Arab tribes as well as of the Hebrews, Abraham, by whom the early faith in the one true God was restored,

As related in Genesis 22, God tempted Abraham to offer up his only son Isaac as a burnt offering. But when Abraham stretched forth his hand, and took the knife to slay his son, he was stayed by the angel of the Lord

ABRAHAM STAYED IN THE SACRIFICE OF ISAAC

Painting by Rembrandt at Leningrad

is to Jew and Moslem alike the supreme type of faithfulness, courage, generosity, and wisdom.

Abraham, WILLIAM (1842-1922). British labour leader. After some education at Carnarvon, he entered the coal mines, his father being a miner. Elected in 1886 M.P. for the Rhondda division of Glamorganshire, he retained his seat at several elections. In 1911 he was made a privy councillor. His gifts as a singer won for him the title Mabon. He died May 14, 1922.

Abrahamites. Sect of Syrian heretics. It was founded in the 9th century by Abraham of Antioch, who denied the divinity of Christ. The name was also given in the 18th century to certain deists in Bohemia, who falsely claimed to represent the teachings of John Hus.

Abraham Lincoln. Play by John Drinkwater (*q.v.*) based on the life of the great U.S. president. First produced Oct. 12, 1918, at the Birmingham repertory theatre under the author's direction, it was staged at the Lyric, Hammersmith, the following Feb., and ran there for 466 performances. William J. Rea played the name-part in each production. See Lyric Theatre, Hammersmith; Playfair, Sir Nigel.

Abraham Men. Slang term used in England in the 16th-18th centuries for a class of able-bodied beggars. One of the wards in Bethlem Hospital, London, was for lunatic beggars, and was named after Abraham, probably because of the reference in S. Luke's Gospel to the beggar carried into Abraham's bosom. These lunatics wore a special badge and were allowed to go about begging. Tom o' Bedlam or Abraham Man was the name given to a beggar of this type, and the country became infested with their imitators, known as sham Abrahams or Abram coves.

Abrahams, HAROLD MAURICE (b. 1899). British athlete. Born Dec. 15, 1899, and educated at Repton and Cambridge, he represented Great Britain in the Olympic games 1920-24, winning the 100 metres in the latter year. In 1928 he captained the British athletic team in the Olympic games.

Abrahams, ISRAEL (1858-1925). Jewish author. Born in London, Nov. 26, 1858, he was educated at the Jews' and University Colleges, London. For a time senior tutor at the Jews' College, he became Reader in Talmudic and Rabbinic Literature at Cambridge. He edited The Jewish Quarterly Review, 1889-

1908, and wrote on Jewish life. He died Oct. 6, 1925.

Abraham's Bosom. Figurative expression used by Jews and Christians to signify the abode of the faithful departed. It was so used by Christ in the parable of the rich man and Lazarus (Luke 16). The term is derived from the ancient practice of reclining on couches at meals, so that the head of each guest was leaning towards the bosom of his neighbour. Thus the chief guest was said to recline in the bosom of the host—the place of honour; *e.g.* in John 13 it is recorded that there was leaning on Jesus' bosom one of the disciples, whom Jesus loved.

Abrantes. Fortified town of Portugal, in the district of Santarém. It is on the right bank of the Tagus, 88 m. by rly. N.E. of Lisbon, and is picturesquely placed on a hill. Its castle is mentioned

from waterfalls, in France, Switzerland, Canada, and the United States. Low-grade abrasives are crushed quartz for sandpaper, etc.; quartz sand for plate-glass making and for etching glass and stone; feldspar and quartz for polishing powders, etc.; pumice powder, diatomaceous earth or tripoli for scouring materials; flint pebbles for use in grinding pigments, etc.; and, finally, grindstones, such as those made from the millstone grit of the Pennines, whetstones, hones, etc. See Carborundum; Grinding.

Abraxas. A mystic word engraved on gems anciently worn, sometimes in rings, as amulets. Analogous to abracadabra, the word abraxas dates apparently from the time of the Gnostic Basilides, and the Greek letters composing it, used as numerical characters, represent the number 365, held by the Gnostics to sym-

Plains of Abraham, near Quebec, Canada, showing the monument to Wolfe and Montcalm on the scene of Wolfe's great victory in 1759

by Camoens. It has a trade in oil, fruit, wine, and cereals. Founded by the Iberians about 300 B.C., it was colonised by the Romans. Pop. 8,000.

Abrases. Scouring and polishing materials used in a variety of manufacturing processes. High-grade abrasives are natural minerals, such as emery or corundum, or artificial products of alumina or silicon-carbide, such as carborundum; these materials are largely limited in use to the metal-working industries. Corundum is obtained from Palmer Rapids, Ontario. Corundum Hill, North Carolina, the Leydsdorp district in the Transvaal, and Madagascar. Emery is obtained from Turkey, Naxos, and Peekskill, New York State.

Artificial abrasives are, in general, made by electrical power obtained

bolise the spiritual manifestations of the Supreme Deity, the number of worlds forming the universe, or the number of days in the solar year. Abraxas amulets, which often bear capricious symbols or figures, were largely imitated in medieval times. The word is said to be derived from the Coptic for Holy Name or the Hebrew Ha-Brachah, blessing. See Gnostics; consult also The Gnostics and their Remains, C. W. King, 1887.

Abraxas. A species of moth, best known as the magpie moth (*Abraxas grossulariata*), which destroys the leaves of bush fruit-trees. The grubs are pale in colour, with black spots, and arrive at the usual caterpillar stage in early summer. They are best dealt with when the fruit is in the early stages of formation, and

may be destroyed by the employment of a mixture of lime and soot, after a heavy rain has fallen, when the foliage is wet. When full grown, the Abraxas moth is a little over one inch in length, pale buff in colour, with black spots.

Abrial, JEAN MARIE CHARLES (b. 1888). French naval officer. As vice-admiral in 1940, he assisted with the forces under his command in the Dunkirk evacuation. Under Pétain he became resident-general in Algiers (1940) and secretary of state for the navy (1942-43). In 1946 he was sentenced to 10 years' hard labour for collaboration with the Germans; but this was later halved, and in 1947 he was set at "conditional liberty."

Abrogation (Lat. *ab*, away; *rogare*, to propose). English legal term, meaning the absolute annulment of a law by the proper legislative authority. It must be distinguished from suspension, which is the temporary suspension of the operation of a law; e.g. of the writ of Habeas Corpus in times of revolutionary outbreaks. It must not be confounded with dispensation, the exemption of an individual from compliance with a law. Derogation is taking away part of a law; and subrogation is adding something to it.

Abruzzi, LUIGI AMADEO, DUKE OF THE (1873-1933). Italian explorer and man of science. The third son of Amadeo, duke of Aosta and king of Spain, 1870-73, and cousin to Victor Emmanuel III, king of Italy, he was born in Madrid, Jan. 29, 1873. He ascended Mt. St. Elias, Alaska, July 31, 1897, being the first to do so. He organized an Arctic expedition, 1899-1900, and from his ship, the *Stella Polare*, sent out sledging parties, one of which attained lat. 86° 33' N., beating previous records. His expedition determined the N. coast of Franz Josef Land. In Africa he ascended Mt. Ruwenzori in 1906, and in 1909 he established a new record in mountain-climbing by ascending

Mt. Godwin-Austen, Kashmir, to an alt. of 24,600 ft. Meanwhile he had served in the Italian navy, of which he was commander-in-chief in 1915-17. He also commanded a squadron during the Tripoli war 1911-12. In 1919 he explored the sources of the Webi Shebeli in Abyssinia, and in 1927 surveyed large areas in Abyssinia. He died March 18, 1933.

Abruzzi e Molise. Department or compartimento of central Italy, comprising the provs. of Aquila, Teramo, Chieti, Pescara, and Campobasso. The first four formed the Abruzzi and the last the Molise of the old kingdom of Naples. Its area is 6,387 sq. m. Sloping E. and W. from the Apennines, where rises the Gran Sassa d'Italia (9,600 ft.), it is mainly mountainous, with valleys running N.E. to the Adriatic. Snow lies on the heights all the winter, and the climate is severe. Forests abound, with pastureage lower down, and in the fertile valleys cereals and wine are produced. Cattle, sheep, and pigs are reared, and silk and outlery manufactured. Pop. 1,677,146.

During the Second Great War there was fighting in the dept. from Sept., 1943, to June, 1944, and damage was severe, a number of small towns being razed to the ground by the Germans, who also committed many acts of vandalism during the quiescent winter of 1943-44. Termoli and Ortona were among larger towns badly damaged. Abruzzi e Molise not being rich in antiquities, however,

artistic and historical losses were not great.

Absalom. Third and favourite son of King David (O.T.). His mother was Maacah, daughter of Talmai, king of Geshur. As described in 2 Sam. 13-18, he was renowned for personal beauty and reckless ambition. Absalom's unfilial conduct was David's punishment for his sin with Bath-sheba. Absalom's sister Tamar having been wronged by her half-brother Amnon, Absalom compassed Amnon's death. Exiled by David, he rewarded his father's forgiveness by raising a revolt, in which he was joined by Ahithophel, Bath-sheba's grandfather.

David fled beyond the Jordan, and Absalom, entering Jerusalem, took possession of David's harem. But at the instigation of David's friend Hushai, Absalom's army was routed in the wood of Ephraim. Fleeing on a mule, Absalom was caught by the head in the boughs of a great oak, and there killed by Joab against David's express orders. David's grief—expressed in the words: O my son Absalom, my son, my son Absalom! Would God I had died for thee, O Absalom, my son, my son—was met by Joab's rebuke that David loved his enemies and hated his friends. The so-called Tomb of Absalom near Jerusalem seems to belong to the Greco-Roman period.

Absalom and Achitophel. Famous English satire, written by John Dryden in 1681. Representing the duke of Monmouth as

Abruzzi e Molise. Wild mountainous country in Italy N. of the river Sangro. There was heavy fighting here during the Second Great War
Photo. British Official, Crown Copyright

Absalom and Lord Shaftesbury as Achitophel, the satirist drew remarkable parallels between the times of Charles II and those of David and Absalom, all his contemporary characters and parties being thinly disguised under Biblical names. A Second Part of the satire, 1682, was mainly written by Nahum Tate, Dryden's contribution to it being only about 200 lines.

Abscess (Lat. *ab*, from ; *cedere*, to go away). Collection of pus or matter bounded by tissue called the abscess wall. An acute or inflammatory abscess is due to septic infection by bacteria, and is usually treated by hot fomentations in the earlier stages and incision in the later. A chronic or cold abscess is nearly always a manifestation of tuberculosis (*q.v.*), and may indicate deep-seated disease. *See* Bacteriology ; Inflammation ; Penicillin.

Abscissa. In plotting a graph on squared paper, points on the curve of the graph measured from the horizontal basis or axis are abscissae, those measured from the vertical axis being ordinates. *See* Co-ordinates ; Graph.

Absentee (Lat. *absens*, being away). In general, one who is absent, but the word has come to be specially associated with Irish landlords. Many of these, while continuing to draw their rents from Ireland, lived elsewhere, and the Irish regarded it as a grievance that the money paid by them in rent should be spent in other lands. The problem was an old one, and in Tudor times measures were taken against absentees. For some years in the 18th century the holders of offices in Ireland had their incomes heavily taxed unless they resided in the country. The question was again acute in the 19th century, after the union of the Parliaments had provided an additional reason for absenteeism from Ireland, but it was largely resolved by the gradual transfer of the land from the landlords to the tenants.

Before the Revolution there was a good deal of absenteeism among French landlords. The U.S.A., Canada, Australia, and other new countries have many absentee landlords, owning large tracts of land but living elsewhere.

Absinthe (Greek *apsinthion*, wormwood). High percentage (50 to 85) alcoholic liquor prepared from flower and leaves of *Artemisia absinthium*, or wormwood. To the oil of wormwood angelica, star anise, hyssop, balm, mint, cinna-

mon and other aromatics are added, the artemisia being digested first with spirit and the aromatics for a few days. The resulting infusion is steam-heated with artemisia, balm, and hyssop leaves to extract the chlorophyll which gives a characteristic green colour. The bitter principle in genuine absinthe has toxic characteristics, and manufacture and sale have therefore been controlled in several European countries.

Absolute (Lat. *absolutus*, free). Philosophical term. That which exists in and by itself, independently of all other conditions or relations, and cannot be other than it is. Its opposite is relative.

Absolute Units. Fundamental units, such as the centimetre (length), gram (weight), and second (time), which form the basis of the C.G.S. system of scientific units and from which other units are derived. Absolute temperature is calculated from the absolute zero which, by the laws of thermodynamics, is the lowest temperature that can exist. It is -273.1° centigrade. *See* Units.

Absolution (Lat. *ab*, from ; *solutus*, free). Theological term for the forgiveness of sins, after public or private confession, pronounced by priest to penitent in the name of God. Absolution was recognized by the Jews (2 Sam. 12). The forms used in Christendom vary with the doctrine, but are based on interpretations of Matt. 16 and 18, John 20, Acts 2, 2 Cor. 2 and 5, and James 5. Anglican usage is as prescribed in the Book of Common Prayer. In the Roman Catholic Church there is an office of absolution for the dead. Contrition and, where wrong has been done, restitution are essential to absolution. In law the word implies acquittal. *See* Confession, Auricular.

Absolutism. Condition or principle of rule by a single individual uncontrolled by any other constitutional authority. In practice, the power of an absolute ruler is limited by what his people will endure without revolting. The Tyrants of ancient Greece, such as Polycrates of Samos and Periander of Corinth, and in modern times the Tsar of Russia before the revolution of 1917, are examples of absolute rulers. *See* Government ; Sovereignty.

Absorbent Materials. Materials which have the property of absorbing liquids, gases, heat, light, or sound. In building, bricks, stone, cement and concrete need damp-proofing treatment to

prevent their absorption of water. Bricks vary in their absorbent qualities from 3 per cent of their volume for the hardest blue bricks to 22 per cent for ordinary stock bricks, the average brick absorbing water to about 15 per cent of its volume. Stone varies from $\frac{1}{2}$ per cent for granite to 10 per cent for sandstone and 13 for Portland stone. Absorption in concrete depends upon the proportions and quality of the cement and sand used.

Chemicals used to absorb moisture from the air include sodium chloride and zinc chloride (driers).

For surgical and other purposes cotton is made absorbent by removing from the fibre its natural wax. Waste or unspinnable cotton is boiled with caustic soda leaving a virtually pure cellulose. This is employed for surgical dressings, for making gun-cotton, and in the manufacture of artificial silk.

Gases are absorbed by carbon, especially wood charcoal, in varying proportions. One volume of amorphous (non-crystalline) carbon can absorb as many as 85 vols. of hydrochloric acid or 90 vols. of ammonia, the amount increasing considerably with the temperature. Because of this property, charcoal is used in gas masks as a dyspepsia remedy, and in industrial processes. *See* Adsorption.

Certain materials such as asphalt and bitumen have special capacities for the absorption of heat and have therefore to be insulated against it. Thermal insulation in general is achieved by the presence of inert air cells in fibrous or sponge-like material.

Materials used in the absorption of sound are noted under Acoustics.

Absorption (Lat. *absorbere*, to suck in). Sucking up of a liquid solution throughout the mass of the solid absorbing material.

ABSORPTION OF LIGHT. This is the retention of some part of the light from any luminous source, by the medium air, water, or a transparent or semi-transparent solid through which the light travels. If a luminous body be in a perfect void the energy of its light loses nothing as it travels outwards. But between the stars there is light absorbing matter ; it contains an uncertain quantity of cosmic dust and, it is supposed, some unilluminated matter agglomerated in dark nebulae.

The atmospheres of planets may also be highly absorbent, *e.g.* in the cloudy atmosphere of the planet Venus. But as on the one hand no medium is entirely transparent to light, and always absorbs some

part of its energy, so no body is entirely opaque, for light can penetrate some distance into all bodies. The Röntgen Rays can travel through many bodies which are customarily regarded as opaque to ordinary light rays.

The amount of light absorbed by a body defined as opaque is influenced considerably by the nature of the body's surface. Thus, a polished white or metallic surface reflects the greater part of the light which falls upon it; a black unpolished surface absorbs nearly all of it, because the light penetrating between the particles of the surface layer is unable to escape by reflection and is consequently absorbed. A body's ability to retain the light which falls on it is called its absorptive power. One which absorbed all light radiations of whatever kind would be called a perfectly black body, though no such body exists. Lamp-black, however, nearly fulfils the condition. *See* Light; Spectroscopy.

Absorption of Gases. All the plants which contain chlorophyll absorb their carbon from the carbonic acid of the air, or, if the plants are submerged, from the gas held in solution by the water, which gas is decomposed under the influence of light by the cells which contain chlorophyll. If a water plant is placed in water containing carbonic acid and is exposed to sunshine, bubbles of oxygen are given off from the cut stem or leaf. The carbonic acid is decomposed in the chlorophyll corpuscles in such a way that part of the oxygen is restored to the atmosphere, and the residue combines with the water to form such compounds as starch. A certain temperature is required, and light is indispensable. No carbon is absorbed by green plants in any other way; and there is no instance in nature of the conversion of carbonic acid into similar carbonic compounds.

Liquids are able to absorb gases even when not entering into chemical combination with them. The volume of gas which the unit volume of any liquid—water, oil, liquid metals—can absorb depends on the nature of the gas and on the temperature. The number of unit volumes of a gas which can be absorbed by a unit volume of a liquid at 15° C. is called the *absorption coefficient* of the liquid. The absorption coefficient of carbonic acid in water is 1, of oxygen 0.035, of nitrogen 0.017.

ELECTRICAL ABSORPTION. For any given insulator, or substance which resists the passage of elec-

tricity, there is a dielectric constant which is the ratio of the induction to the electric intensity. But substances other than gases do not *instantaneously* acquire their maximum induction in an electric field. It seems that they require time to absorb the charge; and this phenomenon is called electric absorption. If a Leyden jar be given a charge and its potential is measured, the potential will be found to fall for some time, but will at last become constant. Similarly, if the jar is discharged the whole electric induction does not disappear at once; but successive discharges getting smaller and smaller may be obtained. *See* Absorbent Materials, Adsorption; Gas.

Abstinence (Lat. *abs*, from; *tenere*, to refrain). In common usage the terms total abstinence and total abstainer refer only to persons who abstain from intoxicating liquors. *See* Temperance.

Abstinence, DAYS OF. Days appointed in the churches to be observed by abstinence from flesh food. In the Anglican church the words fasting and abstinence are used indifferently, and fasting or abstinence is enjoined during the forty days of Lent, the twelve Ember days, the three Rogation days, all Fridays except when Christmas Day falls on a Friday, and the eves of certain festivals. In the Roman Catholic church a distinction is observed between fasting and abstinence, and the days of abstinence vary in different countries. The general rule is that all Fridays, the Wednesdays of Advent and Lent, the Ember days, the eves of Christmas, Easter, Pentecost, SS. Peter and Paul, Assumption, and All Saints, are days of abstinence. *See* Fasting.

Abstraction (Lat. *abs*, from; *trahere*, to draw). Philosophical term for the mental process by which one or more particular qualities or characteristics of an object, such as the whiteness of snow, are separated from the rest and considered independently of the substance to which they belong. The notion thus acquired is an abstract idea (whiteness). By means of abstraction we discover what qualities are common to a number of objects, and thus arrive at concepts or general notions.

Abstract of Title. Summary of all dealings affecting title to property. In the sale or purchase of land or houses the chief consideration is what interest the vendor has in the property. The seller must take care to specify exactly what interest he has to

dispose of, and the buyer must take care that he is getting a title that cannot be challenged. *See* Land Laws.

Abstrich (Ger. *abstreichen*, to wipe off). Term used in metallurgy. In the process of refining lead in a reverberatory cupelling furnace, particularly as practised at Freiberg in Germany, a scum collects on the surface of the molten metal. This scum, or *abstrich*, is scraped off, and varies in colour from a dark brown to a light yellow, according to its composition. It is principally litharge, i.e. oxidised lead. *See* Lead.

Abt, FRANZ (1819-85). German song writer. Born Dec. 22, 1819, he was destined to the church, his father being a clergyman, but adopted music as his profession. He wrote more than 200 songs, the best known being *When the Swallows Homeward Fly*. He died at Wiesbaden March 31, 1885.

Abu. Arabic word meaning father, Hebrew *ab*. In some compounds it expresses the actual parental relationship, as *Abu'l Qasim*, the father of *Qasim*; in others, merely possession or close connexion, as *abu en-nom*, father of sleep, the poppy; *abu riyah*, father of winds, weathercock; *abu naddara*, wearer of spectacles. It is common in place-names; for instance, *Mount Abu*.

Abu-Arish. Walled town of Arabia. In the N. of the Yemen, 24 m. from the Red Sea. Pop. 8,000.

Abu-Bekr (573-634). Name, meaning father of the virgin, borne by the first caliph or successor of Mahomet. It was substituted for his original name *Abd-el-Kaba* after the marriage of his daughter *Ayesha* to the Prophet. Born at Mecca, he was a wealthy merchant of the Koreish tribe. He was devoted to Mahomet, his sole companion during the flight from Mecca to Medina, and was designated his successor by the Prophet himself. The claim to the Caliphate put forward by Mahomet's son-in-law *Ali* divided Mahomedans into sects known as Sunnites and Shiites, the supporters of *Abu-Bekr* and *Ali*. *See* Caliph

Abu Debi or **THABI**. Town of S.E. Arabia, on an island in the Persian Gulf, the headquarters of the local pearl fisheries. Pop. 18,000.

Abu-Hammed. Town in the Anglo-Egyptian Sudan. Situated at the great bend of the Nile, 230 m. by rly. S.E. of Wady Halfa, it was captured Aug. 7, 1897, by the Anglo-Egyptian troops. Before the construction of the rly., caravans started from here across the Nubian Desert to Korosko.

Abu Hassan. Hero of the story, *The Sleeper Awakened*, in *The Arabian Nights*. He is a citizen of Bagdad who, entertaining the Caliph unawares, becomes his friend and favourite. A similar story is told of the drunken tinker in the *Induction to Shakespeare's Taming of the Shrew*.

Abukir, ABOUKIR, OR ABU-QIR. Village in Egypt, on Abukir Bay, 14 m. N.E. of Alexandria. Near here Nelson at the battle of the Nile defeated the French fleet,

Rahman III, he wrote his medical *Vade Mecum*, a sort of encyclopedia in 30 sections, the last and most important of which dealt with surgery, hitherto neglected by Moslem authorities. This work, long the standard text-book of European surgery, was one of the foundations on which modern surgical science was built.

Abulfaraj (1226-86). Armenian bishop and writer in Arabic and Syriac, surnamed *Bar-Hebraeus*. Born at Malatia, Armenia, of

Abridgment of the History of the Human Race from the Creation to 1329, and a Geography.

Abul Ghazi (1605-63). Khan of Khiva, said to be a descendant of Jenghiz Khan. He is the author of a genealogical history of the Mongols and Tartars from Adam to his own times. A version from the dictation of a Bokharan merchant was rendered into German and introduced into Europe by some Swedish officers, who had been interned in Siberia.

Abukir. On March 21, 1801, in the battle of Abukir Bay, Egypt, Sir Ralph Abercromby (q.v.), commanding the Mediterranean expedition, defeated the French under Baron de Menou, but was himself mortally wounded, dying a week later

Painting by Philippe Jacques de Loutherbourg, B.A.

Aug. 1, 1798, Napoleon overcame the Turkish army, July 25, 1799, and Abercromby defeated the French, March 21, 1801. In the neighbourhood are extensive Egyptian and Roman remains, including the ruins of Canopus. The old Canopic mouth of the Nile emptied itself into the bay. *See Nile, Battle of the.*

Abu Klea. Name of some wells in the Sudan, on the route from Korti to Metemneh, where the British repulsed the dervishes in 1885. The expedition led by Lord Wolseley was proceeding along the Nile to the relief of Gordon. To save time by avoiding the loop made by the Nile above Dongola, a camel corps under Sir Herbert Stewart was sent across the desert. On Jan. 17 this was attacked at Abu Klea, and on the 19th at Abu Kru, where Stewart was mortally wounded. The little force reached the Nile near Khartum, but was too late to save Gordon.

Abulcasis (d. c. 1013). Arabian physician. Practising at Cordova in Spain, where he was court physician to the Caliph Abd-ur-

Jewish descent, he was distinguished by his knowledge of languages, philosophy, theology, and medicine. Made bishop of Gubas at the age of twenty, he took the name of Gregorius. His best-known writings are a *Chronicle of Universal History* and a commentary on the Syriac version of the Bible.

Abul Fazl (1551-1602). Indian historian. A vizier of the Mogul emperor Akbar, he won fame with his *Akbar Nameh (Book of Akbar)*, consisting of a history of Akbar's reign and an account of the political, civil, and religious institutions of the India of his time. It has been translated from the Persian into English. Abul Fazl was assassinated at the instigation of Akbar's son Selim, afterwards the emperor Jehangir.

Abulfeda, ISMAIL-IBN-ALI (1273-1331). Arabian writer and warrior. Born at Damascus, he distinguished himself as a military leader, especially against the Crusaders. In 1312 he was made prince of Hamah, in Syria. His best-known writings are an

An English translation was published in 1730, and the original text at Kazan in 1825 and St. Petersburg in 1871.

Abulug. River of Luzon, Philippine Islands. It rises in the Cordillera del Norte and flows N.E. some sixty miles to the N. coast of the island, through a valley rich in tobacco, rice, and maize.

Abu Mansur Muwaffaq (d. c. 950). Persian physician. He wrote nearly a thousand treatises on simple drugs and a pharmacopoeia called *The Foundations of the True Properties of Remedies*, in which 585 drugs are described, the information being drawn from Greek, Syriac, Persian, Arabian, and Hindu sources. The first medical book in modern Persian, it is also one of the earliest prose works in that language.

Aburi. Health station, British Gold Coast Colony, 25 m. N.E. of Accra. In the Aquapim Hills, at alt. of 1,400 ft. it has a sanatorium and botanical gardens.

Abushere. Variant spelling of the name of the Persian port Bushire (q.v.).

Abu-Simbel OR **IPSAMBUL**. Locality in Egypt, on the left bank of the Nile, 40 m. N. of Wady Halfa. It is celebrated for its remarkable rock temples of **Rameses II**. The great temple of Ra, 180 ft. deep, has a cliff-hewn façade with four enthroned colossi, 65 ft. high, the largest sculptured figures in Egypt. The smaller temple of Hathor has four standing colossi, 33 ft. The larger colossi represent **Rameses II**; with the smaller are two figures of his queen **Nefrêre**.

Abu-Tellul, **BATTLE OF**. British victory over the Turks. On July 14, 1918, the Turks attacked the British under Allenby on both sides of the river Jordan, N. and E. of Jericho. W. of the river they captured Abu-Tellul, but were driven out an hour later in a counter-attack by the Australian Light Horse, and suffered heavy loss, 350 prisoners being taken, including 276 Germans.

Abu-tig, **ABUTIJ** OR **ABUTIZH** (anc. *Abutis*). Coptic town in Upper Egypt. It is situated on the Nile, 15 m. S.E. of Assiut. In the neighbourhood are rock-tombs and other remains. Pop. 10,500.

Abutilon

Abutilon. Favourite garden and greenhouse shrubs of the mallow family (*malvaceae*), chiefly natives of South America and the West Indies. The flowers agree in the main with those of *hibiscus*, except that there is no second calyx (*epicalyx*) composed of bracts below the flower. The calyx is cup-shaped, cleft into five pointed lobes. The petals are five, attached at the base to a tube consisting of numerous united stamens. The five carpels are connected by their edges, but open separately at the top. The five petals are white, orange, and crimson in the various species. The forms mostly grown are garden hybrids between the natural species, and are preferred because they flower more freely. In Britain they attain heights varying from 4 ft. to 12 ft., and are propagated by means of seeds sown in spring in a mixture of loam and peat. They grow freely in the open in summer, especially in southern counties.

Abyad (Arab. white). Arabic word common in place-names. An example is **Bahr-el-abyad**, the white river, one of the branches

Abu-Simbel. Façade of smaller of the rock temples built by **Rameses II** and dedicated to his consort and to Hathor, female counterpart of Osiris

of the Nile, as distinguished from **Bahr-el-azrek**, the blue river.

Abydos. Ancient city of Asia Minor. It stood on the narrowest part of the Hellespont, opposite **Sestos**. It is associated with **Byron's** poem *The Bride of Abydos*. It was here, opposite **Sestos**, that **Leander** swam the Hellespont to visit **Hero**; and **Xerxes** threw bridges of boats across to transport his army to Europe during the expedition against Greece, 480 B.C.

Abydos. Ancient city of Upper Egypt, near the left bank of the Nile, 350 m. S. of Cairo. The Egyptians called it reliquary hill, because the head of **Osiris** was traditionally interred there. The necropolis was the burial-place of the Egyptian kings for many centuries, the tombs including that of **Menes**, the first historical ruler of Egypt. **Seti I** built the great temple, the **Memnoneion** of **Strabo**, containing a list of kings called the **Table of Abydos**; and

Mineptah built a hall for the Osirian mysteries.

Abydos. Bronze weight inscribed in Phoenician "Found correct by the keepers of the Treasury"

Found at Abydos, Asia Minor

Abyss (Gr. *a*, not; *byssos*, depth, bottom of the sea). Name given by the Jews of the Christian era to a large underground pit, the dwelling-place of the dead and evil and revolted spirits. Here also punishment was meted out to sinners. The word abyss is retained in the Revised Version of the New Testament, but in both versions of the Old Testament deep or bottomless pit is used.

Abu-Simbel. Entrance to the great temple, showing four colossi of **Rameses II**, two on each side, hewn out of the cliff, and 65 ft. in height

ABYSSINIA: LAND OF THE ETHIOPIANS

Evans Lewin, Author of *A Geography of Africa*

For further information see East African Campaign; articles on Addis Ababa and other towns; and the biographies of Haile Selassie, Menelek II, Napier of Magdala, and others

The country of Abyssinia, the official name of which is Ethiopia, is an inland independent empire in N.E. Africa, bounded on the N. by the former Italian colony of Eritrea, W. by the Anglo-Egyptian Sudan, E. by French and British Somaliland, and S. by Kenya (British East Africa) and the former Italian Somaliland.

TOPOGRAPHY. Extending for 900 m. from W. to E. and for about 750 m. from N. to S., Abyssinia resembles a triangle in shape, with the apex towards the N. The area is about 350,000 sq. m. The Abyssinian region, including Abyssinia proper, may be divided into four distinct zones: (a) the narrow maritime plain occupied by the European Powers, extending through Eritrea and French Somaliland to Cape Guardafui, and thence turning S. and widening into the expanse of the former Italian Somaliland and Abyssinian Somaliland; (b) the maritime ranges, generally parallel with the coast; (c) the raised undulating plateaux which culminate in the Harar highlands, and are continued S. in the hilly country which forms the basins of the Webi-Shebeli (Wabi-Shevegli) and the Juba; and (d) the region bordering the Anglo-Egyptian Sudan, which is mountainous, rising gradually from the W., and intersected by numerous deep valleys and remarkable ravines, some nearly 4,000 ft. in depth.

The mountains, which occasionally rise to 15,000 ft., are rugged and precipitous, particularly towards the E. The E. wall of the interior highlands runs due S. until it reaches the valley of the river Hawash. Here the main range bends to the S.W., while another chain continues in the original direction. From this a third range, the Harar, runs E. towards the Gulf of Aden. The loftiest peaks are found in the Simyen range, where the snow-capped summit of Ras Dashan, N.E. of Lake Tsana or Tana, reaches 15,160 ft. The principal rivers forming the head-streams of the Abbai, or Blue Nile, issue from Lake Tsana, near which the Atbara, also a tributary of the Nile, takes its rise. Other rivers are the Hawash, the Takkazyé, and the

various tributaries of the Juba; but none is navigable, except for small craft. The torrential waters of the Blue Nile and the Atbara during the rainy season are largely responsible for the annual Nile flood. In the dry season these rivers almost cease to flow. In spite of its tropical situation, the climate of Abyssinia is usually salubrious and agreeable, owing to the general elevation of the country, although in the deep valleys and on the S. plains the heat is often oppressive. The rainy season proper begins about the middle of June and ends at the beginning of October.

PEOPLE AND LANGUAGE. The population of Abyssinia is estimated at about 8,000,000. The Abyssinians proper are a brown, well-formed people belonging to a Semitic stock, originally from the other side of the Red Sea, and speaking Ethiopic, a language closely allied to the old Sabaean. Ethiopic is the sacred language of the priests, but forms the basis of the present Abyssinian. The modern language of Amhara (Amharic) is the common tongue of the country. The Abyssinians may be divided into four groups: the Gallas in the S. and S.W., who entered Abyssinia early in the 16th century; the Amharas, or

Abyssinians proper, in the central districts, who number about two millions and include the ruling class; the Somalis in Harar, the Somaliland plateau, and the S.E.; and the Danakil or Afars in the E. In addition there are numerous Jewish tribes, called Falashas, who retain many national customs, and also Arabs, Indians, Greeks, Armenians, etc.

RELIGIONS. The Amharas are Christians, and so too are some of the Gallas. The rest of the Gallas, the Somalis, and the Danakil, are Mahomedans, with an admixture of pagans. The Falashas are Jews.

The Abyssinian Church, or Church of Ethiopia, is a branch of the Coptic Church of Egypt, and dates from the 4th century, when Athanasius of Alexandria consecrated Frumentius its first metropolitan or abuna. Since that time the abuna has been a Coptic monk chosen by the Coptic patriarch in Egypt, except when the ruler himself has taken the office. Frumentius found Jewish rites existing with traces of Christianity. The Christianity is still mixed with Judaic and pagan customs, though it approximates somewhat closely to the Greek form, the chief distinction being the profession of Monophysitism—i.e. that in Christ was but one nature, the divine, a heresy adopted in the 5th century. There are many monasteries and convents under the control of native-born bishops. In the 16th

Abyssinia. A country in N.E. Africa, extending for 900 m. from W. to E. and about 700 m. from N. to S., with an estimated population of 8,000,000

and 17th centuries and later, unsuccessful attempts were made to introduce Roman Catholicism; Mahomedanism has been also kept back and Anglican missions have had little success.

CONSTITUTION AND GOVERNMENT. Abyssinia is an empire, ruled by an emperor, termed the Negus Negusti, or King of Kings, to whom the chiefs or governors-general of the twelve political provinces owe allegiance. Under the constitution granted by Haile Selassie in 1931 and restored in 1942, the autocracy of the Negus is modified by a Chamber of Nobles nominated by him, and a Lower Chamber nominated by nobles and local chiefs.

Although by an edict issued in 1907 education was made compulsory for all male children above the age of twelve, there were few educational establishments in the country prior to Haile Selassie's accession.

PRODUCTS AND RESOURCES. Abyssinia is essentially a pastoral and agricultural country, although highly mineralized. The vegetation is governed by elevation. In the S. cotton does well, while farther N., in Kafa, coffee, which derives its name from this district, is indigenous. Coffee is also grown in Harar. Sugar can be grown in the S. zone, and indigo, oranges, and bananas are abundant. The forests produce ebony, mahogany, and other hard woods, as well as acacia and bamboo. The fauna is as varied as the flora. Wild animals are represented by the elephant, lion, wolf, zebra, leopard, and hippopotamus; and domestic animals include the horse, donkey, mule, camel, sheep, ox, and goat. The country is on the whole extremely fertile and suited for the most varied products. The minerals comprise coal, iron, gold, silver, copper, and sulphur, but,

with the exception of gold, are almost unworked. In the S. and S.W. districts gold is found along the river courses and is worked by the Gallas, and in the Walega district there are veins of gold-bearing quartz. Most of the gold extracted is used in the country in the form of ornaments and trinkets. There is a considerable trade in rock salt.

The main avenue of trade is the French-Ethiopian Rly., which runs from the port of Jibuti in French Somaliland to the Abyssinian capital at Addis Ababa, a distance of 486½ m., and was completed in 1917. During the Italian occupation (1936-41) the road system was greatly improved.

In the W. goods are conveyed from Goré to Gambela and thence to Khartum, and farther N. trade passes through Gallabat to Khartum. Normally the exports are approximately valued at £1,250,000 and the imports at £1,000,000 per year. The exports principally consist of coffee, skins and hides, beeswax, ivory, rubber, butter, and herbs.

Salt as Currency

The chief towns are Addis Ababa, the capital, Dire Dawa, Harar, and Gondar. The currency before the Italian conquest consisted of the Maria Theresa dollar and the Menelek or standard dollar, introduced in 1894 and worth about 2s. Bars of salt of a uniform size are a recognized means of exchange, and in most places a system of barter still prevails. The Bank of Abyssinia has its head offices at Addis Ababa. It was chartered in 1905, and is empowered to mint the coinage of the country and to make note issues.

HISTORY. Long prior to the Christian era there was intercourse between Egypt and Ethio-

pia, and according to Abyssinian tradition the queen of Sheba, who visited Solomon, was a ruler of that country. From their son, Menelek, the kings of Abyssinia claim descent. Under the Ptolemys close relations existed with both the Jews and the Greeks. But the rise of the Mahomedan power cut off the Abyssinians from the rest of the world.

Land of Prester John

For some centuries little was heard of the country, but vague rumours reached Western Europe of a Christian kingdom, ruled by a monarch called Prester John. At the end of the 15th century, when Portuguese missionaries first penetrated into the country, it had become divided into several independent and warring states. Pedro de Covilham, who visited Abyssinia in 1490, announced that he had discovered the kingdom of Prester John, and was followed by other Portuguese travellers and missionaries. With the decline of Portugal, Abyssinia was again isolated from Europe, and between the visits of the French physician, C. J. Poncet, in 1698, and the British traveller, James Bruce, in 1769, no European appears to have entered the country. For 300 years a continuous struggle for supremacy was in progress between the three kingdoms of Tigré, Amhara, and Shoa, and the over-lordship was generally secured by the ruler of Amhara.

In 1805 Abyssinia was visited by a British mission. In 1830 Protestant missionaries, notably Dr. Ludwig Krapf, the discoverer of Mt. Kenya, and Bishop Samuel Gobat, were received at the court. In 1838 the missionaries were obliged to leave. In the middle of the 19th century Kassa, an adventurer of great ability, acquired power in Amhara, proclaimed himself emperor as Theodore III and conquered Shoa.

For a time Theodore ruled wisely, but owing to supposed slights received from the British government he turned against the British consul and other British officials and imprisoned them in chains. This action necessitated the sending of an expedition in 1868, under Sir Robert Napier, later Lord Napier of Magdala. Magdala was stormed and taken, April 13, 1868, when Theodore, deserted by his followers, committed suicide. After his death, Prince Kassai, the chief of Tigré, became Negus, and was crowned as Johannes II in 1872, while

ABYSSINIA: PEOPLE AND PLACES OF AN ANCIENT AND STILL PRIMITIVE LAND

Menelek, the son of the former ruler of Shoa, became chief of that province. War with the Khalifa occurred in 1887, when Gondar

Abyssinia. Coin of Menelek II, wise and able ruler from 1889 to 1913

was sacked and burned. On March 9, 1889, the emperor Johannes was killed in battle by the dervishes, and Menelek II became ruler of all parts of the country.

The new emperor was a man of great ability, who maintained the independence of his country. The advance of the Italians from Massawa was resisted by Johannes in 1887, and Menelek, at first favourable, refused to recognize an Italian protectorate. A large Italian force sent against Abyssinia in 1896 was decisively beaten at Adowa, March 1. From that time Menelek consolidated his position, introduced stability into his government, set up a Cabinet in 1907, and kept the empire out of debt. His wife, Taitou, was a woman of great force of character, and during a long illness of Menelek she virtually governed the country. She died Feb. 11, 1918. The death of Menelek, in Dec., 1913, when he was succeeded by Lij Yasu (Ladj Jesu), son of his second daughter, opened a new era. In Sept., 1916, Lij Yasu was deposed, owing to his pro-Turkish sympathies. He died Nov., 1935. Meanwhile his aunt Zauditu (Zeoditu), elder daughter of Menelek, was proclaimed empress, with Ras Tafari as regent and heir to the throne. Abyssinia reverted to Cabinet Government in Aug., 1919, after over a year's personal administration by the regent.

The geographical position of Abyssinia, at the centre of the converging and conflicting interests of Great Britain, Italy, and France, was one of great political importance. The realization of this led Italy in 1923 to give strong support to Abyssinia's application for membership of the

League of Nations. Great Britain and others opposed her admission, on the ground that she was still a feudal state and could not suppress the slave trade; but she was admitted on Sept. 28, 1923, subject to certain conditions as to the control of slavery and of the arms traffic. In 1924, Ras Tafari paid a five months' visit to the principal countries of Europe. In 1928 a treaty of perpetual friendship was signed by Abyssinia and Italy, providing that all disputes between the two countries should be settled by arbitration. In the same year Ras Tafari assumed the title of king (or Negus), and on the death of Zauditu in 1930 was proclaimed emperor under the name of Haile Selassie. His spectacular coronation was attended by representatives of all the great powers. The emperor signed a new constitution in 1931, instituting two chambers of representatives, and announced that slavery was to be abolished over a period of 15-20 years. A department was created (August, 1932) to carry abolition into effect.

Italo-Abyssinian War of 1935-6
The frontiers between Abyssinia and British Somaliland, and Abyssinia and the Anglo-Egyptian Sudan, had been settled by treaties. But the boundary between Abyssinia and Italian Somaliland had never been defined, and in spite of the treaty of 1928 and the exchange in October, 1934, of notes confirming Abyssinian-Italian friendship, continual frontier incidents occurred, culminat-

ing in a clash at Walwal, a watering-place used by the wandering herdsmen of the district, towards the end of November, 1934. An Anglo-Abyssinian commission, investigating pasture lands, and escorted by Abyssinian troops, found 150 Italian native soldiers in possession of Walwal. Though Walwal was shown by every official map as being at least 50 miles inside the Abyssinian border, the Italians claimed that it was in Italian Somaliland. The commission withdrew, but the Abyssinian troops remained. On Dec. 5 the Italians brought up two tanks and three aeroplanes and drove them away. Some 60 Italians and 200 Abyssinians were killed.

Abyssinia immediately protested to the League of Nations, and appealed against alleged aggression on her territory in districts bordering both Italian Somaliland and Eritrea. Italy not only denied the allegations, but demanded compensation for her loss at Walwal and a virtual acknowledgment of Italian suzerainty. In March, 1935, Abyssinia suggested the appointment of a commission of conciliation under the treaty of 1928. Italy agreed, and a commission met in July at Scheveningen in the Netherlands, but its deliberations came to nothing.

In the meantime frontier incidents in the same region continued, and on Oct. 3 Adigrat and Adowa were bombed from Eritrea. Adigrat was occupied on the 5th, Adowa on the 6th. The Council of the League of Nations declared

unanimously on Oct. 7 that Italy had resorted to war in disregard of her covenants, and decided, with less unanimity, on coercion of the aggressor. The supply of arms to Abyssinia was sanctioned, and an embargo was placed on the supply to Italy of arms and certain key-imports (but not including petrol). A boycott of imports from Italy was declared, and all credit facilities to the Italian government were prohibited. These decisions came

Abyssinia. In 1930 Ras Tafari, decked with royal emblems, was crowned emperor under the name of Haile Selassie

into force on Nov. 18, 1935. Italy promptly retorted by banning trade with any nation that acted on the League embargo. Meanwhile she had pressed forward with the war, occupying the holy city of Aksum on Oct. 14. General de Bono, the Italian commander-in-chief, issued a proclamation on Oct. 19 abolishing slavery in occupied Abyssinia. Early in November General Graziani advanced from the S. across the Italian Somaliland frontier. At the end of the month de Bono was replaced by Badoglio. After some setbacks the Italians, with the help of aerial bombing and the use of poison gas from the air, swept on to the occupation of Neghelli (Jan. 22, 1936), Ambi Alagi (Feb. 28), Gondar (April 2), and Dessie (April 15). The emperor fled from Addis Ababa on May 1, reaching Haifa a week later in the British cruiser *Enterprise*, which had taken him off from Jibuti. Badoglio occupied the capital on May 5, the day on which Mussolini announced the end of the war and the annexation of Abyssinia. Graziani occupied Harar and Dire Dawa on May 9, the two Italian forces meeting at Dire Dawa the following day.

Mussolini announced that Abyssinia was now under the rule of king Victor Emmanuel III, who assumed the title of emperor of Ethiopia. Badoglio was appointed viceroy and governor-general. A decree of June 1 constituted the new colony of Italian East Africa by the joining together of Eritrea, Ethiopia, and Italian Somaliland. Haile Selassie made a moving address in person to the Assembly of the League of Nations on June 30, but the League took no further action on his behalf. The arms embargo against Italy was raised on July 14.

Abyssinia. Native chiefs and soldiers swearing allegiance to the emperor Haile Selassie on his restoration in 1941 *Photo, British Official*

Graziani succeeded. Badoglio (created duke of Addis Ababa) as viceroy on June 11, 1936, and was himself succeeded by the duke of Aosta on Nov. 21, 1937. Germany recognized the Italian conquest of Abyssinia on Oct. 25, 1936, and her recognition was followed at intervals by that of most of the other governments, including that of Great Britain (Nov. 16, 1938). But Italy never completely subjugated the province of Gojjam, bordering on the Sudan.

During the occupation Italy amply provided for defensive and offensive operations. A force of at least 300,000 men, with 400 guns and 200 aircraft, was on the spot, and of these some 100,000 were stationed near the Sudan borders. Her position, therefore, in view of the general weakness of the British in East Africa, seemed assured.

The Liberation of 1941

In June, 1940, shortly after Italy's declaration of war against Great Britain, Italian troops invaded the Anglo-Egyptian Sudan, British Somaliland, and Kenya. Italy also used Eritrea as the

base for naval operations on the vital Red Sea communications. These contingencies had, however, been foreseen. In the Sudan, Abyssinian refugees had been trained to be the first modern Abyssinian field force, under able British officers. In Kenya a similar but smaller force had been prepared. To aid the local contingents

South African and Indian forces were landed in Kenya and Indian forces were massed around Kassala, at Gedaref, and on the Red Sea coast, in the Sudan. There were thus two main bases for British operations against Italian East Africa. From Khartum came the forces operating against Eritrea and Northern Abyssinia. From Nairobi came those which conquered the coastal territories of Italian Somaliland and advanced north-west to Addis Ababa.

Early in July, 1940, a handful of British officers and N.C.O.s had crossed the borders of Abyssinia with an important convoy of arms. After trekking for many weeks through mountainous country and jungle they reached their headquarters some 500 miles within the borders of Ethiopia, where they undertook to train Abyssinian patriots in the use of modern firearms and to raise the standard of revolt. The Italians failed to locate the groups of patriots either on the ground or from the air, and never foresaw the growth of a hostile army.

After six months the British officer in charge of the mission was able to report to Haile Selassie that an army was trained, equipped, and ready to attack, and that the men were awaiting the presence of their emperor.

On Jan. 24, 1941, Haile Selassie crossed the border, and unfurled the standard with ceremonial and religious ritual. Drum telegraph carried the news throughout the land, and the revolt of the patriots began. Besides the two armies of the N. (patriots and Imperial troops) and south (patriots and South African troops) two other forces attacked, one from the E. and one from the S.E. The operations in Abyssinia took the form

Abyssinia. British officers with some of the troops they trained secretly before the campaign of 1941

of a great pincer movement aimed at the capture of Addis Ababa and the reduction of Amba Alagi, where the duke of Aosta was finally trapped.

The Abyssinian campaign was marked by continuous fighting and some considerable battles, particularly the great fight at Keren to secure the domination of Asmara and the coasts of Eritrea. In the final stages of the war, towns and villages were kept perpetually under artillery fire, the R.A.F. co-operating.

The duke of Aosta, as Italian C.-in-C., decided to make his last stand by withdrawing to the Abyssinian highlands in the hope that the spring rains would paralyse any advance. On April 5, 1941, the British entered Addis Ababa, a handful of men taking over a capital in which were 10,000 Italian troops and police. This was the virtual end—although Gondar (*q.v.*) held out until Nov. 27, 1941—of the Italian adventure.

An agreement was signed by the British and Ethiopian governments restoring diplomatic relations between the two countries, and providing for the services of British finance and personnel in the restoration of the emperor's

administration. The agreement was confirmed, with modifications due to progress, by the signing of a further two-year pact in Dec., 1944. The Italian decrees abolishing slavery and forced labour were maintained, and, pending the restoration in 1942 of the 1931 constitution, the emperor governed by decrees having the force of law. On Oct. 9, 1942, Abyssinia adhered to the pact of the United Nations, and on Dec. 4 of the same year she declared war on Germany, Italy, and Japan. See East African Campaign.

At the present time Abyssinia, quite apart from its economic value as a country of great potential wealth, still largely undeveloped, occupies a position of great political and strategic importance as the guardian of the head-waters of the Nile upon which the prosperity of Egypt so intimately depends.

Bibliography. History of Abyssinia, A. H. M. Jones and E. Munroe, 1935; Abyssinian Campaigns; Official story of the conquest of Italian E. Africa, 1942.

Acacia (Gr. *akis*, point). An extensive genus of spiny shrubs and trees of the leguminous family. They are natives of hot countries, and grow in belts on the extreme edge of deserts. The minute

flowers are gathered into crowded spikes or globular heads. The leaves are divided into many leaflets, which gives them a light, feathery appearance. In many

Acacia.
Australian Wattle

species the leaves are not developed, but, instead, the leaf-stalks are flattened and expanded to serve as true leaves. These *phylloides* always turn their edges upwards and downwards, so that they give little shade. Some species furnish

valuable drugs, gums, and tanning material.

The acacias of the greenhouse come from Australia, the East Indies and South America, and vary in height from 5 ft. to 20 ft. The flowers are yellow, white, and red. They flourish in any ordinary mixture of loam and sand in a temperature of from 50° to 65°. The mop-headed, standard, so-called acacia-tree of suburban gardens is really robinia, or false acacia, raised from seeds or cuttings in the ordinary way. The Australian wattle is an acacia, and this the Anzac troops planted on the graves of their comrades before evacuating Gallipoli in 1915.

Académie Française. Name of one of the most famous literary societies in Europe. It is the chief of the five Academies of which the Institute of France (*q.v.*) is composed. Its beginnings were very humble. In 1630 ten friends met in the house of a Calvinist named Valentin Conrart, to discuss artistic, literary, and scientific matters and questions of the day. In 1634 Richelieu heard of the society, and offered government patronage and authority. On Jan. 29, 1635, the society was declared an academy by royal edict, with Richelieu as its *protecteur* or patron.

By 1637 the number of members had been fixed at 40 (known as the Immortals), a limit since strictly maintained. Richelieu was succeeded in the protectorate by Chancellor Séguier, and in 1672 Louis XIV undertook the office, his example being followed by his two successors. During the revolutionary period its property was confiscated. On March 21, 1916, the Academy, which had been reconstituted in

Académie Française. M. André Maurois, wearing a silver and ivory sword of honour presented to him by French and English admirers, is seen addressing his fellow members on being elected in 1938 to this famous institution

1795 as one of the four classes (now academies) of the National Institute, was authorized to "resume its old name and regulations." Since then its history has been uneventful. The chief aim of the Academy is to safeguard the purity of the French language. Its first work was a criticism of the *Cid* of Corneille (1637). In the same year it undertook the compilation of a definitive French dictionary. This was published in 1694 and has since been under constant revision. In its eighth edition it is the stand-by of all modern French authors. The Academy remains a dominant literary influence, and its awards are coveted distinctions.

Académie Goncourt. French literary society. Founded by Edmond de Goncourt in 1896, its purpose is to foster the work of young authors. There are 10 members, chosen from the members of the Académie Française, to which de Goncourt himself belonged. An annual prize is awarded for the year's best novel.

Académie Nationale de Musique. Title by which the Opéra in Paris is officially known. Founded in 1669 by Louis XIV, this great institution has had many famous directors, including Gluck, Rameau, Rossini, Meyerbeer, Gounod, Saint-Saëns, and Massenet. It is housed in one of the most imposing buildings of its kind, dating from 1875. The Conservatoire de Musique was opened in 1784 as a training ground for the Opéra; but it has since extended its range, which now includes every kind of musical training.

Academy (Gr. *akademeia*). Originally the name of a public park and gymnasium N.W. of Athens, named after its supposed former owner, the hero Academus. In its olive groves Plato taught for nearly 50 years, and after his death it remained the haunt of Greek scholars until Justinian closed the old pagan schools in A.D. 529. Phases in the interpretation of the Platonic doctrines have been named the Old, the Middle, and the New Academies.

The term is now most exactly used in reference to any society for the disinterested pursuit of one or more of the arts and sciences. In this modern sense the earliest academy was the Museum at Alexandria founded by Ptolemy Soter during the 3rd century B.C. Here the finest scholars came from Greece and from the East, all the known arts and sciences were taught, and a great library came

into being. The Jews, and later the Arabs, took it as model for their own learned institutions. Alcuin formed a similar establishment for Charlemagne at S. Martin's, Tours, in A.D. 796. Belgium is said to have had an academy in the 12th century, and the Academy of Floral Games, founded at Toulouse in connexion with the Troubadours, has continued in existence to modern times. But it was in Italy, during the Renaissance period, that the academy, as an association of learned men, attained to fuller development. Under Cosimo de' Medici (1389-1464) was founded the Platonic Academy, the chief representative of which was Marsilius Ficinus; other academies were associated with the names of Laurentius Valla

portant include the Royal Society (1662), the Royal Institution (1799), the British Association for the advancement of science (1831), the Royal Academy of Arts, the British Academy for the promotion of historical, philosophical, and philological studies, the Royal Geographical Society (1830), the Royal Historical Society (1868), and the Society of Antiquaries (1751).

IRELAND. The Dublin Royal Society (1750); the Royal Irish Academy (1752); the Royal Hibernian Society (1803).

FRANCE. In addition to the five academies that compose the Institute of France, there are the Académie de Médecine (1820), the National Society of French Antiquaries (formerly the Celtic Academy, founded 1805), and academies in leading provincial cities.

BELGIUM. The Royal Academy of Science, Letters, and Fine Arts, Brussels (1773).

HOLLAND. The Royal Netherlands Institute of Sciences, Amsterdam (1808), and learned societies at Rotterdam, Utrecht, Haarlem, and Middelburg.

PORTUGAL. The Royal Academy of Sciences (1779).

SPAIN. The Royal Spanish Academy, founded in 1713

Academy. Plato's academy derived its name from the grove of Academus, near Athens. This mosaic is believed to represent the philosopher teaching in his shady retreat
Mosaic from Pompeii; Nat. Mus., Naples

(Academy of Naples) and Pomponius Laetus (Academy of Rome). The Accademia della Crusca set the standard of the modern written language of Italy. Another early Italian academy was the Accademia del Cimento, founded in 1657 with the object of carrying on scientific experiments.

Below is a list of the leading academy or similar institutions in different countries:

GREAT BRITAIN. The number of societies and associations devoted to various branches of learning in Great Britain, the Dominions, and the Colonies is very large. A list is given in the Year Book of Scientific and Learned Societies. The most im-

portant for the study and preservation of the Castilian language.

SCANDINAVIA. The Royal Danish Academy of Sciences, Copenhagen (1742); the Royal Society of Sciences, Trondhjem (1760); the Royal Swedish Academy of Sciences (founded, 1739, by Höpken and Linnaeus); the Academy of Uppsala for the study of Scandinavian languages (1720); the Societas Scientiarum, Helsinki (1838).

RUSSIA. The Academy of Leningrad, formerly the Imperial Academy of Sciences, founded by Catherine the Great in 1728.

ITALY. The Royal Academy of Sciences, Turin (1750), and similar academies in other principal

cities; the Accademia Ercolane, founded in 1755 to deal with antiquities discovered at Herculaneum: the Pontifical Academy, reconstituted in 1936 by Pius XI. Academies of the fine arts are at Turin, Milan, Florence, Mantua, Naples, Venice, and Palermo. The last two cities also have medical academies.

GERMANY. The Academia Naturae Curiosorum (academy of those curious about nature), founded 1662 and later known as the Academia Leopoldina; and the Prussian Academy of Sciences, Berlin (founded, 1700, by Frederick I).

HUNGARY. The Academy of Sciences, Budapest.

In Czechoslovakia, Prague has a famous academy. In Rumania, Yugoslavia, and Bulgaria there are academies and learned societies at Bukarest, Belgrade, Zagreb, and Sofia.

In the East there are at least two institutions which should be mentioned: the Union of Sciences, founded at Constantinople, now Istanbul, in 1851, and the Egyptian Institute at Alexandria (1859), which has issued various reports of considerable interest.

UNITED STATES. The first example of a modern academy was the American Philosophical Society, founded in 1743 by Benjamin Franklin, who was its president every year until his death. Other similar institutions are the American Academy of Arts and Sciences (1780); the Philadelphian Academy of Natural Science (1812), the American Academy of Political and Social Science (1886); the Washington National Academy of Sciences (1898). Perhaps the most remarkable institution of its kind is the Smithsonian Institution, founded in 1846 with money left by the Englishman James Smithson, which has been responsible for the production of numerous important works on mathematical, physical, historical, and economic subjects. See British Academy; Royal Society; Royal Academy of Arts; Académie Française; Accademia della Crusca; Smithsonian Institution.

Acadia or **ACADIE.** Name by which Nova Scotia was officially known by the French before

1713. The name was given by the early French settlers, many of whom, after the final cession of the province to the English in 1713, migrated to Canada or were exiled in circumstances which inspired Longfellow's poem *Evangeline*.

Acadia University. Baptist educational institution at Wolfville, Nova Scotia. Incorporated as a university in 1838, it is still largely denominational and has about 300 students.

Acajutla. Port of Salvador, Central America. On the Pacific, 65 m. by rly. S.W. of San Salvador, it exports coffee and sugar.

Acanthus (Gr. *akantha*, prickle). Genus of herbs with bold, handsome foliage. The large leaves proceed from the root-stock, and are cut up into numerous lobes, with their edges bearing sharp teeth or stiff spines. The irregular flowers have a single lip, and are borne in tall spikes. They are mostly natives of S. Europe, the best known being *Acanthus mollis*, with soft teeth, and *A. spinosus* (bear's breech), with stiff prickles. Both species are frequently cultivated as foliage plants. *Acanthus spinosus* is said to have furnished the Greeks with the

Acanthus. Left, leaves of *A. spinosus*, said to have been used by the Greek sculptor Callimachus (5th cent. B.C.) for the capitals of his new Corinthian column (right)

idea for the capital of the Corinthian column, an idea elaborated in Roman art and architecture more on the lines of the richer and more ornamental *Acanthus mollis*.

A Cappella. In church music, a style, either for unaccompanied voices, or with the organ merely playing the voice parts.

Acapulco. Seaport of Guerrero, Mexico. Situated 230 m. S.W. of Mexico city, it possesses the best harbour on the Pacific coast of Mexico, and is a port of call for vessels trading between San Francisco and South American ports. Mountainous country immediately inland has made communications difficult, but in 1927 the old road between Acapulco and Mexico city was reopened as a modern motor road.

The Abra de San Nicolas, an artificial opening or cut through the mts., modified the natural insalubrity of the landlocked harbour. Violent earthquakes were experienced in 1909. Exports include hides, timber, and fruit. Pop. 6,000.

Acaracu. Coast town of Ceará, Brazil. At the mouth of the river Acaracu, it is 133 m. N.W. of Fortaleza, has a small harbour, and exports maize, cotton, and salted fish. Pop. 20,000.

Acarmania. District of ancient Greece, and part of the modern Greek nome or prov. of Acarnania and Aetolia. Mountainous and thickly wooded, with an indented coastline, it is separated from Aetolia by the river Aspropotamo (white river), formerly Achelous. The Acarnanians, warlike and addicted to piracy, lent valuable aid to the Athenians in the Peloponnesian war. Under the Romans Acarnania formed part of the prov. of Achaea or of Epirus. The walls of Stratus, the old capital, are still recognizable. The area of Acarnania, with Aetolia, is 3,013 sq. m. Pop. 255,862.

Acarus (Gr. *akari*, mite). Genus of minute parasitic animals belonging to a division of the Arachnids. They include the itch and mange mites, the harvest mite which causes heat lumps in autumn, the follicle mite common in the hair, and the cheese mite.

Acarus scabiei is a species of human parasite, the female of which produces the condition known as scabies or itch. It is not visible to the naked eye, but under the microscope is seen to have a flat roundish body with eight legs, to the four anterior of which are attached suckers, and to the posterior set bristles. It burrows into the skin, where it lays its eggs, causing severe irritation, which is made worse by inflammation set up by constant scratching. The condition is readily cured by appropriate ointments. The male, which is smaller, lives on the surface of the skin and takes no part in causing the symptoms. Itch is most frequent in people of dirty habits, but may occur in cleanly people if the parasite happens to find a lodgment on the skin. *Acarus folliculorum* is a minute and unimportant parasite found in the sebaceous glands of the face and body.

Acatalectic Verse (Gr. *a*, not; *katalektikos*, stopping). In prosody, a verse which has the complete number of syllables belonging to the measure.

Accademia della Crusca. Italian learned society. The word *crusca* means chaff or bran, the idea being that the work of the academy was to separate good literary work from bad. It was founded at Florence in 1582; in 1612 the academy issued a dictionary which set the standard of the written language of Italy. The name Della Crusca was adopted in the 18th century by a school of affected sentimental English versifiers ridiculed by Byron and Gifford.

Acceleration (Lat. *accelerare*, to hasten). Word used in its most general sense to indicate any change in velocity. Hence it may mean an increase or a decrease in the speed, or a change in the direction of motion. Commonly, however, acceleration is employed to denote a change in speed only. It may be uniform, in which case equal changes of speed occur in equal times, or it may be variable. If the speed is increasing, then the acceleration is positive; if decreasing, negative. Therefore negative acceleration is what is ordinarily called retardation. Uniform acceleration is measured by the change in speed taking place in a given time when divided by that time. The formula is thus $a = (v_2 - v_1)/t$ where v_2 and v_1 are the respective velocities, a the acceleration, and t the time. Variable acceleration is measured by dividing the change in velocity occurring in an interval so small that the acceleration does not appreciably change in it, by the time. See Dynamics; Motion, Laws of.

Accent (Lat. *ad*, to; *cantus*, singing). Prominence given to the particular syllable of a word in pronunciation. There are two chief kinds of accent, pitch (musical, tone) accent, and stress (emphatic) accent. The latter predominates in modern European languages, and frequently indicates quite a different meaning or shade of meaning, as in *conduct*, *conduct*; German *umstellen*, surround, *umstellen*, transpose. On the other hand, Chinese essentially employs the pitch accent. The terms acute (rising), grave (falling), circumflex (bent round, rising and falling) are derived from the Greek system of accentuation, attributed to Aristophanes of Byzantium (200 B.C.). See Phonetics.

In music, accent is (1) a regularly recurring stress on certain notes; (2) a special stress on notes not normally accented, indicated by > , *sf*, *fz*, and other signs of emphasis.

Accentor (Lat. *ad*, to; *cantor*, singer). Name given to a subfamily of small birds, probably

related to the thrushes. They have rather soft beaks, brownish plumage, and square tails. They occur in Europe, N. Africa, and parts of Asia, and are usually found in thickets and hedges in hilly districts.

Accentor or British hedge sparrow

The group is represented in Great Britain by the familiar hedge sparrow, which is no relation of the house sparrow. Its plumage is dusky brown, with a reddish back and bluish-grey head and neck. It is often mottled with white; and pure white specimens are occasionally seen. It nests early in the spring in hedges, usually near human habitations, and frequents gardens in the winter. The eggs are blue without spots. The Alpine accentor is larger, and has a white throat spotted with black. It lives among the mountains of Europe, and occasionally visits the British Isles.

Accents. Marks used to indicate stress in pronunciation. Those now most commonly used, e.g. in French, are the old classical accents, the grave or heavy ('), the acute or sharp (') and the circumflex, a combination of both (^). In French the use of the circumflex generally indicates the dropping out of a consonant before another consonant, e.g. *bête* for *beste*, *âme* for *anme* (Latin *anima*). Although strictly speaking not accents, mention may be made of certain other marks called diacritical which serve as guides to pronunciation. The cedilla (,) is placed under c, chiefly in French and Portuguese, when the letter is to be sounded like s, not like k. In English the diaeresis (''), from Greek *diairein*, to divide, is placed over the second of two vowels to show that each vowel is to be pronounced separately, and the grave or acute accent is occasionally used in poetry over the e in *ed* to show that it has to be pronounced as a separate syllable, e.g. *learnèd*. In Spanish the tilde (~) and in Polish ' are placed over n (*ñ*, *ń*) to indicate the y-sound heard in *poniard* (*cañon*, *Poznań*). In the Teutonic and Scandinavian languages modifications in the sound of the vowels are expressed by certain marks (*Äbo*, *Götter*). Diacritical marks are used in certain Oriental languages.

Acceptance (Lat. *accipere*, to receive). In commerce, the completion of a transaction over a bill

of exchange. The person who accepts such a bill does so by putting his signature and the word "accepted" across the face of the document, although by English law the signature alone is sufficient. In English law an acceptance may be either general or qualified. A qualified acceptance varies as to time and place of payment, etc., according to the conditions stated in the bill. A bill may be accepted after it has been dishonoured. See Bill of Exchange.

Acceptilation (Lat. *acceptilatio*, reckoning a thing as received). In Roman law, complete legal discharge from all liability. In Scots law it is not necessary that an obligation should be based on valuable consideration, as in English law. In English law, before a contract or obligation is binding there must be consideration—i.e. something to be done or forborne. In Scotland the doctrine of consideration is rejected and an obligation is binding that is undertaken gratuitously and without consideration.

Access, RIGHT OF. In the British Parliament, the privilege of direct intercourse with the sovereign is still formally claimed by the Speaker as one of the "ancient and undoubted rights and privileges" of the Commons. It is a relic of the time when the King took a much more direct part in the government of the country than he does to-day. Then his refusal to hear a man, or still more to hear a petition of the Commons, might have caused serious difficulties; hence steps were taken to keep the right alive. Right of access is only enjoyed by the House of Commons collectively, i.e. through their Speaker, but peers and privy councillors have an individual right of access to the sovereign. See Commons, House of.

Accession (Lat. *ad*, to; *cedere*, to come). In Great Britain and other monarchical countries the act of acceding to the throne: to be distinguished from the coronation, which usually takes place some months later. In Britain the formality of an election has been abandoned since the time of Edward I, and a king succeeds immediately his predecessor is dead. On his accession, at a meeting of the privy council, the new sovereign takes an oath to govern according to the laws of the land and is then proclaimed.

Accession. In law, a mode of acquiring ownership in property. It is the addition by nature or labour to something already owned. The principal thing carries ownership in the things that

attach to it or grow out of it. The ownership of animals carries with it the ownership of the young. The ownership of trees and plants taking root in the ground belongs to the owner of the land, though they were planted by another. This mode of ownership applies chiefly to land gained from the sea or river. An island rising in a river belongs to the owners of the banks of the river. In foreshores, in the event of the sea receding, the new land by the doctrine of accession belongs to the owner of the adjoining land. But the ownership of property is not changed by sudden or temporary inundation. If the sea suddenly recedes, the land gained belongs to the Crown.

Accessory. Term used in criminal law to denote that while a person may not have taken a principal part in the commission of an offence, yet he has incurred some degree of criminal responsibility. Accessories are of two kinds: accessory before the fact and accessory after the fact. An accessory before the fact is one who, though absent at the time the offence was committed, yet procured, counselled, or abetted another to do it. An accessory after the fact is one who, knowing that a felony has been committed, relieves, receives, comforts, or assists the felon so that he shall escape from justice.

In treasons and misdemeanours there are no accessories. All are principals in the offence. If the party is actually or constructively present at the commission of the offence, he aids and abets and must be so charged. Concealment of the fact that another intends to commit a felony will not amount to crime, nor will a passive acquiescence or words that amount to bare permission be sufficient. An accessory is liable for all results from his unlawful command. If he orders A to assault B and A kills B, he is accessory to murder.

Accidence (Lat. *accidere*, to happen). That part of grammar which treats of the accidents (inflections) of words, or the changes of form in nouns and verbs which indicate a difference of relation to someone or something else. While some languages, e.g. Greek and Latin, are rich in inflections, English has preserved only few traces of them.

Accident. In English law there is no definition of an accident. Apart from the Workmen's Compensation Act of 1925 the word is generally used in actions for negligence, where the defendant can

succeed if he proves that the injury was caused by inevitable accident; that is, by something which was neither his fault nor the plaintiff's, but a state of things no reasonable man could foresee or avoid. In connexion with Workmen's Compensation claims the decisions remained very unsatisfactory until 1903, when the case of *Fenton v. Thorley & Co.* was decided. The Court of Appeal had held that accident involved the idea of something fortuitous and unexpected, and therefore something like a fall or blow that was unexpected was essential to constitute an accident. If a man took a risk, and the chance went against him, and he was hurt, it was no accident; nor was it an accident if he were injured by the wilful or negligent act of another.

In the House of Lords this decision of the Court of Appeal was reversed, and Lord Macnaghten in his judgement defined what it is that constitutes the essentials of an accident. "The expression is used in the popular and ordinary sense of the word as denoting an unlooked-for mishap or untoward event which is not expected or designed." Thus, if one is run over in the street by a car, it is an accident (as it would be in popular language), although the driver drove negligently, or even ran one down on purpose. In *Nesbet v. Rayne and Burn*, 1910, it was held that the death of a workman who was intentionally shot with a view to robbery was caused by an accident. It is now settled that injury by accident means any injury not expected or designed by the workman, whether it was brought about by the wrongful act of another person, or not. Disease may, therefore, be an injury by accident.

The National Insurance (Industrial Injuries) Act, 1946, removed the whole question of workmen's compensation from the courts, and transferred it to the ministry of National Insurance.

Accident. In logic, a non-essential quality of a person or thing. Ink, whether black or red, is still ink; a man, virtuous or vicious, is a man. Blackness, redness, virtue, vice, are accidents.

Accidental. In music, a sign for temporarily raising or lowering a note, and altering the pitch by sharp, flat, or natural.

Accidents. These may be divided into general and industrial. The former are due largely to vehicular traffic. Road accidents in Great Britain in-

creased steadily to a peak figure in 1941 of 9,169 killed; then a decline occurred and in 1943 there were 122,536 casualties of which 5,796 were fatal. As wartime black-out rules probably affected totals for the worse, and the disappearance of many cars from the road for the better, the figures for the last full year of peace, 1938, are more representative: 233,359 casualties, of which 6,648 were fatal. In 1943 there were 768 persons killed and 2,983 seriously injured on the railways. Responsibility for reducing accidents as far as possible rests on the Ministry of Transport and the police. The Minister holds inquiries into all considerable accidents caused by public vehicles, and in the years before the Second Great War promoted measures to make road travel safer: speed limits, multiple tracks, pedestrian crossings, traffic lights, roundabouts. Drivers of cars are compulsorily insured against third-party risk. If negligence on the part of a company or corporation or individual can be proved, sufferers can obtain compensation. Insurance against railway accidents is obtainable for a few shillings on a journey, as well as by policies from insurance companies.

Industrial accidents are those which happen in the course of one's occupation. In the United Kingdom in 1938 they numbered 442,787, of which 2,492 were fatal. The largest group were mining accidents (983 killed, 162,097 injured), followed by those in factories (735 killed, 219,907 injured). Reportable accidents in factories had risen by 1942 to 314,630, of which 1,363 were fatal. The duty of reducing their number as far as possible rests on the Ministry of Labour, which acts through a staff of inspectors. Details of accidents having been reported, consideration of them may lead to preventive legislation. Law and invention have both contributed to the greater safety of industrial workers. Persons injured at employment have hitherto been provided for by the Workmen's Compensation Act, 1925, the Supplementary Allowances Act, 1940, and the Temporary Increases Act, 1943. After a fatal accident a dependent survivor with children could receive a maximum of £700; the victim of a non-fatal accident could receive 40s. weekly, or 50s. after 13 weeks, with 5s. extra for each child under 15 years. According to the Government measure of

1946, Workmen's Compensation is regarded not as part of employers' liability but as a social service. Benefits are paid by the state according to the degree of disablement, the period of incapacity, and the number of dependents. Insurance policies against industrial accidents are obtainable from the chief companies. Much scientific research has been undertaken into the physical and psychological factors tending towards individual "accident-proneness." The first international conference for the prevention of industrial accidents was held at Milan in 1912.

Acclamation (Lat. *ad*, to; *clamare*, to shout). Shout of approval by a public assembly of any kind. Acclamations were prominent features in the public life of Rome. They were given to actors and authors, were raised at weddings, and even at funerals, while occasionally preachers received them. Emperors and victorious generals were acclaimed on great occasions. At first an acclamation might be favourable or unfavourable; gradually the word became restricted to the former sense.

Acclimatisation (Fr. *à*, to; *climat*, climate). Term for the adaptation of people, animals, plants, or trees to a new environment, particularly with reference to climate. Applied to an individual or a race, it has special significance with reference to disease. In the case of an individual it means that a person has acquired the power of absolutely or partially resisting agencies which otherwise would be injurious to his existence. This power may result from recovery from a particular infectious disease. It may also mean that as the result of subtle change in his whole body he has gradually adapted himself to the general conditions of life in a new environment.

Applied to an entire race, acclimatisation is a form of protective evolution, and implies that the race has acquired an increased power of resisting infectious diseases, or else has acquired a greater capacity for recovering from them. The greater acclimatisation of a race to new surroundings or new agencies is a question of evolution, principally by means of the factor of the survival of the fittest. Both individuals and races must undergo acclimatisation in new environments if they are to survive. Thus, a person born in Great Britain is apt to find the climate of the West Coast of Africa unhealthy, and he must become used to it, that is,

acclimatised, either by gradual absorption of protecting toxins into his system, or by recovery from the disease peculiar to the country. In the same way, the West African negro requires to be acclimatised to the climate of Great Britain. In the absence of such a protecting process survival is impossible where the agencies are at all deadly. All races which have dwelt long in one environment exhibit great resisting power to its dangers.

In animals and plants acclimatisation depends in general on two factors, food and enemies. Some races of animals, including types of the horse, have survived because they have been able to accommodate their digestive apparatus to the food found in their

killed by unsuitable temperatures. The rabbit, the fox, the sparrow, thrushes and starlings, and even English earthworms, introduced into Australia, found plenty of food there and an absence of their natural enemies, and have acclimatised themselves so completely as to evict native species by beating them in the competition for sustenance. In general birds acclimatise themselves better than mammals.

In the acclimatisation of plants somewhat similar considerations apply, though plants, having no temperature of their own, are more susceptible to environment. But the prickly pear, a solitary specimen of which was introduced into Australia, has acclimatised itself so thoroughly, in the absence of its plant enemies, that it spreads over millions of acres. The English briar rose is spreading nearly as fast. The lantana, known as the "curse of Mauritius," is a weed that has prospered with disastrous results in Africa, Australia, Asia, and America. On the other hand, such climatically indigenous plants as rice, cotton, tea, tapioca, cannot be acclimatised beyond distinct geographical limits; but probably a great number of plants, of which the eucalyptus is a typical example, accommodate themselves to the climatic variations by selection and adaptation of their own characteristics.

Accolade (Lat. *ad*, to; *collum*, neck). Act of conferring knighthood by gently striking on the shoulder with a naked sword. It is performed either by a sovereign prince or by a knight holding authority from such a prince.

Accollé. Heraldic term for two shields placed side by side and touching each other. One bears the husband's arms and the other those of his wife, or one bears paternal arms and the other insignia of office.

Accommodation. Term in English law, generally applied to a bill of exchange or promissory note which is executed by the parties thereto, so as to enable one or all of them to discount it, and so raise money. It is colloquially called flying a kite. A bill of exchange drawn by A upon B and accepted by B ought to mean that B owes A money, and the bill is a document whereby B pledges himself to pay that money. But in the case of an accommodation bill, A draws a bill for (say) £100 on B; B writes across it "accepted," and signs it. A then takes the document to a bill discounter, or a bank, and, on the strength of B's acknowledgment of indebtedness and promise to pay, discounts

Accolade. King George VI giving the accolade to Gen. Sir Oliver Leese

environment. Other animals are presumed to have died out because the food they could find was unsuitable or because they were starved out in the struggle for food by competing races. Among the ranks of enemies the most potent appear to be parasites and micro-organisms, which, by causing diseases, may sweep a species out of a country or even a continent. It is supposed that the disappearance of the primitive horse from North America was thus brought about in the carboniferous period. Other factors are climatic temperature and habit. The yak cannot be acclimatised away from its mountains; reptiles, especially snakes, are extremely susceptible to low temperatures; and many insects, including the malarial mosquito and the plague flea, are

the bill for ready money—generally the full £100 less 5 per cent. or thereabouts. When the bill becomes due the holder can claim the £100 against B or A. It is a device to raise money by pledging one's credit. As between A and B, if B pays the £100 to the holder, and A has had the money for the discount, A must indemnify B. The word accommodation is also used in a wider sense, meaning to lend money generally, for instance the accommodation afforded by a banker to a customer.

Accommodation (Lat. *accommodare*, to fit to). Term used in theology and Biblical exegesis. It means that a statement of truth is modified to make it better understood. Some of the parables of Christ and many utterances of the prophets afford instances.

Accommodation. As applied to vision, the process or the power of focusing the eyes to enable objects to be seen at different distances. The adjustment is effected by alterations in the convexity of the crystalline lens behind the pupil, through which rays of light pass to the retina. *See* Eye.

Accompaniment. Music of a subordinate nature played or sung to enrich and support solo voices or instruments. When an accompaniment ceases to be subordinate to the solo part or parts, the music should be described as a duet, trio, quartet, etc. *See* Obbligato.

Accomplice (Lat. *ad*, to; *cum*, with; *plicare*, to weave). One who assists another in the commission of a crime. An accomplice may be an aider and abettor or an accessory. The evidence of accomplices is always admissible against a prisoner, but the judge should advise the jury that it is dangerous to convict on such evidence if not corroborated. The evidence of other accomplices is not corroboration, and evidence offered as corroboration need not prove that the prisoner committed the crime. It is enough if it connects him with it circumstantially. The older form of the word is complice. *See* Accessory.

Accord and Satisfaction. Term used in English law. Where a cause of action exists, and the parties agree that something shall be paid, or given, or done, in satisfaction thereof, and that something is paid, given, or done, the original cause of action has gone, because there is accord and satisfaction. Thus, if X owes Y £100, and Y agrees to accept X's car in lieu thereof, there is accord ;

and if the car is handed over by X there is accord and satisfaction, and the £100 is no longer due. There can be no accord and satisfaction of a larger sum by payment of a smaller one. Thus, if A owes B £100, and B agrees to accept £50, B can still sue for the other £50. But if the £100 is due on a day, and B agrees to accept, and is paid, £50 the day before, then there is accord and satisfaction.

Accordion (late Lat. *accordare*, to agree). Portable reed instrument with bellows and button keys. To save weight and space, each key usually sounds two notes with the alternating action of the bellows. A Viennese invention, it dates from 1829. The piano-acordion, with keyboard in place of buttons, was introduced in Paris, 1852, and became highly popular in many countries from about 1920.

Accosted (Lat. *ad*, to; *costa*, side). In heraldry, a charge or device when placed between two others : or two animated creatures placed side by side.

Account (Lat. *ad*, to; *computare*, to reckon). In English law a settled account is a statement of accounts between two parties which is agreed to and accepted by both as correct. An action by the creditor will lie on this on "an account stated." An action for an account may be brought by anyone who alleges that another owes him money on dealings between them which have resulted in indebtedness by the defendant to the plaintiff; and in such an action the defendant will, on a *prima facie* case being made out, be compelled to disclose all dealings. For example, if A has agreed to pay a commission to B on all orders given by customers introduced by B to A, B can bring an action for an account of the orders given and their amount. Such actions are almost invariably tried by an official referee, or by a master in chambers.

Accountancy. The keeping, directing, and examining of accounts, as practised by professional accountants. The first traces of the professional keeping of accounts are to be found in Italy. The very complete fabric of state accounting constructed by the Romans was, after the Roman Empire, eventually revived by the communes and free cities therein. Records of the 12th century are known, but it was not until 1581 that the first association of accountants was founded—in Venice. Within 100 years this had

become so important that only its members could act in that state as accountants in connexion with law or public administration.

A college was established in Milan in 1739, approved by the Senate in 1741, and opened in 1745, and a statute of 1744 decided that to obtain membership the candidate should have a knowledge of Latin, commerce, public affairs, economics, and arithmetic, serve a five years' apprenticeship, pass an examination in the science of accounting, and be 25 years of age. Finally, after repeated requests, the state of Milan agreed to appoint to public offices only accountants whose acquirements could be attested by the college. Later in the century the college was dissolved.

The profession encountered many vicissitudes, but in 1879 a congress held at Rome recommended the formation of associations or colleges of accountants in each province of Italy. This was carried out, some of the colleges growing out of earlier societies in certain towns. By royal decrees in 1885 and 1891 the sphere of accountants in Italy was defined, and latterly the northern half of that country, where the great commercial centres are situated, has been a fertile field for the exercise of the profession.

In the United Kingdom

The initial growth of the profession in the United Kingdom is undoubtedly first traceable in Scotland. In 1773 seven accountants were mentioned in the Directory of Edinburgh as practising in that town, and in 1783 the Directory of Glasgow mentioned six accountants. In 1853 steps were taken in Edinburgh to form a closed body. The Institute of Accountants resulted, and this obtained a royal charter in 1854. A similar royal charter was obtained by the Glasgow Institute of Accountants in 1855, and later Aberdeen followed suit. The three bodies began in 1896 the issue of a directory of Scottish chartered accountants. Admission to any of these societies can be obtained only after service under articles, after passing three examinations and attendance at certain university classes.

The first records of practising accountants in England appear about the same time as those in Scotland, as five names are reported in the British Universal Directory of 1790, but it was not until 1870 that steps were taken

to organize the profession. Then a society was formed at Liverpool, soon followed by the Institute of Accountants in London, and in 1871 by a society at Manchester. The Society of Accountants in England was formed in 1873, and in 1880 the existing societies were incorporated by royal charter into the Institute of Chartered Accountants of England and Wales.

In 1885 the Society of Incorporated Accountants and Auditors was formed, and in 1891 the Corporation of Accountants in Glasgow. The latter body, with the Institution of Certified Public Accountants (1903) and the London Association of Certified Accountants (1905), now constitutes the Association of Certified and Corporate Accountants. In Ireland a Chartered Institute was formed in 1888, and a Society of Accountants and Auditors in 1900. Other organizations in the U.K. include the Institute of Company Accountants, the Institute of Cost and Works Accountants, the Institute of Municipal Treasurers and Accountants, and the Association of International Accountants. The movement towards organization, initiated in the British Isles, has since spread throughout the British overseas dominions.

The profession does not seem to have developed in the U.S.A. until much later. Its work there is mostly confined to audits and investigations, and differs from that of the United Kingdom in that its members may advertise freely.

New Openings

Accountants have become more numerous of recent years, but the demand has fully kept up with the supply. The Companies and Bankruptcy Acts have provided profitable openings for accountants as liquidators and trustees. Large firms and companies resort more and more to qualified accountants as the heads of their accounts branches. Manufacturers look to them for their costing, etc. The income tax laws require expert knowledge, and with the high rate of tax now in force numbers of people are calling in skilled accountants. This is an age of specialization, and the "figure-specialist," if he can be so called, is a natural outcome of this tendency, and is supplying a demand that is unlikely ever to cease through excessive supply.

Accountants' charges vary. It is usual to agree a sum for, say, an audit, and not to pay directly according to the time employed.

For trustee and liquidation work there is a scale percentage of remuneration.

To become a member of the Institute of Chartered Accountants in England and Wales the beginner must first pass the preliminary examination, or be exempted from it on the ground of holding a certificate of equal standard. Provided he is sixteen years of age, he must then enter into articles of clerkship for five years with a member of the institute in practice in England or Wales. For university graduates the period is only three years. After the expiry of one-half of the term of service the articulated clerk can sit for the intermediate examination, which is held in the following subjects: (1) book-keeping and accounts, including limited companies, partnership, and executorship; (2) auditing; (3) general commercial knowledge. After a further two years he can present himself for the final examination, conducted in the following subjects: (1) and (2) as in the intermediate examination, but on a higher standard; (3) general financial knowledge; (4) company law; (5) law relative to bankruptcy, deeds of arrangement, etc.; (6) mercantile law and law of arbitration and awards. Membership of the institute is divided into two classes, fellows and associates (F.C.A. and A.C.A.).

A person may also become entitled to the designation of Chartered Accountant by acquiring membership of one of the Scottish chartered bodies or of the Institute of Chartered Accountants in Ireland. The necessary preliminaries are much the same.

Incorporated Accountants

To become a member of the Society of Incorporated Accountants and Auditors, a preliminary (or educational) examination or one of similar standard must first be passed; then articles of five years' service must be entered into, except in certain cases referred to below. At the expiry of two years the articulated clerk can take the intermediate examination, and in his last year the final examination. The subjects of both examinations are similar to those of the Chartered Institute.

Service under articles is not insisted upon in the case of accountant's clerks with nine years' continuous service. They must first pass or obtain exemption from the preliminary examination. They may be allowed to sit for

the intermediate after six years' experience, if not less than 22 years of age, and then for the final after nine years' experience, if not less than 25 years of age. This is a valuable concession, and has been much appreciated by those qualified; it has also been the means of securing many able and highly-skilled accountants.

Fellows are entitled to the letters F.S.A.A. after their names, and associates A.S.A.A. The professional designation is Incorporated Accountant. An associate may be elected to fellowship after completing three years in public practice.

Service under articles is not insisted upon by the Association of Certified and Corporate Accountants. The Association holds three examinations, viz., preliminary, intermediate, and final. Exemption from the preliminary examination may be obtained by those who have secured matriculation or school certificate, or have passed other examinations of equivalent standard. The examinations are similar in subject and scope to those of the other two bodies. The passing of these examinations does not of itself qualify for membership of the Association; a minimum of five years' sound practical accountancy experience is required in addition. The designation of members is Certified Accountant. There are two classes of members, fellows (F.L.A.A.) and associates (A.L.A.A.).

See Bankruptcy; Book-keeping; Company Law.

ACCRA or **AKKRA**. Seaport and, since 1876, capital of British Gold Coast Colony, 80 m. E. of Cape Coast. It has rly. communication with Takoradi harbour, the line running 365 m. via Kumasi, in Ashanti. A municipality, Accra is an air, telegraph, and wireless station, and has a lighthouse, banks, Anglican church, and race-course. Achimota College (1927) is the principal educational institution of the Gold Coast. There is no harbour, and landing is by surf-boats. It exports cocoa, gold dust, palm oil, ivory, rubber, gum, and timber. Pop. 72,977.

ACCRETION (Lat. *ad*, to; *crecere*, to grow). In general, a term meaning growth or formation by external additions. It is used in medicine, geology, etc.; in law, where land is formed gradually and imperceptibly by the action of water it belongs, or accrues, to the owner of the adjacent soil.

Accrington. Municipal and parl. borough and market town of Lancashire, England. On the river

Accrington arms

Hindburn, 23 m. N.W. of Manchester by railway, it is an important cotton-spinning centre, with cotton-weaving, bleaching, cotton-printing, and dye-works, and manufactures chemicals and textile machinery; also carpet sweepers, mangles, and washing machines. There are quarries and collieries in and near the town. S. James's Church, rebuilt in 1763, dates from 1554, but the police station, fire station, law courts, and other buildings are modern. First mentioned in Henry II's reign, Accrington developed with the railway and the Lancashire coalfield in the middle years of the 19th century, and was granted a charter of incorporation

in 1878. Formerly giving its name to a county division, it was created a parl. borough under the Representation Act, 1918, and now returns one member to Parliament. Market days, Tues., Fri., Sat. Pop. about 40,000.

Accumulation (Lat. *ad*, to; *cum*ulare, to heap up). Term used in English law. By the Thellusson Act (1800) restrictions were placed on the accumulation of the income of property in the hands of trustees. A testator or settlor can direct the accumulation of the income of property only for one of the following periods: (1) the life of the settlor; (2) 21 years after his death; (3) the minority of any person or persons living at the settlor's death; or (4) the minority of any person who, if of full age, would be entitled to the income. Any excess over these periods is, with a few exceptions, void. The Thellusson Act is so called because it was a consequence of the will of Peter Thellusson (*q.v.*).

ACCUMULATOR: ITS VARIETIES & USES

P. J. Risdon, Consulting Engineer

Below are described the various types of accumulators. Related information should be sought in articles such as Battery; Cell; Electricity; Hydraulics; Motor-car; and Water Power

An accumulator is a device by means of which energy can be stored for future use. Accumulators are of various types, which differ according to the method in which the power to be stored is generated and applied. For example, a watch-spring may be said to constitute an accumulator in that, when wound up, it conserves and imparts power for operating mechanism, but the term is usually applied to devices for the storage of power in other forms. In engineering, the principal types of accumulator for the storage of energy on a large scale are hydraulic, steam, pneumatic, and electric.

HYDRAULIC ACCUMULATOR. Water being for all practical purposes inelastic, it follows that pressure imparted to it must be maintained without fluctuation, if the water is used for driving hydraulic machinery. To secure a constant pressure of 1,000 lb. per sq. in. requires a natural head of water of more than 2,200 ft. As this is unobtainable, an artificial head of water, giving any desired pressure, is created by the hydraulic accumulator, invented by Sir W. G. Armstrong. Of the several varieties of this, the ordinary weight type (Fig. 1) consists of a long vertical cylinder in which a ram works up and down. The ram is heavily loaded with weights which always tend to force

it downwards. Piping connected to the cylinder is laid to the various hydraulic machines to be served. To charge the accumulator, water is pumped into the cylinder at the lower end, lifting the loaded ram to the top of its stroke, when, the cylinder being full, the water supply is automatically cut off. The pressure in lb. per sq. in. exerted by the ram upon the column of water is W/A where W is the weight of ram plus its load in lb., and A is the cross-sectional area of the ram in sq. ins. By varying the weights on the ram, pressure on the water may be increased or diminished.

When, by starting any hydraulic machine, water is drawn from the cylinder, the ram descending maintains a uniform pressure on the water. As soon as water is drawn off, the pumps again come automatically into action and maintain the necessary supply in the cylinder. By this means the pumps, which could not directly maintain a constant pressure supply to meet the fluctuating demands of the machines, are enabled to perform their duty satisfactorily. Working pressures obtained in this manner usually range from 700 lb. to 1,500 lb. per sq. in., although much greater pressures can be obtained. With this type of accumulator the only auxiliary power required is for the water pumps, which can be driven by any power available and sufficient.

The main principle of the differential accumulator (Fig. 2) is the same, but in this case a second and larger cylinder is superimposed on the first, and the top end of the ram is fitted with a larger piston working in this upper cylinder. A third and larger cylinder and a fourth still larger may be added. By the necessary arrangement of valves and piping any one of these pistons may be used, thus giving a choice of working pressures.

The invention of the hydraulic accumulator by Sir Wm. Armstrong opened a great field for the use of water as a medium for the transmission of energy for operating machinery. Under the pressure imparted by an hydraulic accumulator water may be regarded in the light of a flexible piston rod, for, being almost as incompressible, it instantly communicates pressure imparted at one end throughout the length of a pipe.

In shipbuilding and armament works it enables pressures of many thousands of tons to be obtained

Accrington. Town hall, built 1857. The market hall (right), opened 1869, has groups over entrance representing Commerce, Industry, and Agriculture

from a single hydraulic press. On slipways hydraulic rams haul vessels of 5,000 tons each up the incline. In spite of the increasing use of electricity, which in many cases has superseded water power, the hydraulic accumulator is still almost indispensable for heavy work where, as in forging presses, great pressures are required.

STEAM ACCUMULATOR (Fig. 3). Modified form of hydraulic accumulator in which steam pressure is substituted for the load upon the ram. A steam cylinder is fixed above the hydraulic cylinder, in which works a piston, secured to the upper end of the ram. Steam, admitted to this upper cylinder, which is of much larger diameter than the hydraulic cylinder, acting upon the larger piston area, exerts a constant pressure upon the ram. By proportioning the areas of the steam piston and the ram, a comparatively low steam pressure can be made to exert a far greater pressure per sq. in. on the ram.

The advantages of this type are that, by varying the steam pressure, any desired pressure, within the limits of the machine, may be obtained, and that steam, while maintaining a steady pressure, provides a cushioning effect as compared with a dead weight. It necessitates the use of a boiler for generating the steam required.

PNEUMATIC ACCUMULATOR. This is a modified form of hydraulic accumulator. It is similar in action to the steam accumulator, but

compressed air is employed in the upper cylinder in lieu of steam, the advantages being common to both. In this type an air compressor is an essential adjunct. Another form of pneumatic accumulator is known as a compressed air-receiver.

ELECTRIC ACCUMULATOR. This is a secondary cell, storage cell, or "reversible cell," in which electrical energy, passed into the cell as an electric current, is converted into electro-chemical energy and remains inactive until reconverted into an electric current by the discharge of the cell, which takes place when the terminals of the positive and negative electrodes are connected outside the cell. An assemblage of such cells is termed a battery. A secondary cell, when charged, resembles a primary cell in that it is capable of generating

Fig. 3. Steam Accumulator

Fig. 2. Differential Accumulator

current, but with the difference that, when exhausted, it can be recharged again and again by passing an electric current through it in the opposite direction.

DESCRIPTION OF CELL. The first satisfactory secondary cell was invented by Planté in 1860, and the principle of this applies to the cell of to-day. It is a lead-sulphuric-acid cell, and consists of a jar or case containing a solution of sulphuric acid and water called the electrolyte; in this two or more lead plates are immersed, known as the electrodes, or as the positive and negative plates, or anode and cathode. The capacity of the cell depends upon the superficial area of plate exposed to the solution: consequently the greater the capacity required the larger the cell and the greater the number of plates employed, the positive and negative plates being arranged alternately.

PREPARATION OF PLATES. Before use the lead plates have to be

formed or prepared. The Planté process was a tedious one, and involved immersing the plates in dilute sulphuric acid and repeatedly passing an electric current through them, first in one direction and then in the opposite, until, as the result of electro-chemical action, the positive plate became coated with peroxide of lead and the negative plate was reduced to a spongy condition of pure lead. This process was simplified in 1880 by Faure, who, by coating the plates with red lead, obtained the desired result much more rapidly. Another difficulty was that a permanent coating of lead sulphate was gradually deposited on flat plates. This led to the substitution of lead grids, into numerous interstices of which a paste, consisting of sulphuric acid and Pb_3O_4 (red lead) for positive plates and PbO (litharge) for negative ones, is firmly pressed, and which is rapidly reduced by the current to peroxide of lead on the positive, and to a soft porous mass of lead on the negative plate, presenting a greatly increased effective surface in contact with the electrolyte, for a given size and weight of plate. This is known as the E.P.S. cell.

CHEMICAL ACTION. This is of a complex nature, but may be explained as follows. Supposing the cell to be fully charged; during discharge, by the electrolytic action of the current, oxygen is freed and conveyed to the negative plate, the surface of which, attacked by the acid, tends to become converted into sulphate of lead, while hydrogen deposited on the positive plate is oxidised by the peroxide and the resultant oxide, attacked by the acid,

Fig. 1. Hydraulic Accumulator

tends to produce sulphate of lead on the positive plate also, a portion of the acid in the solution being abstracted in the process. When the cell is almost discharged, the temporary loss of acid in the solution will have reduced the specific gravity of the latter to 1.18. This may be checked by means of an hydrometer, and forms a valuable means of ascertaining the condition of a cell. When the battery is recharged, the chemical process is reversed. Hydrogen is deposited at the negative plate, converting it again into pure lead; the positive plate is converted by oxygen into peroxide of lead again, while the sulphuric acid originally abstracted in the formation of the lead sulphate is freed and returned to the solution, raising its specific gravity to 1.2 again when the cell is fully charged.

ELECTROMOTIVE FORCE, E.M.F. This for a single cell averages two volts, commencing, with cell fully charged, at 2.2v. and falling finally to 1.8v. when the cell is nearly discharged. If discharge be continued beyond this point, the plates become permanently sulphated and the efficiency of the cell seriously impaired. The energy efficiency in watt hours under favourable conditions may amount to 70 p.c., but, under unskilful supervision, it may be anything less.

CAPACITY. Capacity is measured in ampere hours, and depends upon requirements, from the small two-cell four-volt accumulator up to large station batteries. The capacity, size, number, and arrangement of individual cells are proportioned to the number of ampere hours and voltage required. Cells may be connected either in series or in parallel. To connect them in series the positive terminal of one cell is connected to the negative of the next, and so on according to the voltage required. Each cell, irrespective of size, gives two volts; variation in size simply affects the number of ampere hours output. Thus the output of 24 cells of 20 ampere hours each in series will be 20 ampere hours at 48 volts. However many cells are connected in series only, the output in ampere hours will be that of one cell. Only cells of the same capacity should be coupled together. To connect cells in parallel all the positive terminals are joined together and all the negatives together; by this means the ampere hours output is increased while the voltage remains at two. Thus if one cell has a capacity of say 20 ampere hours, 24 cells in parallel would give 480 ampere hours but only

at 2 volts. But if the 24 cells be arranged in two parallel rows, each having 12 cells in series, we should get 40 ampere hours at 24 volts.

In station installations a few additional cells are included to overcome circuit resistance, etc., which causes a drop in the voltage. Thus, if a current of 50 volts is to be provided, the number of cells required in series will be not 50/2 but 50/1.85 or 27 cells.

Station cell cases (Fig. 4) are of glass, or lead or lead-lined boxes are employed. Small portable accumulator cases (Fig. 5) are made of celluloid or othersuitable material for lightness.

CHARGING. When an accumulator is charged for the first time, the acid solution must not be placed in the cell until the charging current is ready to switch on. In mixing the solution acid must be added slowly to water—not water to acid—in the proportion of one part (by measurement) of sulphuric acid and five parts of distilled water. When cold, test the specific gravity, which should be 1.19. The rate of charging (direct current) should

Fig. 5. Radio-type portable cell

not exceed the accumulator rating. The voltage should not be less than the number of cells in series multiplied by 2.75. When fully charged, the specific gravity rises to nearly 1.21, the solution has a milky appearance, and the positive plates are a dark chocolate colour.

Other types of cell include that invented by Edison, who used iron and nickel peroxide in a solution of caustic potash. The mean E.M.F. of this cell is about 1.1 volts. Advantages claimed are great strength and capacity per pound of its own weight; rapid charging and discharging; and that it does not deteriorate if left uncharged.

Fig. 4. Country House Accumulator

A special form of alkaline cell is the Drumm accumulator, which is fitted with pencil-type positive plates and negative plates in the form of sheets of gauze, on which metal zinc is electrolytically deposited. A cell of this type is capable of high rates of discharge and can be charged at fairly high rates; generally its characteristics make it suitable for electric trains and it was used on the old Great Southern Railway of Ireland on trains from Dublin.

The nickel-cadmium cell employs nickel hydroxide and graphite as the active positive material and negative plates containing a mixture of cadmium and iron. Discharge characteristics are like those of the Edison nickel-iron cell.

CARE OF ACCUMULATORS. The efficiency and life of lead accumulators depend upon careful maintenance. A cell which might last 8 years may be rendered useless in as many months by mishandling or neglect. (1) The amperage of the charging current should not exceed that for which the accumulator is rated, or the plates become buckled and portions of the active materials fall out as the result of too rapid freeing of the gases. (2) Discharge must not proceed more rapidly than the rated capacity or beyond the point where the voltage drops to 1.85. (3) Accumulators should never be allowed to remain in a discharged condition, otherwise permanent sulphating of the plates occurs. They should not be allowed to remain unused, even when charged, for very long periods. It is better occasionally to discharge and recharge them. (4) The specific gravity of the solution should be occasionally checked and evaporation made good with distilled water only. Too high a specific gravity results in the acid unduly attacking the lead, while

Accumulator. Fig. 6. Plates, lead grids filled with paste (red lead for positive, left, and litharge for negative, right), from small accumulator Hart Accumulator Co. Ltd.

too low a specific gravity reduces efficiency. (5) In replenishing solution only brimstone sulphuric acid and distilled water should be used. (6) Individual cells, as well as the battery, should be tested once a week for voltage and, if incorrect, should at once be examined for short circuit or other defect. (7) Terminals should be kept clean and free from corrosion. (8) If a cell or battery is not required for use for a considerable time it should first be fully charged, all the solution taken out, the terminals cleaned and greased, and in this condition it should be stored in a dry place or carefully packed for carriage. The exterior of cases should be kept clear of all moisture and dirt. Purity of materials and cleanliness are important. These precautions apply to all lead-sulphuric-acid accumulators.

The applications of electric accumulators are numerous. At power stations and hospitals they form a valuable stand-by in case of emergency, such as a temporary failure of the supply. In country-house and similar installations a battery is a necessity, since without it the plant would have to be run whenever a light was required. Small portable accumulators are used for radio sets.

Bibliography. H. G. Brown, *Lead Storage Battery*, 1938; W. S. Ibbotson, *Accumulator Maintenance and Repair*, 1942; G. W. Vinal, *Storage Batteries*, 1940.

Accusation. Term used in English law. It is a crime to accuse or threaten to accuse; or to send to any person any letter or writing with intent to extort money or gain, accusing or threatening to accuse either that person or another of a crime, or of any misconduct not amounting to a crime. For example, when a man wrote a letter to M. demanding 10s. and adding "if I do not get it I shall let Mrs. M. know of your doings with Kate —" the sender of the letter was held guilty of demanding money with menaces. In England this is popularly known as blackmail.

Accusative. Grammatical term. It is the name of an original Indo-European case, denoting the immediate object of a transitive verb and answering the question whom? what? It is supposed to be the case used in naming an accused person. The Greeks called it the causing case (*aitiatiikē*), as giving the "cause" of the action of the verb. In English it is commonly called the objective case.

Ace (Lat. *as*, a unit). Term originally used in connexion with dice, to denote the side of the die with one pip. Hence, the expression, when dicing with two cubes, *deuce ace*, i.e. *deuce* turned up with one die and *ace* with the other. The *ace* is also the one pip in playing cards; but though in dice always indicating the lowest, in cards the *ace* is often the highest of each suit. The term denotes one point at badminton, rackets, tennis, etc.

Ace. Term first used in the First Great War to designate a fighting pilot who had brought down five enemy machines in aerial combat. In France and Germany particularly the scores of the *aces* were followed with great interest. The term was used again in the Second Great War, the U.S. Army Air Force adopting a system whereby a pilot who shot down five enemy machines was an *ace*, and one who shot down ten or more became a *double ace*. British pilots in both wars discouraged the *ace* system.

Aceladama. Name meaning in Aramaic, field or place of blood. The modern Hak ed-Damm, it is a spot S. of Jerusalem identified with the potter's field of Zech. 11 and Matt. 27, and the Aceladama of Acts 1, which Judas bought or the chief priests acquired as a burial-place for strangers. During the Crusades pilgrims were buried here.

Aceraceae (Lat. *acer*, maple). Large family of trees and shrubs whose watery sap in some species yields sugar.

The leaves are lobed, or divided into two rows of leaflets. The flowers are sometimes without petals, massed in corymbs or racemes, the two-lobed carpels developing into the double keys or samaras familiar in the sycamore. They are natives of most temperate countries. The timber though light is useful, and from the bark brown and yellow dyes have been obtained. *See* Maple.

Acetate. The salts of acetic acid, the oldest salts made artificially. They include verdigris (copper acetate), made by the Greeks from grape skins in contact with copper; sugar of lead (lead acetate), a poisonous salt with a sweetish taste; and iron and aluminium acetates used in dyeing.

Cellulose acetate is mostly manufactured by treating cotton fibres (linters) with acetic acid and acetic anhydride in the presence of sulphuric acid as a catalyst. It is the basis of many plastics, films, lacquers (dopes), and rayon (artificial silk). Combined with a plasticizing agent it gives non-inflammable, sub-standard (16 mm. or 9 mm.) cinema safety film which can be used without the special licence required for the inflammable nitrate film. *See* Cellulose; Film; Plastics.

Acetic Acid. Acid ($C_2H_4O_2$) which occurs naturally in the juices of many plants, either in the free state or combined with potassium or calcium. Vinegar contains $\frac{1}{4}$ to 6 per cent of acetic acid and is formed by the action of a ferment, *Mycoderma aceti*, on a weak alcoholic liquor. Vinegar was the only acid known to the ancients.

The acid is largely made by the destructive distillation of wood, the impure acetic acid thus obtained being known as pyroligneous acid. This acid is purified from tarry matters by neutralizing with lime and decomposing the acetate of lime thus formed by sulphuric acid. It is also extracted from pyroligneous acid by solution in ether, later evaporated, leaving the acetic acid behind.

Acetic acid is also obtained by the catalytic oxidation of alcohol with zinc oxide (the acetaldehyde thus produced being further catalytically oxidized to acetic acid); by synthesis from acetylene (another catalytic process); and by synthesis from ethylene (producing alcohol which is oxidized to acetic acid as in the first process).

The strongest acetic acid, known as glacial acetic acid or anhydrous acetic acid, crystallises to a solid at a temperature of 62° F.

Two other strengths of acetic acid found in commerce are 33 p.c. and 4.27 p.c. acids, the weaker being approximately the strength of malt vinegar. Acetic acid in the concentrated state forms the class of salts known as acetates (*q.v.*). Acetic acid is also a solvent of carbon compounds in those industries which depend on organic chemistry.

Acetic Ether. Pleasant-smelling liquid, also known as ethyl acetate, prepared from alcohol by the action of sulphuric acid. Its chemical formula is $C_2H_5(C_2H_3O_2)$. It is used as a solvent in making synthetic fruit essences and in the synthetic preparation of fatty acids, ketones, and other organic compounds.

Aceraceae. The field maple

Acetone. An organic compound ($2\text{CH}_3\cdot\text{CH}(\text{OH})$) of the class of ketones (*q.v.*), of which it is the most important. A colourless liquid with a sweetish, pungent odour recalling wood smoke. Originally obtained in the distillation of wood, it is now prepared by the oxidation of alcohol in a catalytic process and, on a very large scale, by the fermentation of maize starch by the Weizmann bacillus and other bacilli. The latter process also produces butyl alcohol, acetic, butyric and other acids. The acetone and butyl alcohol are distilled off and then separated by fractional distillation. Acetone has special properties as a solvent of organic compounds such as gums, varnishes, resins, fats, celluloid, gun-cotton, etc. It is especially important as the principal solvent for cellulose acetate, the basis for many forms of plastics (*q.v.*). It is used in the preparation of chloroform, iodoform, sulphonal and other medicinal compounds. Very inflammable, it absorbs about 24 times its volume of acetylene, thus providing an excellent illuminant.

Acetone is found in the blood and urine of diabetics and other persons suffering from carbohydrate starvation due to faulty metabolism and a consequent lack of glucose in the tissues.

Acetyl (acet-, and Gr. *hylē*, substance). Radical or base of acetic acid which is chemically acetyl hydroxide. It occurs also in combination with chlorine, bromine, and iodine as acetyl chloride, bromide, and iodide, liquids giving off extremely irritating fumes. Chemically it is $\text{C}_2\text{H}_3\text{O}$.

Acetylene. Hydrocarbon gas (C_2H_2), with a small note unpleasant when pure but very unpleasant as commercially produced. Prepared by the action of water on calcium carbide, itself produced from coal and lime, it is a valuable illuminant and a fundamental material for the preparation of the hydrocarbon plastics, including the important vinyl and polyvinyl series. The well-known polyvinyl chloride (P.V.C.) plastic is a combination of acetylene and hydrochloric acid polymerized under heat and catalysts. Acetylene and acetic acid are polymerized to form vinyl acetate. From acetylene is also produced a series of products used as solvents for plastics (*e.g.* acetone) or as "plasticizers," *i.e.* chemical agents that make cellulose products more flexible and suitable as plastics.

When mixed with oxygen or air

in certain proportions acetylene gas explodes with great violence with an enormous liberation of heat. This fact is made use of in the oxy-acetylene flame, which has the extremely high temperature of over $3,000^\circ\text{C}$. and is used for welding and cutting metals.

Acetylene is a strong illuminant giving a very white flame, a light source sixteen times greater than an equal volume of coal-gas. Its spectrum is very similar to that of sunlight. When liquefied and dissolved in acetone it can be compressed without risk (dissolved acetylene). Acetylene generators for indoor and outdoor lighting consist of carbide chambers, washers, gas holders, and purifiers. Copper piping must not be used owing to the formation of an explosive compound. Acetylene is particularly suitable for outdoor lighting for hand or contractors' lamps of from 20 to 2,500 candle power. See Calcium Carbide.

Achaea (Gr. *Achaia*). Name of an ancient division of Greece. It is on the N. coast of Peloponnesus and is bounded N. by the Gulf of Corinth. Mountainous, with a narrow strip of fertile land along the coast, it is the chief currant-growing district of the mainland. Patras is the chief town. Under the Byzantine Empire Achaea was a despotat or principality, and was conquered by the Turks in 1460. Achaea (or Achaia) now forms a nome or department of Greece, with a pop. of 213,291. There was another Achaea in S. Thessaly. *Pron.* A-ke-a.

Achaean League. Federation of Greek cities in Achaea. The original association of twelve members gradually broke up, but in 281 B.C., after the dissolution of Alexander's empire, ten cities formed a league to check Macedonian encroachment. Under Aratus (d. 213) its influence greatly increased, and under Philopoemen (d. 184) reached its height. After the defeat of Macedonia by Rome at Pydna (168), the sympathies of the members of the league were divided. The Romans seized on internal dissensions and armed resistance to their demands as an excuse for intervention. In 146 the Achaeans were defeated by the consul Lucius Mummius, and Corinth was destroyed. The league was declared dissolved and Achaea became a Roman province.

The head of the league, or strategus, exercised general control over external and internal affairs and commanded in the field. Legislation and questions

of war and peace and alliances were settled by an assembly of citizens over thirty, which met twice a year at Aegium. See Federal Government, E. A. Freeman, 1893.

Achaeans (Gr. *Achaioi*). In Homer, the general term for all Greeks as opposed to Trojans. Strictly they appear to have been the inhabitants of Greece prior to the Dorian invasion. These Achaeans came from the N. some time before 1000 B.C., and displaced a yet older people popularly known as Pelasgians. They seem to have been tall and fair, and were probably akin to the Celts. In historical times the name Achaeans was confined to the inhabitants of the Peloponnesian state of Achaea.

Achard, FRANZ KARL (1753-1821). German chemist and naturalist. Born April 23, 1753, in Berlin, but of French descent, he became famous in connexion with his improvements in the methods of extracting sugar from beet-root. He was supported in his experiments by the king of Prussia, who gave him a farm in Lower Lusatia, where he set up a sugar factory, and was thus the founder of the German beet sugar industry. Later, in Berlin, he conducted important experiments on the electrical behaviour of metals and alloys. He died April 20, 1821.

Acharnians, THE. Comedy by Aristophanes. Performed 425 B.C. during the Peloponnesian war, its object was to support the peace party. It takes its name from the chorus of charcoal-burners from the village of Acharnae, who favour the continuance of the war. Dicaeopolis, an Athenian citizen, in spite of their opposition, concludes a separate peace with the Lacedaemonians.

Achates. In Roman legend, the friend and faithful follower of the Trojan hero Aeneas. Achates is always distinguished by the epithet *fidus* (faithful), and his name has become proverbial. See Aeneid. *Pron.* Akayteez.

Achelous. Longest river wholly within Greece. Now known as Aspropotamo, or white river, it rises in the Pindus mts., flows S. and divides Aetolia from Acarnania before falling into the Ionian Sea. Its length is about 130 m., and at its mouth are extensive alluvial deposits. In Greek mythology, Achelous was a river-god, son of Oceanus and Tethys.

Achensee. Lake in Tirol, Austria, 20 m. N.E. of Innsbruck. It is about 5 m. long by $\frac{1}{2}$ m. broad, and lies amid high and picturesque mountains at an altitude of 3,000 ft.

Achernar. Star in the constellation of Eridanus in the southern hemisphere. Described in the 10th century by the Persian astronomer, Al-Sufi, it is supposed to be identical with θ Eridani, a double star. Its name (Arab. *Akher nar*) signifies the end of the river.

Acheron. In ancient geography, the name of several rivers. The best known was in Epirus. It flowed through the Acherusian lake into the Ambracian gulf, and was regarded with awe as in some way connected with the underworld. Another was in Bruttii, S. Italy. Mythology tells of a river Acheron in Hades, which itself was often called by that name.

Acheson, DEAN GOODERHAM (b. 1893). U.S. statesman. See N.V.

Acheson, EDWARD GOODRICH (1856-1931). American chemist. Born at Washington, Pennsylvania, March 9, 1856, he was educated at Bellefonte Academy, Pennsylvania. In 1886 he discovered the artificial abrasive, carborundum, which he prepared by submitting a mixture of clay and coal to the intense heat of an electric arc. This material is now made on a large scale at a factory which obtains its power from Niagara Falls. Afterwards he prepared artificial graphite from which electrodes and the lubricants aquadag and oiltag are made. Another product of the electric furnace he invented is siloxicon, from which crucibles are made. He died July 6, 1931.

Acheulian. Middle period of the lower palaeolithic age in Europe, when the warm Chellian was followed by a colder climate. Human remains are scarce, but in 1935 a skull dating from Acheulian times was found at Swanscombe.

The flint industry developed greatly, the boucher, or hand-axe, becoming finer, even-edged, ovate, and then pointed, and the flakes themselves utilized. The period was first studied at St. Acheul, on the Somme—whence the name. The stations extend from England, e.g. Wolvercote and Hoxne, across Central Europe to Poland.

Achi Baba. Hill in Gallipoli. A barren ridge nearly 600 ft. high, it sends out rocky spurs on each side to the sea and so forms a

Achi Baba. Ruins behind which rises the barren ridge, 600 ft. in height, which, fortified by the Turks in the Great War, dominated the toe of the Gallipoli peninsula

barrier across the W. end of the peninsula. In 1915 it was fortified by the Turks, and the British attempts to take it were the main incidents in the earlier part of the Gallipoli campaign. See Krithia.

Achiet-le-Grand. Village of France, in the department of Pas-de-Calais. It is a junction for Bapaume on the Arras-Albert rly. Taken from the Germans by the British, March 17, 1917, it was recaptured by the Germans in the spring of 1918, but regained by the British on Aug. 23, 1918. Another village, Achiet-le-Petit, S.W. of Achiet-le-Grand, was also captured by the British in March,

1917, retaken by the Germans in the spring of 1918, and recovered by the British on Aug. 21, 1918.

Achievement. In heraldry, a complete representation of a coat of arms. The shield is surrounded by mantling and accompanied, where the bearer is so entitled, by crest, helmet, motto, supporters, collars and badges of knighthood, and insignia of offices.

Achill OR EAGLE ISLAND. Largest and most beautiful of Ireland's islands. It lies off the W.

coast, forming part of county Mayo, and is joined to the mainland by a bridge across the narrow Achill Sound. Its extreme measurements are E. to W. 15 m., and N. to S. 12 m.; area 57 sq. m. The surface is mountainous (Slievemore, 2,204 ft., Croaghnaun, 2,192 ft.). The Minawn cliffs reach a height of 900 ft. above the sea. Tillage and turf-cutting are the main occupations, and a knitting industry is centred at Dooagh. The island is a popular tourist resort. There are cromlechs, stone circles, and other antiquities. Pop. 4,895.

Achilles. Greek hero, according to legend the son of Peleus and Thetis, and third in descent from Zeus. As king of the Myrmidons, he took part in the expedition against Troy, and in the Iliad, Homer makes him the leading figure on the Greek side; in fact a considerable part of the poem deals with the quarrel between him and Agamemnon (*q.v.*). By his mother Achilles was made invulnerable, the most popular version being that she did this by dipping him in the river Styx. In so doing she held him by the heel; consequently this was untouched by the water and hence originated the proverbial phrase about the heel of Achilles. Thetis further showed her anxiety for her son by disguising him as a girl and sending him to Scyros, in order that he should not sail to Troy; but

Achensee. Picturesque lake of Tirol, Austria, lying amid high mountains, showing the village of Seehof nestling on its banks

Ulysses, visiting the place in the garb of a pedlar, discovered him.

After Achilles had reached Troy he performed redoubtable deeds against his foes. Then came his quarrel with Agamemnon. The

latter, deprived of his favourite, the Greek girl Chryseis, took to himself Briseis, the captive of Achilles, who sulked in his tent and refused to take part in the war. At length the death of his lifelong friend, Patroclus, roused him to action, and, girt with new armour, he rushed again into the fray, and carried

Achilles, Greek hero. Ancient marble statue, from Villa Borghese, now in Louvre, Paris

confusion into the Trojan ranks. Hector, the slayer of Patroclus, was himself killed, and the circumstances of Achilles' own death are variously described, although not by Homer. By some Paris, by others Apollo is named as responsible for it, the fatal wound being given by an arrow which struck Achilles in his vulnerable heel. In the *Odyssey*, Homer tells how his remains were buried on the shores of the Hellespont, and how Ulysses and the Telamonian Ajax fought for his armour, and refers to him as seen by Ulysses in the lower regions.

Achilles. Name of a British light cruiser (7,030 tons) formerly of

pocket-battleship Admiral Graf Spee, Dec. 13, 1939. See *Plate, Battle of the River*; see also in N.V.

Achilles and the Tortoise. Argument used by Zeno of Elea to prove the unreality of motion. Achilles runs a race with the tortoise, which is given a certain start. The distance between them consists of an infinite number of parts, which cannot be traversed in any definite time. The tortoise will, therefore, always be a certain distance ahead, since, the moment Achilles reaches the place formerly occupied by it, it will be no longer there. Aristotle pointed out the main fallacy in Zeno's argument. A given distance, even although infinitely divided, does not thereby become infinite but remains a finite distance which can be covered in a finite time.

Achilles Statue, THE. Monument in Hyde Park, London, near Apsley House. Although the inscription on the pedestal states that the figure is that of Achilles, it is in fact a free reproduction in bronze, by Sir Richard Westmacott (*q.v.*), of one of the colossal marble figures, known as the Horse Tamers, which stand on the Quirinal Hill, Rome. It was cast from cannon captured at Salamanca. Vittoria, Toulouse, and Waterloo. Erected June, 1822, the statue cost £10,000, subscribed by Englishwomen, and was dedicated to "Arthur duke of Wellington and his brave companions in arms." The statue is over 18 ft. high and, with plinth and pedestal of Dartmoor and Peterhead granite, the monument is 36 ft. in height above the road line.

Achin. Region of Sumatra (*q.v.*), Indonesia. Situated on the northern end of the island, it is about 20,500 sq. m. in area. Fishing, boat-building, silk-weaving, and gold-working are its chief industries. The capital is Kuta Raja, on the Achin river, 4 m. inland by tramway from the northern port of Olehleh. Achin has been the scene

of repeated warfare, largely induced by piracy on the part of the natives, who are of Malay descent and were converted to Mahomedanism in the 13th century. The Dutch, to whom Achin with other territory in Sumatra had been ceded by Great Britain in 1824, sent out an

expedition in 1873 to subdue the natives. The Achinese inflicted a severe reverse on the Dutch force, and it required several other expeditions finally to overcome their resistance. Dutch civil government was established in 1880, but hostilities were resumed in 1896 and 1898, and again in 1901-4. Pop. of prov. 789,660.

Achinsk or **ATCHINSK.** Town of the R.S.F.S.R., in the Krasnoyarsk region of Siberia. On the

"Achilles" statue, dedicated to the first duke of Wellington

river Tchulim, a tributary of the Ob, it is 75 m. W. of the town of Krasnoyarsk on the Trans-Siberian rly. Pop. 5,000.

Achish. A Philistine king of Gath with whom David twice found refuge when fleeing from Saul (1 Sam. 21 and 27-9). On the first occasion David feigned madness to avoid recognition.

Achmite. Geological term, synonymous with aegerine (*q.v.*), a green to brown natural silicate of sodium and iron.

Acholi. Tribe of Nilotic negroes in British East Africa, formerly called Shuli. They inhabit the E. bank of the Bahr-el-Jebel, N.E. of the Albert Nyanza. Their mud-lined wattle huts are adorned with ochre designs. Bachelor huts are often built on piles. Their pottery is prized by distant tribes, and they practise scar-tattooing.

Achor. Valley in Canaan. Here Achan was stoned (Josh. 7) for secreting spoil in his tent after the fall of Jericho.

Achray. Small loch or lake in S.W. Perthshire, Scotland, between lochs Katrine and Venachar. It is mentioned in Scott's poem *The Lady of the Lake*. About 1½ m. long and ¾ m. broad, it provides good fishing.

H.M.S. Achilles. British cruiser which took part in the victory over the German battleship Admiral Graf Spee

the New Zealand division. She was completed in 1933 and carried eight 6-in. guns. Manned chiefly by sailors from New Zealand, she joined the *Ajax* and the *Exeter* in a 14-hour attack and chase off the Uruguayan coast on the German commerce raider, the

Achromatic Lens (Gr. *achromatos*, colourless). Optical instrument for correcting the chromatic aberration of white light. When a narrow pencil of white light, such as sunlight, is allowed to pass from one medium to another, as from air into glass, the pencil of rays is not merely bent, but is split up into light of several colours. This phenomenon is referred to as dispersion.

But the dispersive powers of different substances are not the same. We can obtain two prisms constructed of such different materials that, while the angle through which they will bend the average or mean ray of a pencil of light is the same, the amount of dispersion is different; or, on the other hand, when the deviation or bending of the mean ray is different, the amount of dispersion produced is the same. The dispersion produced by flint glass is greater than that produced by crown glass in the ratio of 61 to 43. If two prisms, one of crown glass and one of flint glass, and of suitable angles, are placed with their refracting edges turned in opposite directions—the second being upside down in relation to the first—a ray of white light passing through the first (crown glass) will be bent downwards towards the base, but the red constituent of the ray will be less bent than the violet owing to dispersion.

When these rays, however, having passed through the crown glass prism, set out on their journey through the reversed flint glass prism, the bending or deviation will be in the opposite direction; but the red ray will be less bent upwards than the violet. The difference between the deviations of the red and violet rays being, however, the same in the two prisms, the rays when they leave the second, or flint glass, prism will be parallel. Nevertheless, there will be a general deviation of the rays on the whole because the average or mean deviation in the crown prism is greater than that in the flint. Hence, by combining two prisms, one of crown glass and one of flint glass, the ratio between the refracting angles of the prism having been suitably chosen, we obtain a compound prism which deviates but does not disperse light.

This general principle is applied to construct achromatic lenses, which correct the chromatic aberration of white light when it passes through a lens, and when the curvature of the lens disperses the different coloured rays to different foci. Suppose,

for example, a parallel beam of white light impinges on a convex lens, then where the rays enter and leave the lens the violet rays will be more deviated towards the axis of the lens than the red rays, and thus will come to a focus nearer the lens than the focus of the red rays. With a concave lens the conditions are reversed. If a concave lens and a convex lens of the same material and of equal focal length were placed together, the two dispersions would counteract one another; though in this case there would be no deviation.

But by making the convex lens of crown glass and the concave lens of flint glass, we are able, as in the case of the prisms, to obtain equal and opposite dispersion and still have deviation in the direction of that produced by the crown glass. In effect the combination will be a convex lens with the chromatic aberration eliminated—in other words, an achromatic lens. By the use of two lenses it is possible to make a lens which shall be achromatic as far as the light of two colours is concerned. The combination will not be achromatic for other colours. If instead of two lenses we use three, of different dispersive materials and powers, the combination can be made achromatic for three colours, and so on. The colours for which the lens system is rendered achromatic vary with the uses to which it is put. Thus, in a telescope, achromatism is secured for rays which immediately affect the eye; in photography the lens system must be achromatised principally for the violet rays, and for rays beyond the violet which are called actinic. See Aberration; Light; Spectroscopy.

Achromatin. Cytological term applied by Fleming to that part of the nuclear reticulum (see Cytology) which he found to have little affinity for the usual nuclear stains, in contrast to chromatin, which stains readily with them. The term "linin" was used by Swartz with similar implication. Chromatin and achromatin may prove to be merely the same material in different states.

Achsah. Daughter of Caleb, friend and companion of Joshua. She was given in marriage to Othniel as a reward for his valour in taking the Canaanite city of Debir, and on her wedding day secured from her father certain springs in addition to her dowry (Josh. 15 and Judg. 1).

Achurich, JANET (1864-1916). British actress, whose real name was Janet Achurch Sharp. Born

Jan. 17, 1864, in Lancashire, she first played at the old Olympic Theatre, London, under Miss Genevieve Ward (1883), and later in the Benson Company. In 1889 she joined Charles Charrington, whom she married, in the pro-

Janet Achurch,
British actress
Downey

duction of Ibsen's plays. As Nora in *A Doll's House* she won particular distinction, and Mr. and Mrs. Charrington toured the world with this play, interpreting Ibsen for the first time in English in many lands. In 1911, Janet

Achurich played Mrs. Linde in the revival of *A Doll's House* at the Kingsway Theatre, London. She died at Ventnor, Sept. 11, 1916.

Acid (Lat. *acidus*, sour). Popularly, an acid is any sour substance, but chemically acids are salts of hydrogen, as belonging to a class of substances which always contain hydrogen. Other general characteristics are that they have a sour taste, possess the property of neutralising alkalis to form well-defined salts and change the colour of blue litmus paper to red. As some salts exhibit acid properties, it is necessary to add that the substances must contain no basic elements or group of elements.

It is the presence of hydrogen that gives these compounds their peculiar acid character. Lavoisier held that oxygen is the element to which acids owe their character, but Davy showed that hydrochloric acid (HCl) does not contain oxygen, and Gay-Lussac demonstrated that hydrocyanic acid (HCN) is another acid without oxygen, so the Lavoisier theory had to be abandoned. Other elements than hydrogen are present in acids. If the acid contains oxygen, e.g. sulphuric acid (H_2SO_4), the abstraction of water (H_2O) leaves the anhydride or acid oxide. If the acid contains no oxygen, it is indicated by the prefix *hydro*, e.g. hydrochloric acid (HCl), or hydrocyanic acid (HCN). The termination *ic* indicates that the characteristic element, or group of elements, exercises its highest valency or strength in the form of chemical energy. The termination *ous* means that the second highest valency obtains, while the prefix *hypo*, together with the termination

ous, indicates some lower valency. When an acid contains a high proportion of oxygen, the prefix *per* is used, e.g. perchloric acid.

Some acids on treatment with the hydroxide of an alkali metal exchange all their hydrogen for metal, thus producing a normal salt, while other acids produce acid salts in addition, i.e. all the hydrogen is not replaced. The former variety of acid is termed monobasic, and the latter class polybasic, a term including di-, tri-, and tetra-basic. Formerly all acids were thought to be monobasic, but Liebig enunciated the doctrine of polybasicity, which was further established through the researches of Graham, who showed that phosphoric acid exists in three forms, as ortho-, meta-, and pyro-phosphoric acid.

Inorganic acids or mineral acids are combinations of non-metallic elements with hydrogen only, or with an additional element generally oxygen. Organic acids are considered as derived from hydrocarbons or their alcohols by the replacement of hydrogen (H), or hydroxyl (HO), by the carboxyl group (CO·OH). Organic acids are further divided into aliphatic acids, i.e. those derived from open chain hydrocarbons and aromatic acids from ringed hydrocarbon nuclei. Aliphatic acids are further divided according to the parent hydrocarbon. Examples of inorganic acids are sulphuric acid, hydrochloric acid, and nitric acid, while well-known organic acids are acetic acid, citric acid, oxalic acid, and tartaric acid.

Acidimetry. Chemical process of measuring the amount or strength of acid in solid or liquid substances. If the acid is known to be pure, its specific gravity may give sufficient indication of the strength of the acid, or this may be ascertained by the quantity of alkali needed exactly to neutralise or destroy the acidity. The process being reversible is also known as alkalimetry.

By taking a known amount of a pure alkali, such as sodium carbonate, and neutralising with it the acid of unknown strength, it is easy to calculate, from the chemical reaction, the amount of acid that was present. If, on the other hand, a definite quantity of pure oxalic acid has been used to neutralise a solution of an alkali, the quantity of alkali present can be ascertained. It is necessary that the identity of the substance which is being tested should be established previously

by chemical analysis. The test solutions used are called standard or normal solutions. They are prepared upon such a basis that they bear a relation to the molecular weight of the chemical employed. Only such substances are used for test solutions as can be obtained in a state of purity and remain unaltered in strength for a reasonable length of time.

As both the test solution and the substance that is being tested may be colourless, and afford no visible indication of the neutrality point, certain substances are employed which change colour according as the liquid is acid or alkaline. These are called indicators, among the best-known being litmus—red with acids, blue with alkalis; cochineal, yellowish-red with acids, purple with alkalis; and phenolphthalein, colourless with acids, red with alkalis. The choice of the indicator depends upon the nature of the test that is being made. If the acidimetry is conducted with solutions, and the relative volumes of the liquids furnish the data required, the method is called volumetric. Where the weight of the resulting reaction is the factor taken into account, the process is called gravimetric.

Acidosis. Condition in which certain acids and acetone accumulate in body tissues due to faulty metabolism of fat and scarcity of glucose, as in diabetes. The so-called bilious attack in children is a similar condition.

Acireale. Ancient town and episc. see on the E. coast of Sicily. It is 9 m. by rly. N.E. of Catania, at the S.E. base of Mt. Etna and the mouth of the river Acis, from which it takes its name. It has important thermal springs, is a favourite sea-bathing place, and manufactures silk, linen, cotton, pottery, cutlery, and filigree work. Local features are the cave and rocks of Polyphemus and the grotto of Galatea. Pop. 35,587.

Acis. In classical mythology, a shepherd of Sicily, son of Faunus, beloved by the nymph Galatea. His rival, Polyphemus the Cyclops, crushed him to death with a mass of rock, whereupon the gods changed his blood into a stream of the same name at the foot of Mt. Etna. The story, told by Ovid, is the basis of Handel's secular oratorio, *Acis and Galatea*.

Ackermann, RUDOLPH (1764-1834). German-English publisher and bookseller. Born at Schneeberg, Saxony, the son of a saddler, he came to London,

worked as a carriage draughtsman, and opened a print-shop in the Strand. There he issued a monthly publication called *The Repository of Arts, Literature and Commerce* (1809-28), the series of annuals entitled *Forget-Me-Not*, and illustrated histories of Westminster Abbey, Oxford and Cambridge universities, and the public schools. He introduced lithography to England, and translated a work on the subject by its inventor, Alois Senefelder. He was one of the first inventors of waterproof fabrics for clothing, and promoted gas-lighting in cities.

Acklin OR **ACKLIN'S ISLAND.** Largest of the Crooked Islands, S. Bahamas. It is 45 m. long and 2 m. broad. Pop. 1,744.

Acknowledgment. Legal term chiefly used in relation to the various Limitation Acts, whereby claims to debts or property become unenforceable after a certain lapse of time. These Acts provide that the creditor's or owner's rights shall be kept alive if the other party gives him a written acknowledgment of his rights before the limitation period has expired.

Ackworth. Parish in the W. Riding of Yorkshire, England. It is 3½ m. S. of Pontefract, and is on the rly. At a school here, founded (1779) and managed by the Society of Friends, John Bright and other prominent Quakers received their education. Quarrying is carried on in the neighbourhood. Pop. 4,183.

Acland, SIR ARTHUR HERBERT DYKE (1847-1926). British politician. Second son of Sir T. D. Acland (q.v.), he was educated at Rugby and Oxford, was head of the Military College at Cowley, and became Liberal M.P. for Rotherham 1885-1899. He was best known as a prominent educationalist. He succeeded to the baronetcy in 1919 and died Oct. 9, 1926.

Acland, SIR FRANCIS DYKE (1874-1939). British politician. Born March 7, 1874, son of the above Sir A. H. D. Acland, he was Liberal M.P. for Richmond, Yorks (1906-10), N.W. Cornwall (1910-22), Tiverton (1923-24), and N. Cornwall (1932-39). In Asquith's administration he held several government positions. He died June 9, 1939.

Acland, SIR HENRY WENTWORTH DYKE (1815-1900). British physician. Educated at Harrow and Christ Church, Oxford, he studied medicine at Leyden and Edinburgh. He was regius professor of medicine at Oxford, 1858-94, and largely through his

efforts the study of natural science was introduced at the university. Created a baronet in 1890, he died Oct. 16, 1900.

Acland, JOHN DYKE (d. 1778). British soldier and politician. Eldest son of Sir Thomas Acland, he was M.P. for Callington, Cornwall, in 1774. A vigorous advocate of the war with America, he sailed in 1776 with Burgoyne's expedition. His wife is said to have gone up the river Hudson in an open boat to join him. Acland died Oct. 31, 1778, from a chill caught while fighting a duel.

Acland, SIR RICHARD THOMAS DYKE (b. 1906). British politician. Born Nov. 26, 1906, he succeeded his father, Sir F. D. Acland (*q.v.*), as 15th baronet in 1939. Educated at Rugby and Balliol, he became Liberal M.P. for Barnstaple in 1935. For a time during the Second Great War he served as a gunner. He founded the Forward March group in 1941, and the next year merged it with J. B. Priestley's 1941 Committee to form the Common Wealth party, which he then led until his electoral defeat in 1945. Joining the Labour party, he became M.P. for Gravesend in 1947. In 1943 he transferred to the National Trust (*q.v.*) the family estates at Killerton, Devon.

Sir Richard Acland.
British politician.

Acland, SIR THOMAS DYKE (1809-98). British politician. He was educated at Harrow and Christ Church, Oxford, and gained a fellowship of All Souls. In 1837 he became Tory M.P. for West Somersetshire, but in 1846 followed Sir Robert Peel, and finally joined the Liberal party. From 1865 to 1885 he was M.P. for North Devon. Acland helped to establish the Oxford system of local examinations. He succeeded to the baronetcy in 1871 and died May 29, 1898.

Aclinic Line (Gr. *a*, not; *klinein*, to bend). Line along which there is no dip of the magnetic needle. Elsewhere, owing to the magnetic attraction of the earth, freely suspended and horizontally balanced needles dip downwards at one end after having been magnetised. The aclinic line, also called the magnetic equator, makes an irregular curve roughly following the equator.

Aconagua. The giant of the Cordillera, as seen from one of the high Andine valleys. It gives its name to one of the provinces of Chile

Lines along which the magnetic dip is everywhere the same are called isoclinic lines.

Acne. Chronic disease of the skin, most frequently caused by obstruction of the ducts of the sebaceous or oil glands. Several forms are recognized, the commonest being *acne vulgaris*, which appears most frequently on the face, back of the neck, back, and chest. The first sign is an eruption of small red pimples, which may suppurate, and often in the centres of these a small black point, a "blackhead" or *comedo*, the obstructed termination of the duct, may be seen. Treatment is by local applications and building up the constitution by healthy living.

Acoemetæ (Greek *akoiemetos*, sleepless). Eastern monastic order which flourished in Constantinople in the 5th century. It was dissolved for heresy in 533. The Acoemetæ regulated their worship so that it was continuous day and night, presumably on a literal interpretation of 1 Thes. 5, 17.

Acolyte (Greek *akolouthos*, attendant). Name given in the Roman Catholic Church to a young cleric of the fourth minor order ranking next to a subdeacon. His office, first mentioned at Rome in the 3rd century, was that of a candle-bearer. The name is also given in the Anglican church to one who performs the same duty.

Acoma. Indian village in New Mexico, U.S.A. It is 80 m. W.S.W. of Albuquerque, and is supposed to be the oldest continuously inhabited place in the States. The Spaniards visited it in 1540, and later ravaged it, and about 1630 the Franciscans established a mission here. It stands on a

sandstone rock or *mesa*, at an alt. of 250 ft. above the floor of the cañon, which is here 6,040 ft. above sea level, and is approached by a winding stairway. Around it is an Indian reservation of nearly 100,000 acres.

Aconagua. Highest mt. in S. America, some 90 m. E. by N. of Valparaíso. An extinct volcano, it is in the Andes on the borders of Chile and Argentina, the summit, 23,081 ft., being in the latter country. It was first ascended in 1897 by Zurbriggen. A river of the same name rises on its S. slopes and flows 200 m. to the Pacific.

Aconagua. Central prov. of Chile. Extending from the Andes to the Pacific, it is mountainous and is traversed by the Aconagua river. The climate is hot and dry, and the soil fertile in the river valleys and where it is irrigated. Fruits, alfalfa, and wine are the chief products, and copper, silver, lead, and iron abound. The capital is San Felipe, and the area 3,939 sq. m. Pop. 118,049. *Consult* Aconagua and Tierra del Fuego, W. M. Conway, 1902.

Aconcio, GIACOMO (1492-1566). Italian philosopher, theologian, jurist, and engineer. Having left the Church of Rome, he was banished and took refuge in England. He became a favourite of Queen Elizabeth, to whom he dedicated his *Stratagems of Satan*, written in a tolerant spirit, which made him many enemies. Philosophically, he anticipated Descartes.

Aconite (Lat. *aconitum*, wolf's bane). Plant better known by its common name of monkshood. In medicine the root of this plant is used for the preparation of both

a liniment and a tincture. All parts of the plant are very poisonous, and death has occurred from eating the root in mistake for horse-radish. Aconite root is brown, tapering to a point, with curly rootlets; while horse-radish is white, cylindrical, and without rootlets. Aconite produces a tingling sensation when tasted, followed by numbness, while horse-radish is simply pungent.

Aconite, the common monkshood

The active principle in the plant is an alkaloid, aconitine, which is one of the most deadly poisons known, paralysing the ends of the nerves and the spinal cord, and bringing about death from arrest of respiration. The treatment in cases of poisoning, while waiting for medical assistance, is promptly to give an emetic, keep the patient lying down, apply warmth and friction to the limbs, and artificial respiration if the breathing is failing.

Acorn. Fruit of the oak-tree (*Quercus*). Botanically it is a nut, standing in a cup which is composed of a large number of consolidated bracts.

Acorn Barnacle. A popular name for the genus *Balanus* of the crustacea known as cirripedia. Common objects of the seaside, they are enclosed in a shell, but in the larval state the young at first swim freely about, developing, after several moults, a sucker by which they adhere to any convenient object. These acorn barnacles encrust rocks and

Acorn barnacles. Large form of the genus *Balanus hameri*

shells. One species attaches itself to the skin of the whale, and another burrows into the skin. But they are not true parasites, since, unlike these, they do not derive sustenance from their host.

Acorus. Genus of two hardy perennial plants, belonging to the family Araceae. They are plants of

the water-side, and are known popularly as sweet flags (*q.v.*). They are grown chiefly in the muddy edges of ponds and ornamental lakes. They attain to a height of 3 ft. or thereabouts, and the small yellow flowers are in evidence during the summer. They are increased by division of the roots in the early spring.

Acosta, JOSÉ DE (1539-1600). Spanish Jesuit. He became a missionary in Peru, being one of the first to arrive in Lima. Afterwards he was head of a college at Valladolid, and rector of Salamanca University. He wrote in Latin a History of the Indies, which was translated into Spanish and other languages.

Acoustics (Gr. *akouein*, to hear). The normal interpretation of the word is the behaviour of sound in rooms and halls, as it affects the hearing of speech and music. The Greeks and later the Romans designed large amphitheatres with acoustic effects in mind. In modern building great attention is given to the subject.

The following are the main requirements which have to be met:

(1) Loudness should be adequate.

The distance that the human voice can carry in the open air is usually 50 ft., which means restricting the number of persons in an outdoor audience to 2,000.

(2) Reverberation should be controlled, particularly inside halls. Each sound must die away rapidly enough so that it is not confounded with subsequent sounds. At one time it was thought that the stretching of wires across a hall reduced reverberation, but this has been disproved. The rate of decay of reverberation, in terms of the time that a note takes to die away to inaudibility, can be calculated and checked by test. About one second is found to be satisfactory for small halls and up to two seconds for large halls.

Reverberation can be controlled by the use of sound-absorbent materials. Porosity of the surface is an essential, and special plasters and fibre boards are available for this purpose, the sound absorption qualities being as much as ten times those of normal interior surfaces. The sound absorption of a person is about 30 times that

of a wooden seat, and approximately $2\frac{1}{2}$ times that of an upholstered seat. Since often as much as half the sound absorption in a theatre may be due to the audience, the additional advantage of upholstered seats is clear.

(3) Echoes require to be controlled. The time interval between direct and reflected sound should not exceed $1/50$ th of a second.

(4) External, main, and partition walls must be sufficiently soundproof to exclude outside noise.

Noise may be transmitted to a room by windows, ventilators, or cracks; by vibration of the walls, ceiling, or floor; and by direct transmission of waves from the walls, ceiling, or floor.

Resistance to airborne sound is related to the weight of the intervening structure and is not much affected by cavities unless there is a discontinuity, *i.e.* a hollow wall, in the structure. The nature of the material is of importance, *e.g.* increasing the thickness of a brick wall ten times will only double the sound insulation, whereas with hard felt the insulation is increased directly in proportion to the thickness.

The joint work of the National Physical Laboratory and the Building Research Station has made available much valuable information, and experiments have shown that discontinuity can be of great value, not only for airborne sound but especially where vibration is set up through impact. In a block of flats, for instance, where a false ceiling is provided, the provision of partitions separate from the main structure is of great value. In another example a $\frac{1}{2}$ -in. thick quilting of glass silk was laid on the structural concrete floor: on this building paper was laid before placing a 2-in. reinforced concrete floor, resting on the glass silk.

G. R. FALKNER NUTTALL

Acquaviva, CLAUDIUS (1543-1615). Fifth general of the Jesuits. Born at Naples of a noble family, he joined the Society of Jesus in 1567, and was elected general in 1581. His scheme for regulating Jesuit education, *Ratio atque Institutio Studiorum*, 1586 and 1591, is still authoritative within the society. He died at Rome, Jan. 31, 1615.

Acqui (anc. *Aquae Statiellae*). City and episcopal see of Italy, Alessandria province. On the Bormida, 37 m. N.W. of Genoa, it was a Roman bathing station, and its warm sulphur springs are still frequented. It has a

12th century Gothic cathedral, an old castle, and remains of a Roman aqueduct. The chief manufactures are silk and wine. Pop. 16,500.

Acquiescence (Lat. *ad*, to; *quiescere*, to rest). Legal term, sometimes called "sleeping on one's rights." A person who, knowing his rights, chooses for a time not to enforce them, so as to induce another to believe that he does not mean to do so, will, in a court of equity, be debarred from enforcing them. He "will not be allowed to complain."

Acquittal (Lat. *ad*, to; *quietare*, to quiet). Legal term, meaning the discharge of an accused person by order of the court after he has been properly indicted. Acquittal is a bar to any further prosecution for the same matter.

Acquittance. A legal term, meaning a written discharge of a sum of money due. It is commonly called a receipt.

Acre (Gr. *agros*, field). British imperial land measure containing 4,840 sq. yds. It is divided into four roods. Originally it was the amount of land which a yoke of oxen could plough in a day, and consequently its extent varied. It is now fixed by an Act of Parliament, but local acres, generally smaller in size than the statute acre, still survive in Scotland, Ireland, and parts of England. The word, variants of which are found in most European languages, is occasionally used to denote open ground generally or a particular piece, e.g. the familiar God's acre. See Weights and Measures.

Acré OR **AQUIRY**. River of Brazil. Rising on the Bolivian frontier, it flows E. and N to join the Purus. The name is also given to a territory, 59,000 sq. m. in extent, which Brazil purchased from Bolivia for £2,000,000 in 1903. The territory is rich in rubber forests and its chief town is Port Acré or Alonzo. Pop. 86,638.

Acre, **St. JEAN D'**, OR **AKKA**. Seaport and town of Palestine. On a promontory at the base of Mt. Carmel, 80 m. N.N.W. of Jerusalem, it is connected by rly. with Haifa and Damascus. The harbour is partly sanded up, and shipping goes mostly to Haifa. It trades in cereals, oil, etc. Apart from the ruined Crusaders' walls, few old buildings remain.

Of remote antiquity, the *Accho* of the O.T. (Judges 1), and the Ptolemais of the N.T. (Acts 21), Acre, known as the Key of Palestine, was captured by the Arabs in 638. Taken by the Crusaders under Baldwin I in 1104, it was reduced by Saladin in 1187, but Richard Cœur de Lion re-

covered it in 1191. It was handed to the Knights of S. John in 1229, and again lost by the Christians in 1291. The Turks took it in 1517, when it fell into decay. After its revival, a French trading community settled here, and Napoleon besieged it in 1799, but was defeated by the Turks aided by Sir Sidney Smith's sailors. In 1832 Ibrahim Pasha captured and held it till 1840, when it was bombarded and taken by the British, Austrian, and Turkish fleets. It was restored to Turkey the next year. During the Great War Acre was occupied by British cavalry under General Allenby, Sept. 23, 1918. During the Second Great War the Syrian Convention was signed at Acre on July 14, 1941, by Gen. Sir Henry Maitland Wilson and the plenipotentiary of the Vichy government, Gen. de Verdillac. Its terms involved the

and had a son Perseus, by whom, when he grew to manhood, Acrisius was accidentally killed.

Acrobat (Gr. *akrobatos*, walking on tiptoe). General term for a professional performer on the trapeze, a tight-rope walker, or a tumbler. In mediæval times such performers, male and female, were called in England tumblers, and their feats are illustrated in several 13th and 14th century MSS. There was a famous rope-dancer named Jacob Hall in the reign of Charles II, and, later, Richer, a celebrated acrobat at Sadlers' Wells. Street acrobats were common in Victorian times; and some are still to be met with at country fairs. A troop of acrobats has always been one of the stock turns of a travelling circus, and daring trapeze performances are to be seen at the chief music halls. A clever acrobat was Charles Blondin.

Acre. General view of the world-famous seaport. Known as the Key of Palestine, it has been the object of fierce contest in many wars.

occupation of Syria by Imperial and Free French forces. Pop. 9,800.

Acridine (Lat. *acer*, sharp). Basic substance ($C_{12}H_9N$) contained in crude anthracene. From this it can be extracted as acridine chromate by adding sulphuric acid and potassium bichromate. On treating the acridine chromate with ammonia the base is obtained. The most characteristic property of acridine is that it causes sneezing when its dust or vapour is inhaled. It is the active ingredient in electric snuff. Acridine derivatives are employed as dye-stuffs.

Acriflavine. Official name of the antiseptic, flavine (*q.v.*).

Acrisius. In Greek mythology, king of Argos and father of Danaë. To prevent the fulfilment of an oracle, which declared he should be slain by his grandson, Acrisius shut up Danaë in a tower. There, however, she was visited by Zeus in the form of a shower of gold,

who in 1859 several times walked across a tight-rope over Niagara Falls. See Le Roux and Garner's *Acrobats and Mountebanks*, Eng. trans. A. P. Morton, 1890.

Acrocerania (Greek *akros*, highest; *keraunos*, thunderbolt). Promontory of Albania, now called Cape Glossa or Cape Linguetta. It had an evil repute in classical times, especially among sailors, and Horace refers to its ill-famed rocks. Shelley mentions it in his poem *Arethusa*, as does Tennyson in his short poem, *To E. L.* on his *Travels in Greece*.

Acrogens (Gr. *akron*, top; *gen*, to be born). Plants that grow by additions to the summit only. The term was formerly used to denote the higher Cryptogams, ferns, mosses and horsetails, while the lower Cryptogams, algae and fungi, were called amphigens (growing all over). Apical growth occurs also in algae, however. But both terms are now obsolete.

Acrolith (Gr. *akron*, extremity; *lithos*, stone). This name is given to the earliest examples of Greek statuary and marks the transition from the use of wood to that of stone and marble. The trunk of an acrolith was of wood, either carved to represent drapery and then gilded, or covered with actual cloth hanging in folds; the head, feet and

Acrolith depicted on a Greek vase

holds were Tiryns and Mycenae, Acrocorinthus and the Cadmea of Thebes, but the term is specially applied to the acropolis of Athens, generally known as *the* acropolis. This is a long mass of rock 500 ft. above sea level, at its highest point, and precipitous except on its western side. The approach, called the Propylaea, is a wall of Pentelic marble, with five gateways.

During the Persian war its buildings were destroyed but rebuilt by Cimon, and in the age of Pericles it was adorned with splendid specimens of Athenian architecture: the Parthenon, or temple of the maiden goddess Athena, from which the Elgin

published in 1882. The titular essay describes the author's journey in 1879 across the United States to San Francisco. He describes his experiences in an emigrant train and puts in a plea for the Red Indians and Chinese. Another essay describes Monterey, the old capital of California. After discussing Fontainebleau, in *Random Memories* and *The Lantern Bearers* he deals with episodes of his youth and boyhood. Following an essay on *Dreams* and a characteristic one on *Beggars*, the collection ends with *Pulvis et Umbra* and *A Christmas Sermon*, the former one of the most remarkable of Stevenson's productions

Said to have been built by Cecrops, legendary first King of Athens, the Acropolis has been in turn fortress, sanctuary, and museum. Its buildings have served for more than 2,000 years as models for some of the most admired structures in the world. They include the ruins of the Temple of Victory, the Parthenon, and the Erechtheum. (See col. plate facing p. 1)

ACROPOLIS: THE ANCIENT CITADEL OF ATHENS, VIEWED FROM THE SOUTH-EAST

hands were in stone. These early statues represented either a god or a priest. See *Chryselephantine*.

Acromegaly (Gr. *akron*, top; *megas*, large). Rare disease, the most prominent symptom being enlargement of the bones, particularly those of the jaw, hands and feet. It is due to enlargement of the pituitary gland at the base of the brain and is frequently associated with gigantism. A pituitary gland operation may improve the condition.

Acropolis (Gr. *akros*, topmost; *polis*, city). Greek hill stronghold. Applied originally to a site on the top of a rocky hill, the word came to mean the citadel itself, which gradually became a political and religious centre. Such strong-

Marbles, now in the British Museum, were brought to England by Lord Elgin in 1812; the Erechtheum, sacred to Poseidon, god of the sea, and to Erechtheus, a mythical king of Athens; the temple of Nike Apteros or Wingless Victory; the Odeum, a hall for musical entertainments, built by Pericles; the theatre of Dionysus; and a temple of Asclepius (Aesculapius). The statues included the colossal Athena Promachos in bronze; the ivory-and-gold statue of Athena by Pheidias in the Parthenon, and six statues of maidens known as the Caryatides in the Erechtheum. See Athens.

Across the Plains. Volume of essays by R. L. Stevenson

and both containing much of his philosophy of life.

Acrostic (Greek *akron*, end; *stichos*, row). Series of lines of which the first words are chosen because their initial letters, read downwards, compose a word or sentence. In the double acrostic ingenuity is carried to the further point of making the terminal letters of each line perform a similar, complementary, function. Although now regarded as mere literary trifling, acrostics once engaged the serious attention of poets and poetasters. Sir John Davies (1569-1626) is more generally remembered for his twenty-six Hymns to Astraea, the initial letters of every one of which form the words Elisabetha Regina, than

for his eminent services as a lawyer. Acrostics were a form of poetical composition among the Hebrews, e.g. Ps. 119, and sometimes among Christian poets.

Acroterium. In classic architecture, a pedestal for a statue on the apex or at one of the lower angles of a pediment. The feature occurs frequently in neo-classic work. The term is sometimes used improperly of the statue itself when in position.

Act (Lat. *actus*, done). In English law, a term generally relating to something, not done in court, which has some legal effect. When a man seals a deed, he generally touches the seal and says, "I deliver this as my act and deed."

Act. In drama, that portion of a play which is performed continuously, and is followed by a brief period of rest, or *entr'acte*, intended to denote the passage of time. This division, even that into five acts, dates back to Roman times. On the other hand, the ancient Greek drama was not thus divided, breaks in the action being filled in by choric passages. Modern dramatists have largely broken with the five-act tradition, and their plays are frequently divided into no more than three acts indicating three more or less definite stages in the story unfolded—exposition, development, and climax. An act may consist of one or several scenes. See Drama.

Acta Diurna (Lat. daily acts). Official bulletin published daily in Rome after 59 B.C. by order of Julius Caesar. The vehicle for public notices of various kinds, its scope was not unlike that of The London Gazette.

Actaeon. In Greek mythology, a famous huntsman, pupil of the centaur Cheiron. Having watched the virgin goddess Artemis (Diana) bathing, he was changed by her into a stag, in which form he was torn to pieces by his fifty dogs on Mt. Cithaeron. The dogs are supposed to represent the dog-days which destroy vegetation.

Acta Pilati (Latin, Acts of Pilate). Name given to the first part of the spurious Gospel of Nicodemus. Originally written in Greek, it was circulated in Latin and other languages before the invention of printing. It purports to be an official report of the trial and crucifixion of Christ, drawn up by Pontius Pilate.

Acta Sanctorum (Lat. Acts of the Saints). Collection of histories and legends of saints and martyrs projected by Heribert Rosweide (d. 1629), and begun at Antwerp in 1643 by Jan van Bolland, a Jesuit. See Bollandists.

ACTING: THE ART OF THE STAGE

F. G. Bettany, and *Donald Wolfitt, Leading Shakespearian Actor

This subject may be studied further under such headings as Drama and Theatre, Comedy and Tragedy, and in the biographies of eminent actors and actresses which appear under their respective names

The origins of the art of acting, like those of drama, are probably to be traced in ritual, associated as that must usually have been with dancing. To this, which from a religious gradually became a communal affair, first pantomime, then recitation or dialogue would be added. Masks were worn by primitive tribes, and masks long kept their place in connexion with the art; early players sometimes copied the appearance and movements of animals—so perhaps arose comic acting—and only by degrees would speech replace mere incantations of magic. Some such outline of development appears warranted by the researches of anthropology and reports as to stage beginnings in the East, but we do not tread relatively firm ground until we reach the classical territory of Greece.

isation than Comedy, either old or new, and apparently the tragedians intoned their speeches.

Padded in figure, debarred from facial display, raised as on stilts upon the cothurnus, they had to rely almost wholly on voice with audiences that might be ten times as large as ours. Thus the performance of Aeschylus as actor can have been scarcely more than declamatory recitation. More like modern acting may have been that of Polus, reproached with carrying his son's ashes in the rôle of Electra to stimulate his emotions. The talent of comedians has few Hellenic eulogists, and generally it may be said of the actor that it was in Rome rather than in Greece that he attained his apogee. Roscius, freed slave made senator, genius in comedy, and trainer of Cicero in diction, may rank as prototype of his profession.

In few spheres can history be seen repeating itself more exactly than in that of acting. In the Middle Ages, really a new civilization, it starts again much as in Greece or the East. The first medieval actor was the priest who dramatised his Church's service; and in the miracle plays, until they were given in the streets, the clergy must have monopolised the acting. With their withdrawal, such plays, and also the moralities, became municipal undertakings which guilds shared in managing, and in which citizens represented the characters. Shakespeare, of course, has a skit on these artisan amateurs. Taste took no exception to nakedness where implied in the text, and realism in scenes of torture and chastisement made the acting of such a serious ordeal.

Clowning folk-comedy passages figured in most miracle plays, and from quite early days seem to have been left to professionals. As the divorce between Church and stage widened and the mysteries passed into the hands of artisans, and from theirs into those of strolling players, the clergy's attitude changed, with the result that before the end of the 16th century interdicts vetoed performances of ecclesiastical plays everywhere. The Church complained of the ignorance of the actors, their lack of fluency or of a decent accent, their tricks of false emphasis and of contradicting the sense of their words by their gestures—a far

Actaeon changing into a stag and attacked by his dogs
Antique in British Museum

Here, in the festivals from which tragedy and comedy derive, there was a processional or communal element, perpetuated in the chorus. Playwrights began by being dancers who taught the crowd the songs and dances of their craft. Their songs would describe some god's or demi-god's adventures; when the leading man impersonated his hero, instead of singing about him, real acting had arrived. The masks used, the choice of superhuman types, and the inevitably lyrical presentment of their passions would make for formality in acting, and give far less scope to character-

higher level seems to have been reached in secular plays by Hans Sachs and his tradesmen colleagues in Germany at this time—and so with the discouragement of the civic fraternities the boards were cleared for the advent of the professional.

Acting: Raised to an Art

The French farce players provided something of the sort. But their methods were coarse, their technique was trivial alongside the work of exponents of the famous Italian comedy of art, improvisers who, to the mere skeleton of a scenario, supplied business and dialogue, and often long tirades or interludes of pantomime. Their parts, it is true, were stock types repeated in play after play. Yet here at last we get acting raised to an art. At their best these men and women studied, experimented, went in for team work, not only employed their voices, faces, memories, and command of feeling, but invented, exercised imagination, collaborated with their author. No wonder their fame spread over Europe, and their vogue, despite the artificiality of characters such as Harlequin and the rest, some of which Molière was not above borrowing, lasted for generations, though now we discover traces of them only in our puppet shows.

On the English stage talent soon revealed itself with the opportunities afforded by Shakespeare. The man who played Richard III, Hamlet, Othello and Lear in the poet's own lifetime must have satisfied even so severe a critic of acting. We are told that Burbage had a Proteus-like art. Possibly we might have found him too declamatory, for the Elizabethan stage, whatever its structure, was essentially a platform stage, and the appeal of the theatre was, and continued to be, rhetorical and perhaps statuesque rather than, as in our days, pictorial, till the last relic of the apron (or projecting part of the stage between the footlights and line of the curtain) disappeared and the proscenium arch served as frame for a picture. So it was quite easy for a Rosalind to step out of a play and address her audience.

Boys played heroines' parts, women being kept off the English stage longer than from Continental stages; they were popular, and boys' companies at one time threatened to rob the adult actor of a living. But this was effected temporarily, not by them, but by the Puritan. With the Restoration, to the reopened theatres came the actress, scoring

at first chiefly as comedienne. Her influence would seem to have bettered the technique of comedy acting, certainly in France well before the close of the 17th century, as we can judge from the account Molière gives in his *Impromptu de Versailles* of his conduct of a rehearsal. He bears witness to the care taken about accentuation, character-painting, and ensemble. Nor was the French theatre of this era without its genius, Baron, whose greatest triumphs came after Molière's death.

Betterton, to turn to England again and go back a little in time, would seem to have had a stiffer style. Authoritative, wonderful in the expression of awe—as Hamlet's in the Ghost scene—full of a rather pompous oratorical power, he gave his time what it asked, dignity, and avoided what it shrank from—anything that jarred on its ideas of good form and deportment. Despite Malone's praise, we can hardly believe Betterton to have shown much imagination or flexibility. It was left to Garrick, despite his quaint dressing of Romeo and Macbeth, to restore naturalism to the stage and replace tumid declamation by insistence on the human element in acting. If he supplied neither romance nor historical colour, his versatility and the suppleness of his diction are unquestionable. Able to carry away his audience equally by the passion of his Lear and the drollery of his Brute, he needs no modern certificate as to his range. It is this which entitles him, rather than a Schröder, to stand as representative actor of his century.

Convention versus Realism

There was much, however, for the stage to learn even after Garrick's reign—greater concern for the subtleties of character, a keener instinct for the picturesque, historical imagination, the ability to suggest what is fanciful and spiritual in art. Between whiles, the old fight goes on between convention and realism. The personality of a Clairon or a Siddons may recommend what is formal in delivery and pose for a time, but there is sure to be reaction. And so we see repeated efforts to return to nature in the methods of a Talma, a Lemaître and perhaps a Rachel in France, or a Kean and a Macready in England. A Phelps holds on to tradition, while an Irving or a Tree, with a feeling for the pictorial and modern ideas of psychology, interprets familiar characters in a way to lend them novelty and depth. Each age has the woman player who realizes its

ideals; thus, with the Anglo-Saxon community the gentle Helen Faucit, the romantic Adelaide Neilson, the virginal Mary Anderson, the buoyant, full-blooded Ada Rehan. Acting, in fact, if it is to keep alive, must be constantly readjusting its technique to catch the tones, gestures, and fashions of contemporary life. But as certainly it is always being dragged back to artificiality. Great players create a legend which it is the function of the young to destroy, and the task of the latter is rendered all the harder by the accretion of "business" which has settled round well-known parts.

Equipment of the Actor

It is time to ask what is the equipment of the ideal actor. Since he must be a perfect instrument and his body must form no small part of that, he should, unless specialising in comic or eccentric character, be well proportioned, have an agreeable bearing, and possess features which are mobile and can be built up into something like beauty or strength. He should keep himself physically fit, be a fair adept at fencing, have mastered the tricks of make-up, be able to wear clothes of all periods easily, and gesticulate far more freely than is common in English private life: he should have learnt repose, and with it the manipulation of the hand, the carriage of the person, and the art of throwing himself into graceful postures. He should be acquainted with the customs and manners of different eras and know, if only to reject, the traditional glosses on the more famous rôles. He should own a trained and musical voice, have the gift of memorising, and the adaptability to work in ensemble, to keep inside the stage picture and to form a picturesque part of it. He must have the instinct for phrasing, no less important, as Charles Wyndham showed, in comedy than in poetic drama; he must live the character he plays as much when silent as speaking. Finally, to say nothing of imagination and brains, no bad substitutes for genius, he must have laughter, emotion, and every mood ready at the playwright's call, and even have power to serve as his colleague. Stage dialogue is a shorthand which the actor is expected to translate and expand.

Which is the best histrionic material—a personality that is wax-like, with no strongly marked characteristics or one that is definite and assertive? Should a player be able to merge all that individualises him, or may he

These studies in the art of giving facial expression to the emotions of assumed character were specially made for this encyclopedia by Mr. Donald Wolfit, the well-known Shakespearian actor, and Miss Rosalind

Ida. The emotions they illustrate are: 1, Reproach; 2, Grief; 3, Amusement; 4, Dislike; 5, Dictatorship; 6, Joie de Vivre; 7, Cunning; 8, Horror; 9, Contemplation; 10, Amiability; 11, Mirth; 12, Supplication

ACTING: TWELVE STUDIES IN THE DIFFICULT ART OF FACIAL EXPRESSION

Photographs specially prepared for New Universal Encyclopedia by Vandyk

adapt the character to fit himself? In practice we have both types. Irving insisted on making his Shylock romantic, dignified, and sympathetic. Duse rubbed all the hardness off a Magda and gave us Eleanora Duse in every rôle. The modern tendency, on the other hand is to suit parts to actors and encourage them in an eternal self-exploitation.

Should players feel their parts? Most English actresses have wept with their heroines; a Coquelin would have regarded emotionalism as part of his technique. Indeed, Coquelin urged that all art is a distortion of nature, so regulated as to be accepted for it. Undoubtedly there is an element of exaggeration in all acting. It involves over-accentuation of gesture—English gesture at least—over-emphasis of speech, and a certain calculated surrender to, or pretence of, feeling. Not a few players, including so fine a comedienne as well as mistress of emotion as Mrs. Kendal, seem to find laughter more difficult to evoke than tears.

Acting may sometimes take away from the author's purpose, but if it has genius it adds something—not easily defined, but dependent on imagination, personal magnetism, instinct. The great actor has intuitions, tones, lightning flashes which pedantry denies at its peril. The critic who wants to claim all credit for the literary artist and reckons the actor as his mere tool or marionette had better sit at home with his own private puppet show, while folk with warmer blood in their veins are thrilled by some modern Salvini or laugh with the newest Nell Gwyn.

F. G. Bettany

The above résumé of the art of acting, written for the original edition of this Encyclopedia, is in every respect admirable, and there is nothing a modern reviser needs to change. It remains unaffected by the little that happened in the art of the theatre between the two Great Wars. The advent of the talking film, which is still in a comparatively early stage, has perhaps robbed the theatre of the necessity for great spectacular productions and brought it back to simpler methods; so that virtuosity and the personal contact of great acting is once more in demand. Under-acting and plays of understatement were typical of the period, but represented an ephemeral phase. The turmoil of war

and the invasion of Great Britain from the air has brought a new audience to the British theatre which, after a spate of film-going, is as ready to be moved by great acting as it is by great musical composition and orchestral interpretation. Under the influence of creative artists, the vitality of great drama is surging upwards again.

Donald Wolfst

Actinic Rays (Gr. *aktis*, ray).

Rays of sunlight which do not give out heat, but produce chemical changes, as in photography. A beam of sunlight is made up of rays which range in colour from red to violet. Beyond these red rays are invisible rays called infra-red, and beyond the violet other rays, also invisible, known as ultra-violet. The infra-red rays and those in their neighbourhood were regarded as those giving out heat and were thus called calorific rays. The rays at the other end of the spectrum, the ultra-violet, which are of much shorter wave length, do not give heat, but are much more active in producing chemical changes. They were first called actinic or chemical rays by Sir John Herschel, and before photographic emulsions were made sensitive to red and infra-red rays, the term was applied only to the blue, violet and ultra-violet. The ultra-violet rays have also been called Ritterian rays after their discoverer, Ritter. See Infra-red Radiation; Light; Ray Therapy.

Actinium. Chemical element, atomic no. 89. A radio-active substance accompanying thorium extracted from pitchblende, it was discovered by Debierne in 1899 and isolated in Chicago in 1948 by the bombardment of radium with neutrons. It disintegrates on keeping, seven successive radio-products having been identified as formed during the process. Actinium emanation renders bodies with which it comes in contact temporarily radio-active. Approx. 10 tons of uranium ore would yield one 30,000th of an oz. of actinium.

Actinograph (Gr. *aktis*, ray; *graphein*, to write). Instrument used in conjunction with the Herschel actinometer for recording the variations in power of the solar rays. It is a self-registering photometer.

Actinolite (Gr. *aktis*, ray; *lithos*, stone). Natural silicate of calcium, magnesium, and iron. A member of the group of monoclinic amphiboles, it contains no alumina and is green in colour.

It occurs in fibrous aggregates, or elongated crystals, and is a common constituent of crystalline schists and thermally metamorphosed rocks.

Actinometer. Instrument for measuring at any moment the direct heating power and chemical properties of the solar rays. See also Exposure Meter.

Actinomycolosis (Gr. *aktis*, ray; *mykēs*, fungus). Disease in cattle, occurring rarely in the horse, and sometimes in sheep, pigs, and dogs. Human beings occasionally suffer from it. In cattle it is commonly known by the name of wooden tongue, because it usually attacks that organ, producing a hard growth. The disease is due to a parasite known as the ray fungus, which enters the animal by means of some foodstuff, especially barley, on which the fungus grows. This makes its way into the animal's tissues through some abrasion in the mucous membrane or through a bad tooth, and thus irritates the tissues and produces a tumour which is followed by suppuration and ulceration. See Bacteriology.

Action (Lat. *actio*). Term used in various senses. In physical science action at a distance is referred to in Newton's third law of motion thus: "to every action there is always an equal and contrary reaction; or the mutual actions of any two bodies are always equal and oppositely directed." When one body acts on another body so as to influence it, then the whole phenomenon of the mutual action is called a stress. Hence Newton's third law states that all forces are of the nature of a stress between bodies or portions of matter, since every force must be accompanied by an equal and oppositely directed reaction.

If you press your hand on a table, you feel the table pressing your hand. If a horse is towing a boat, the forward pull of the horse on the towrope is exactly equal to the backward pull of the towrope on the horse. In such a case it is easy to see how the horse exerts a force on the boat, because it is by the stretched rope. But sometimes it is not possible to detect the agency by which one body acts on another—as when a piece of iron is attracted by a magnet, or the waters of the earth are attracted by the moon. In these instances we ordinarily use language which implies that matter can act upon matter at a distance, without any connecting agency, by means of an agent which we call force. Nevertheless, we are unable to think of one portion of matter

acting on another without something connecting the two, by which the action is transmitted. This something was called the *medium* of the transmission of these forces, and although no one could imagine the real nature of this medium which enabled bodies to attract one another even at stellar distances, yet it was confidently asserted that such a medium, usually called the luminiferous or light-bearing ether, did exist. The famous Michelson-Morley experiments between 1887 and 1904 indicated that the ether of space was useless as a postulated medium for the transmission of action between bodies; and, further the development of the theory of electro-magnetic radiation to include light, heat and all forms of radiation, made the conception of a physical ether increasingly untenable. In 1905 Einstein developed his theory of relativity (*g.v.*), which made the ether an entirely superfluous concept. No explanation of action at a distance has been provided, and the propagation of radiant energy remains unexplained. *See Ether; Light; Radiation.*

Action. In legal phraseology this term means "a civil proceeding commenced by writ, or in such manner (*e.g.* by originating summons) as may be prescribed by rules of court." Thus, divorce suits are not actions, nor are bankruptcy proceedings, because they are commenced by petition and not by writ. Nor are criminal proceedings actions, because they are commenced by summons, indictment, or information; and, moreover, they are not civil proceedings. Before the Judicature Act, 1873, only Common Law proceedings were actions. Now the term is properly applied also to proceedings in the Chancery, the Admiralty, and the Probate Divisions of the High Court of Justice, and in County Courts.

Action Française. L'. French newspaper and political group. Founded as a monthly periodical in 1898 at the time of the Dreyfus case, L'Action Française became a daily newspaper in 1908, soon noted no less for its literary brilliance than for its unbridled invective. It supported the restoration of the French monarchy, a return to the old system of provincial administration, the grant of a privileged position to the Roman Catholic Church, and in industry a corporate state on Fascist lines. At the outbreak of the Second Great War L'Action

Française took up a pro-Allied attitude; but after the fall of France in 1940 its attitude changed to one of support for Pétain. With the liberation of 1944, it was suppressed by the De Gaulle provisional govt., along with all other collaborationist periodicals.

Action. Promontory of Acarnania on the coast of ancient Greece. Here, Sept. 2, 31 B.C., the great naval battle took place between the forces of Antony and Cleopatra and those of Octavian, commanded by Agrippa. Antony's defeat left Octavian (Augustus) master of the Roman world.

Act of God. Term used in English law to mean some act or convulsion of nature so extraordinary that it could not be foreseen; or, if foreseen, could not be guarded against. For example, an extraordinarily high tide, a tempest of rare violence, and the like. Act of God is, as a rule, a good defence to an action.

Act of Parliament. Official name for a measure which, having passed through both Houses of Parliament and received the royal assent, has become the law of the land. In Rome records were usually known as *acta*, and the word has been carried from there into many legislatures of the world. The laws of the U.S.A. are called Acts of Congress, and in the Canadian, Australian, and other Parliaments of the British Empire the word act is used.

In the British Parliament, and in those bodies which have modelled their procedure upon it, the word bill is applied to a measure on its introduction, and for it to become an Act the following stages are necessary. It is introduced into one House or the other by one of its promoters, and is read a first time, a formal proceeding only; then comes the second reading, the critical stage when the decisive vote is taken. If approved, the bill is sent either to a committee of the whole House or to a standing committee much smaller in size; there it is examined clause by clause and not infrequently altered. All alterations are reported to the House and, if approved, the bill is read a third time. It is then sent to the other House, where the same procedure is gone through, and finally, having received the royal assent, it becomes an Act.

Such is the usual procedure for public bills, and, with certain modifications, for private ones, but there are exceptions, chiefly

those made by the Parliament Act of 1911. Money bills must originate in the House of Commons, and do not need the approval of the Lords in order to become law. Further, any bill which, under certain conditions, has passed the Commons three times in successive sessions becomes an Act whether the Lords will or no.

In olden times it was the custom for all the Acts passed in a single session of Parliament to form a single statute, and this still survives. The Acts of each session are arranged in chapters, and officially quoted according to the year of the reign in which they are passed; for example, the Act by which King Edward VIII abdicated is cited as 1 Edward VIII, ch. 3. To obviate the inconveniences of this system each Act is given a short title by which it is usually known. The Acts of the English Parliament go back to 1235. The Acts of the Scottish Parliament date from about 1430 to 1707.

Acton (A.S. *ac.* an oak; *tun*, a town or farm). Mun. and parl. bor. of Middlesex, England, 4 m. W. of London (Paddington). A residential and industrial suburb, easily accessible from London by railways and London Transport, it has manufactures of motor parts and accessories, engineering works, printing works, food products, laundries, and many other industries.

In 1922 important extensions were made to the local hospital as the chief part of Acton's war memorial, and further extensions were made in 1928. The town hall, including an assembly hall with a seating capacity of 1,000, was completed in 1939. Acton returns one M.P. Among residents were Richard Baxter and Henry Fielding. Pop. 68,940.

Acton, JOHN EMERICH EDWARD DALBERG, 1ST BARON (1834-1902). British historian and moralist. Born Jan. 10, 1834, at Naples, of an old Roman Catholic family. Acton was the son of Sir John F. E. Acton, 7th Bart., by a German wife. He was educated in Paris, at Oscott

John, Lord Acton,
British historian
Elliott & Fry

under Wiseman, and finally at Munich for six years under Döllinger, with whom, in 1857, he visited Italy. In 1855 he

went to the U.S.A., and in 1856 to the coronation of Alexander II.

In 1858 Acton settled at Aldenham, Shropshire, where he formed his famous library of 59,000 volumes, now in the university of Cambridge. He sat as Liberal M.P. for Carlow, 1859-65, but spoke only once in the House. He was a friend and admirer of Gladstone, by whom, in 1869, he was raised to the peerage. In *The Rambler*, *The Home and Foreign Review*, and other periodicals, Acton consistently endeavoured to widen the view of English Roman Catholics, but his advocacy of the reunion of Christendom and his opposition to papal infallibility were viewed with disfavour at Rome, and the publications were stopped. In 1874 Acton replied in *The Times* to Gladstone's pamphlet on the Vatican Decrees.

Honoured by many universities, Acton was appointed, in 1895, regius professor of modern history at Cambridge and elected honorary fellow of Trinity College. He remained until his final illness in 1901 in full communion with Rome, and died June 9, 1902, at Tegernsee, Bavaria, where he was buried. Lord Acton was a profound scholar and a gifted historian. He planned *The Cambridge Modern History*, but wrote little, and his lectures and contributions to periodicals remained uncollected until after his death. His great library of 59,000 volumes was bought by Andrew Carnegie. Carnegie presented it to Lord Morley, by whom in turn it was presented to the University of Cambridge.

Bibliography. Letters to Mary Gladstone, with memoir by H. Paul, 1904; *Lectures on Modern History*, 1906; *History of Freedom and other Essays*, 1907; *Lectures on the French Revolution*, ed. J. N. Figgis and R. V. Laurence, 1910; *Acton, The Formative Years*, David Mathew, 1945.

Acton, Sir John Francis Edward, 6th Bart. (1736-1811). Prime Minister of Naples under Ferdinand IV. Born at Besançon, France, the son of an English physician, he entered the Tuscan navy. In 1779 he was invited to reorganize the Neapolitan navy, and became successively minister of marine, minister of war, generalissimo of the sea and land forces, minister of finance, and prime minister of Naples. His aggressive policy was highly distasteful to France and led to his downfall. He died at Palermo Aug. 12, 1811.

Acton Burnell. Village of Shropshire, England, 8 m. S.E. of Shrewsbury. In 1283 Edward I, then fighting the Welsh, called a

Parliament here, in which the merchants were separately represented. It passed the statute of Acton Burnell, which made it lawful for a creditor to seize the goods of a man who would not pay his debts, and hold them until he did so.

Actor. One who, on the stage, impersonates and delivers the speeches of a character in a play. Unlike poet or author, the word

actor is still applied only to men. In ancient Greece, where women took part only in the chorus or as flute-players, and the production of plays was organized by the state, actors, as distinct from mimics, called themselves artists of Dionysus, were held in honour, and enjoyed special privileges. They were disguised in mask and buskin. Poets acted in their own plays. In Rome,

where the drama had no national importance, women's parts, except in mimes, were first played by men and boys; actors amassed money and influence—as Clodius Aesopus, in tragedy, and Roscius Gallus, in comedy, both friends of Cicero—but were debarred from citizenship and otherwise penalised by law. They were banished by Tiberius.

In Elizabethan and Jacobean England, actors not licensed after 1571 (14 Eliz. c. 2) were classed as rogues, vagabonds, and sturdy beggars. The more prominent actors were usually partners in the business of a theatre. To two, Heminge and Condell, we owe the first collected edition of Shakespeare's plays; to another, Alleyn, the foundation of Dulwich College. The status of the actor remained more or less under a social cloud until the 19th century; to-day actors form a recognized profession in Britain and have societies, benevolent and other, for their common interests. Towards the end of 1918 an Actors' Association was formed as a trade union, to

Greek mask to intensify actor's voice

Actor. Robert Donat, in his film part of "Mr. Chips," grew old with great artistry. He is seen here first in his eager youth, then in his forties

obtain for all members of the profession a standard contract, to include a minimum wage and payment during rehearsals. *See* Acting; Drama; Equity.

Bibliography. The School of Abuse, S. Gosson, 1579; Apology for Actors, T. Heywood, 1612; *Histrio-Mastix*, W. Prynne, 1633; *Their Majesties' Servants*, J. Doran, 1865.

Actors' Benevolent Fund. Fund established in 1881 to provide for the systematic administration of the money annually given by actors and actresses and others for the relief of distressed members of the theatrical profession. Its offices are at Adam Street, Adelphi, London, W.C.

Actress. Female impersonator of women's parts in stage plays. Originally female rôles were acted by men and boys. Foreign companies which included actresses visited London early in the 17th century, and women of rank figured in Elizabethan and Jacobean court masques and pageants, but actresses, like movable scenery, were first introduced to the English stage at the Restoration, by Killigrew and Davenant, being later popularised by Betterton. Pepys saw actresses first in Jan., 1661, and noted on hearsay that one of Killigrew's productions was acted "by nothing but women." Mrs. Betterton (d. 1712) was the first notable English actress, and Edward Kynaston (d. 1706) the last celebrated English impersonator of female characters. Shakespeare has several allusions to the appearance of men and boys in women's parts, *e.g.* in the epilogue of *As You Like It* and in *Hamlet*, II, 2; and their rivalry enters largely into the famous stage quarrel of 1599-1601. *See* Acting; Drama.

Acts of the Apostles. Fifth book of the N.T., giving the earliest history of the Christian Church. The authorship was attributed by early writers to S. Luke, and this has never been seriously questioned except by F. C. Baur, whose theories are discredited. The author refers to a Gospel written by him; dedicates his work to Theophilus, to whom his Gospel was dedicated; and internal evidence shows that the Acts and the third Gospel were written by the same person. The date was probably about A.D. 65, as S. Paul's arrival in Rome is described, but his martyrdom is not recorded.

The first twelve of the chapters describe the rapid spread of Christianity after the Ascension

of Christ, and deal mainly with the Church in Palestine, with S. Peter as the dominant figure. The remainder of the work consists of a somewhat broken biography of S. Paul and an account of his missionary journeys. In many places in the second part the author writes in the first person plural, showing that he took part in the events; and this intermittent usage is quite consistent with what is known of S. Luke's life and association with S. Paul. The historical character of the Acts of the Apostles is not open to doubt. The references to it by the early Fathers are sufficient proof of its authenticity.

Bibliography. Of the many commentaries on the Acts, those by E. Ziller, Eng. trans. by J. Dare, 1876; R. D. Rackham, 1912; and J. A. Findlay, 1934, may be consulted with advantage.

Actuaries, THE INSTITUTE OF. Founded in 1848 and incorporated in 1884, this professional body exists to protect the interests of actuaries, and to extend and improve the methods of actuarial science. Members are entitled to the letters A.I.A. or F.I.A. The headquarters are at Staple Inn Buildings, Holborn, London, E.C. The Faculty of Actuaries in Scotland has headquarters at 23, St. Andrew's Square, Edinburgh.

Actuary. Word of Roman origin, now mainly used to describe those who work out calculations for insurance companies and similar bodies. The large insurance companies usually have special staffs of actuaries, and they are also employed by Government departments, local authorities, transport undertakings, and building societies. In Rome the *actuarius* was a man who wrote down the *acta* of the senate, and the word was first used in England for a registrar or official of that kind. In 1819 the Friendly Societies Act mentioned an actuary, and with that the present position of the profession may be said to begin. Broadly, the function of the modern actuary is the application to practical problems of the theory of probability. The actuary employed by an insurance company deals with the calculation of premiums payable under new life assurance contracts and the valuation of liabilities under existing contracts, which involves long-term forecasts of the rate of mortality. By training and experience the actuary must be well versed in statistical and financial problems. *See* Insurance.

Acuña, CRISTOBAL (d. 1676). Spanish Jesuit. When working in S. America he explored the Amazon, and wrote a description of it. This was printed in 1640, and is now rare. He died in Peru.

Ada. Town in Bács-Bodrog co., formerly in the kingdom of Hungary, now in Yugoslavia. It is on the right bank of the river Tisza, 34 m. S.E. of Subotica, and is a farming centre in the Alföld. Pop. 13,000.

Ada-Bazar. Industrial town of Turkey. Situated 30 m. E. of Izmid on the river Sakaria, with a station on the Anatolian Rly., it is the see of an Armenian bishop, has silk, linen, and tobacco factories, and exports walnut-wood. Pop. about 20,000 (Christians 8,000).

Adad or HADAD. Storm god in Babylonian and Assyrian mythology. Controller of storm and flood and their consequence, famine, he was a power to be dreaded, or to be invoked for the overcoming of enemies. Under another of his names, Rammon, said to be the Rimmon of the O.T. (2 Kings 5), he is connected with the flood legends.

Adagio (Ital. *ad.*, at; *agio*, ease). Term in music meaning slow and leisurely.

Adair, JOHN (d. c. 1722). Scottish cartographer, appointed by the privy council in Scotland "to survey the shires" in 1683. He made over 20 maps. Specimens of his work are in the National Library of Scotland and the British Museum.

Adal. Former Arab kingdom. Inhabited by warlike, nomadic tribes, it was a Mahomedan state until occupied by France. The region is now included in French Somaliland, being a maritime district of E. Africa, between Eritrea and British Somaliland. It is indented by the Bay of Tajura, an arm of the Gulf of Aden.

Adalbert. Name of two saints. One, of Northumbrian birth, preached in Friesland, Germany, and the Low Countries, and is said to have been archdeacon of Utrecht. He was patron saint of Egmont, in Holland, where an abbey, destroyed by the Spaniards in 1573, was dedicated to him. He died June 25, 705. The other Adalbert, whose original name was Voitech or Voytech, was born about 939 at Prague, of which he became bishop in 983, and where lie his remains. He preached to the Hungarians, Poles and Prussians, and was assassinated by a pagan priest in Pomerania, April 23, 996.

Adalbert (d. 1072). German ecclesiastic. In 1045 he was appointed archbishop of Bremen, and in 1052 papal legate. He was a confidant of the emperor Henry III, and of the young emperor Henry IV. During the absence in Italy of Anno, or Hanno, archbishop of Cologne, Adalbert virtually ruled Germany. In 1066 he was dismissed from the court through the representation of a powerful coalition of nobles, but was recalled in 1069. He was buried in Bremen cathedral.

Adalia. Turkish port on the S. coast of Asia Minor, on the Gulf of Adalia, about 200 m. S.E. of Izmir. Timber, grain, cattle, and horses are exported, but its commercial importance has declined through inadequate harbour facilities. Founded by and named after Attalus II (220-138 B.C.), and known as Satalia to the Crusaders, Adalia, or Attalia, it figures prominently in the medieval history of the Levant. Here Richard I assembled his fleet before the conquest of Cyprus, and the Levant Company had an agency until 1825. Pop. 28,000. The vilayet of which Adalia is the chief town was formerly known by the same name, but is now called Antalya. It was the ancient Tekke. Pop. 256,366.

Adam. Biblical figure, the reputed progenitor of the human race. According to the Creation narrative in the first chapter of Genesis, on the sixth day "God created man in his own image, in the image of God created he him: male and female created he them" (v. 27). In the second chapter a similar account, though with some variations, is given.

"And the Lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life, and man became a living soul" (v. 7).

According to the second narrative Adam was created first and Eve afterwards, because "it is not good that the man should be alone." They were placed in the Garden of Eden and given dominion over the rest of the animal creation. They were allowed to eat of the fruit of all the trees in Eden except the tree of knowledge, which they were forbidden to touch. The serpent, however, tempted them, and Eve succumbed, and afterwards induced her husband to partake of the forbidden fruit. For this act of disobedience they were driven out of Paradise and a curse was laid upon them.

The literal truth of this narrative, long accepted, has been questioned by modern criticism as irreconcilable with the facts of science, especially with 19th century developments in geology and biology. The story itself comes from two sources—the first chapter is taken from the Priestly Code, which dates from the 5th century B.C., the second chapter from the Jahvist document, which is usually assigned to the 8th century B.C. Many modern scholars regard the story as an allegory. Others think the writer is making use of ancient myths as a vehicle for conveying religious truth. On this theory, as Cheyne says, "It is not the mythic basis, but the infused idealism of the Eden story that constitutes its abiding interest for religious men." Similar narratives are found in most

mythologies, and some remarkable parallels have been discovered in the legends of Babylonia, Persia, and even Greece.

Adam Brothers, THE. British architects. Robert Adam (1728-92), the second son of William Adam, a Scottish architect, of Maryburgh, Fife, was the most celebrated of four brothers, John, Robert, James, and William. Born at Kirkcaldy and educated at Edinburgh University, he visited Italy in 1754 and studied the ancient buildings there, particularly the ruins of Diocletian's palace at Spalato (Split) in Dalmatia. Returning to England in 1762, he was appointed architect to George III, but resigned in favour of his brother James in 1768, when he became parliamentary candidate for Kinross-shire. In this year also he began with James to prepare the plans for

Robert Adam,
British architect

building the Adelphi (*q.v.*). The basis of this scheme was the raising of the river shore by a series of arches, on which were to be erected three good streets and a terrace fronting the Thames.

His other best-known works include the fine screen and gateway to the Admiralty building in Whitehall; Lansdowne House, Berkeley Square; Ken Wood House, Hampstead; Syon House, Isleworth; Glasgow Infirmary; the Register House, Edinburgh; Osterley House, Brentford; Harwood House, Yorkshire; Bowood, Wiltshire; Luton Hoo, Bedford-

ADAM. A GREAT MASTER'S CONCEPTION OF THE BIBLE STORY
Ceiling painting by Michelangelo, Sistine Chapel, Rome

shire ; and Kedleston, Derbyshire. He imparted the unity of a single imposing structure to a number of private houses grouped in a block ; this system gave his town architecture great distinction, and his elegant, stucco-faced mansions in the streets of the west end of London were typical examples of his modified Greco-Roman style.

His architecture, however, was more than equalled by his achievements as a decorator of interiors. His ceilings, chimney-pieces, and staircases were designed with a lightness and grace that brought a new note into the application of classicism to domestic buildings, and has influenced interior decoration since his day. He also acquired some reputation as a landscape painter, and published with his brothers a series of engravings of their designs. He died in Albemarle Street, London,

father of the Adam brothers, was king's mason in Edinburgh, and was responsible for the design of the Royal Infirmary in that city, and of Hopetoun House. He died June 24, 1748.

ADAM STYLE. This is the name given to the style of furniture and household decoration first introduced by Robert Adam. It was based on recently found Greco-Roman architectural remains. Despite the introduction of arabesques, sphinxes, and griffins, extravagances were severely toned down. Prominence was given to conventionalized

Adam Style. Salon at Nostell Priory, Yorks., in a wing added by Robert Adam about 1770. The ceiling is in shades of pink, green, and cream. Top right, Boodle's Club, in St. James's Street, London. The lightness and grace so characteristic of an Adam interior are also apparent in this façade
Photo, "Country Life"

March 3, 1792, and was buried in Westminster Abbey.

His brother James was associated in most of the work undertaken by the Adams, particularly in London, during a partnership with Robert that lasted over 25 years. His individual achievements are not known, though Portland Place, London, is said to have been designed by him. He died Oct. 20, 1794. John Adam succeeded to his father's practice as an architect in Edinburgh ; William is reputed to have been a banker and an architect. Their Christian names were long perpetuated by streets in the Adelphi, London. William Adam,

floral, geometrical, and ribbon forms, often combined with the key, wave, fan, honeysuckle, and palm motifs, sometimes used as frames for medallions and panels containing figure or other paintings or designs in line relief. Such panels and medallions on walls, ceilings, and furniture were painted by Angelica Kauffmann, Zucchi, Pergolesi, and others. Colour schemes were subdued in tone, with half-tints prevailing. Furniture and fittings were designed to harmonize with the rooms, so that an Adam drawing-room is distinguishable by its unity.

In furniture, satinwood, amboyna, and various other light

woods were used in combination with mahogany. Everything was light and elegant, with a marked leaning towards straight lines. Legs of chairs and tables were tapered and usually lightly fluted. Carving was reduced to a minimum, reliance being mainly on outline and harmonizing tones. Consult *The Architecture of Robert and James Adam* (2 vols.), A. Baker, 1944.

Adam, JULIETTE (1836-1936). French authoress and publicist. Born Oct. 4, 1836, at Verberie, daughter of Dr. Lamber, she married in 1851 M. Lamassine, a lawyer, and in 1868 M. Edmond Adam, a senator (d. 1877). The leading woman writer in France for over fifty years, she founded a salon described as "the birthplace of the Republic." In 1879 she established *La Nouvelle Revue*, which she edited until 1899 ; under the name of Count Paul Vassili, she also wrote many works of travel, poetry, fiction, plays, criticism, biography, and politics. She did much to promote the Franco-Russian alliance and to keep alive

Juliette Adam,
French writer

the spirit of *revanche* after the defeat of 1870. She died in her hundredth year, Aug. 24, 1936. Consult *Mme. Adam, La Grande Française*, Winifred Stephens, 1917.

Adam de Ros. Anglo-Norman trouvère. Supposedly a member of a Norman family which settled in Yorkshire and Kent. He wrote a poem describing S. Paul's visit to hell with the Archangel Michael as his guide. "In this marvellous poem the whole of the Divina Commedia of Dante is anticipated and displayed" (Rowbotham). The poem is in the Cotton MSS., Vespasian, A.7, in the British Museum. See *The Troubadours and Courts of Love*, J. F. Rowbotham, 1895.

Adam of Bremen (c. 1045-75). German historian. Born in Saxony about 1045, he was a canon and teacher at Bremen from 1069 till his death, Oct. 12, 1075. His fame is based on his *Historia Hammenburgiensis Ecclesiae*, or *Gesta Pontificum Hammenburgiensium*, a history of the see of Hamburg from 784 to the death of Archbishop Adalbert in 1072. Besides containing records of ecclesiastical affairs, the work gives the earliest accounts of the Wends and of other Slavonic tribes, from knowledge gathered by the author during a visit to the Danish court.

Adamant (Gr. *a*, not; *damaein*, to tame). Word applied in the 3rd century B.C. to the emery stone of Naxos, then the hardest known crystalline stone. It was long a synonym for the lode-stone, and among scientists for the diamond. The term adamantine lustre is applied to the high refractive and dispersing properties of the diamond. Adamantine spar is a semi-transparent, light brown corundum, which exhibits the phenomena of asterism or a cluster of stars.

Adamawa. Territory in West Africa situated between Lake Chad and Cameroons. The greater portion lies within the colony taken from Germany in the First Great War, and the remainder, including Yola, the chief town, in Nigeria. The country is mountainous, especially in the south. The soil is extremely fertile, and good crops of cereals, cotton, and vegetables are produced. The palm and banana are extensively grown, and an active trade in ivory and rubber is carried on. See Cameroons.

Adam Bede. Novel by George Eliot, which established her reputation on its publication in 1859. It is a faithful picture of provincial life in the Warwickshire surroundings of her early years, and gives an idea of the tragedy and beauty to be found in the dull routine existence of a rustic population. It

deals with the love of Adam Bede for two women. The character who, according to Leslie Stephen, made the fortune of the book is Mrs. Poyser, the farmer's wife, a creation which stamps George Eliot as a humorist.

Adamello. Mt. of Italy, 11,661 ft. high, in the Lombard Alps. The chief peak of a great glacier region between the Val Camonica, on the W., and the Etschthal, or Adige Valley, on the E., it was first ascended in 1864 by Julius Payer. In April, 1916, Italian Alpini and Austrian troops fought bitterly for possession of the peak. The Italians were successful.

Adami, JOHN GEORGE (1862-1926). British pathologist. Born in Manchester, Jan. 12, 1862, he was educated at Owens College, Manchester, and afterwards at Cambridge and Paris. In 1892 he went to McGill University, Montreal, as professor of pathology and bacteriology. In Canada he took high rank in his profession, being president of the Association of American Physicians in 1911-12. Elected F.R.S. in 1905, he served during the Great War with the Canadian forces in Europe. In 1919 he was appointed vice-chancellor of Liverpool University. He wrote *Principles of Pathology*, 1908, and *The War Story of the Canadian Army Medical Corps*, 1918. He died Aug. 29, 1926.

Adamic, LOUIS (b. 1899). American writer. Born in the then Austrian province of Slovenia in 1899, he served in the U.S. army during the Great War and became a writer. His books include *Dynamite*, 1931, *Laughing in the Jungle*, 1932, *My America*, 1938, *Two-Way Passage* 1941, and *Dinner at the White House*, 1946.

Adamites. Name of several sects who prayed and worshipped in a state of nudity. The first, in Africa, was an obscure Gnostic sect of the 2nd century; another, in Antwerp, belonged to the 12th century; and a third, sometimes called Picards, after their Flemish founder, was exterminated by the Hussite general Ziska in 1421. They professed to revive the original innocence of Adam.

Adamnan, SAINT (624-704). Abbot of Iona. Born at Drumhome, Donegal, brought up in a monastery, and influenced theologically by the Venerable Bede, he became abbot of Iona in 679. The *Latin Life of S. Columba* attributed to him was edited by Dr. W. Reeves for the Irish Archaeological Society in 1857, and this, as translated by Bishop

Forbes of Brechin in 1875, is still considered the standard edition. Adamnan wrote a work on the Holy Places, based on experiences understood to have been communicated to him by Arculphus, a Gallic bishop shipwrecked on the British coast while returning from the Holy Land. He died Sept. 23, 704. See *An Irish Precursor of Dante*, C. S. Boswell, 1908.

Adams. Mt. in the Cascade Range of the Rocky Mountains. It is 12,470 ft. high, and is in the State of Washington overlooking the Columbia river.

Adams, FRANCIS WILLIAM LAUNDERDALE (1862-93). British revolutionary poet. Son of Professor Leith Adams, a Scottish scientist and army surgeon. He was born in Malta, Sept. 27, 1862, and spent his brief, unhappy life in England, Canada, and Australia, beset by physical infirmity and poverty. He was on the staff of *The Sydney Bulletin*, in which many of his verses appeared. He died at Margate, Sept. 4, 1893. Among his works are *Henry and other Tales*; a *Volume of Poems*, 1884; *Australian Essays*, 1886; *Poetical Works*, 1886; *Songs of the Army of the Night*, 1888.

Adams, FRANK DAWSON (1859-1942). Canadian geologist. Born at Montreal, Sept. 17, 1859, he was educated at the High School and McGill University, and afterwards at Yale and Heidelberg. Trained as a geologist, he became a member of the Geological Survey of Canada in 1880, and lecturer in geology at McGill in 1889. In 1894 he was appointed Logan professor of geology and dean of the faculty of applied science. An F.R.S., he wrote much on geology. He died Dec. 27, 1942.

Adams, GEORGE BURTON (1851-1925). American historian. Born at Fairfield, Vermont, June 3, 1851, he graduated at Beloit College, Wis., in 1873, and in due course became professor of history at Yale. He edited the *American Historical Review*, and wrote *Civilization During the Middle Ages*, 1894, *The Growth of the French Nation*, 1896, *European History*, 1899, *Origin of the English Constitution*, 1912, *The British Empire*, 1919, and a *Constitutional History of England*, 1921. He also edited *Select Documents of English Constitutional History*. He died May 26, 1925, at New Haven, Conn.

Adams, JAMES TRUSLOW (1878-1949). American historian. Born at Brooklyn, Oct. 18, 1878, he was educated at Yale and was in

business until 1912, though also engaged in literary work. During the First Great War he served in the intelligence department and helped Col. E. M. House (*q.v.*) to prepare material for the peace conference. His books include *The Founding of New England*, 1921, *Searchlight on America*, 1930, *The Epic of America*, 1931, *The Album of American History* (vol. 1, 1944). He was editor-in-chief of the *Dictionary of American History*, 1941.

Adams, JOHN (1735-1826). The second president of the U.S.A. Born Oct. 30, 1735, at Braintree, later Quincy, Massachusetts, he graduated at Harvard and became a lawyer. An ardent advocate of colonial rights, he protested in 1765 against the enforcement of the Stamp Act and the right of Britain to tax the colonists. As a delegate from Massachusetts, he was a member of the continental congress at Philadelphia in 1776, and proposed that the colonies should henceforward govern themselves. He helped to draft the Declaration of Independence, and was president of the Board of War in Washington's cabinet.

John Adams

As a commissioner from Congress, Adams repeatedly visited France and Holland, and was a member of the body which arranged the treaty of 1783 between Great Britain and the U.S.A. Two years later he was appointed minister to Great Britain, and in 1796 was a candidate for the presidency. He was supported by the Federalists and defeated his opponent, Thomas Jefferson, the Republican candidate. In 1800, however, the two were again candidates, and this time Adams was beaten. He retired to Quincy, where he died July 4, 1826. While in England Adams published his *Defence of the Constitution of the United States*, 1787. *See* Life of John Adams, C. F. Adams, 1871; John Adams, J. T. Morse, 1890.

Adams, JOHN (c. 1760-1829). English seaman, mutineer and settler, whose real name was Alexander Smith. Under the lead of Fletcher Christian he took part in the mutiny on H.M.S. *Bounty*, April, 1789. Of the nine members of the crew who left Tahiti and, with Tahitian wives, settled on Pitcairn Island, he was in 1808 the

sole survivor and head of a prosperous little colony. Unmolested by the authorities, he died in 1829. *See* *Bounty*, Mutiny of the.

Adams, JOHN COUCH (1819-92). British astronomer. Born at Lan-east, near Launceston, Cornwall, June 5, 1819, he is famous for having predicted the existence of, and ultimately discovered, the planet Neptune. While working for the Cambridge trips in 1841, he was struck by the unaccountable anomalies in the motions of Uranus. After graduating as senior wrangler in 1843, he devoted himself to the study of these anomalies, working from the hypothesis that they were derived from a more distant and hitherto unknown planet. By Oct., 1845, he had approximately solved the inverse problem of perturbation on which he had been engaged, and submitted the result of his work to the Astronomer Royal.

Owing to delays in investigation at Greenwich and Cambridge, the credit of priority passed to the French astronomer, Leverrier, who had been engaged upon the same problems and worked out a hypothetical orbit for the disturbing planet. Leverrier's work was completed in the following June, and the planet was found by the German astronomer Galle on Sept. 23, 1846, very near the place assigned to it by Leverrier. It was observed at Cambridge six days later. Adams's name is also associated with investigations into the periodic reappearances of the Leonids, and the determination of 33½ years as their cycle. Adams became professor of astronomy (1858), and was director of the observatory, at Cambridge from 1860 until his death, Jan. 21, 1892.

Adams, JOHN QUINCY (1767-1848). Sixth president of the U.S.A. The son of John Adams, the second president, he was born July 11, 1767, at Quincy, Massachusetts. After studying at Paris, Leyden and Amsterdam, and holding a diplomatic post at St. Petersburg.

J. Q. Adams

he became professor of rhetoric at Harvard. Secretary to the commission which signed the treaty of peace between Great Britain and the U.S.A. in 1783, he was later minister to Holland and Prussia. He was sent by the state of Massachusetts to the

Senate, but resigned through differences with his constituents and became minister to Russia. In 1814 he was one of the negotiators of the treaty with Great Britain which ended the war of 1812, and from 1814 to 1817 he was American minister in London.

Appointed in 1817 secretary of state under President Monroe, he was partly responsible for the purchase of Florida from Spain, and strongly supported the Monroe doctrine. He was a candidate for the presidency in 1824, when none of the four candidates secured the necessary majority. The House of Representatives had therefore to decide, and their choice fell upon Adams. Defeated on offering himself for re-election in 1828, in 1831 he entered the House of Representatives, where he became a keen supporter of the emancipation of the slaves. He died of paralysis, Feb. 23, 1848. *See* John Quincy Adams, J. T. Morse, 1890.

Adams, MAUDE KISKADDEN (b. 1872). American actress. Born at Salt Lake City Nov. 11, 1872, both her parents being on the stage, she made her theatrical

Maude Adams, American actress

début in children's parts. After experience under the management variously of E. A. Sothern, C. Frohman, and John Drew, she made a hit in 1892 in *The Masked Ball*. This was followed by successes as Babbie in *The Little Minister*, 1898; Juliet, 1899; the Duke in *L'Aiglon*, 1900; Miss Phoebe in *Quality Street*, 1902; Peter Pan, 1905; and Rosalind in *As You Like It*, 1910. She played the title rôle in *Chantecler* in 1911, and the principal part in *The Legend of Leonora*, 1913-14. She retired in 1918, but returned to the stage to play Portia, 1931, and Maria in *Twelfth Night*, 1934.

Adams, SARAH FLOWER (1805-48). English poetess. Born at Great Harlow, Essex, Feb. 22, 1805, a daughter of Benjamin Flower, a political writer of radical views, she married William Bridges Adams, an inventor of some importance in the early days of railways. She wrote a number of hymns, of which the best known is *Nearer, my God, to Thee*. She died in August, 1848.

Adams, THOMAS. English divine. A preacher of great eloquence, he flourished between 1612

and 1653, leaving a bulk of printed sermons. These were republished in Nichol's Puritan Divines, 1862.

Adams, WILLIAM (c. 1575-1620). English sailor and the first Englishman to settle in Japan. Born at Gillingham, Kent, and acquainted with the sea from boyhood, Adams went, in 1598, as pilot on board the *Charity*, a Dutch vessel bound for India. The ship lost its way and, after some exciting adventures, the crew found themselves off the coast of Chile. Making their way across the Pacific, they reached Japan in April, 1600, and at Osaka Adams interviewed the ruler of that country, who gave him an income and an estate and kept him in Japan. Adams married and assisted in founding an English settlement on the island of Hirado. He died May 16, 1620. A monument to his memory was unveiled at Yokosuka in 1918. His story is told in the publications of the Hakluyt and Japan Societies. *Consult* Will Adams; The First Englishman in Japan, W. Dalton, 1861.

Adam's Apple (Lat. *Pomum Adami*). Protuberance of the larynx seen in the front of the neck. *See* Larynx.

Adam's Bridge. Chain of rocks and sandbanks, running N.W. to S.E. between Rameswaram Island, off the S. coast of Madras, and Manar Island, off the N.W. coast of Ceylon. At high tide the bridge, which is 17 m. long, is covered by a few feet of water. However, three winding and difficult channels have been dredged, enabling vessels to pass between the Gulf of Manar and Palk Strait. There is some evidence that Ceylon was once connected with the Indian mainland, through which, in 1480, it is said, the sea broke and formed the present bridge.

Adam's Needle. Popular name of the various species of yucca, also known as bear's grass and Spanish bayonet. They are handsome plants belonging to the lily family, and natives of America, from the southern United States to Central America. The long, thick, and mostly rigid sword-shaped leaves are borne in tufts or rosettes, and end

Adam's Needle, a species of yucca

usually in a spine, while the edges often bear slender threads. The large, drooping flowers are borne in a dense panicle several feet in length, and are succeeded by three valved pods. The leaves yield fibres from which cloth and cordage are made.

Adam's Peak. View from Maskeliya of the most celebrated mountain in Ceylon, on the summit of which is the reputed impression of Adam's foot

Adamson, PATRICK (1537-92). Scottish prelate. Born in Perth, during forty years he called himself variously Constayne, Constean, Consteane, Conston, Constant, or Constantine. Educated at St. Andrews University, after serving as minister of Ceres in Fife he went as a tutor in 1566 to France, where he was imprisoned for describing in a Latin poem the son of Mary Queen of Scots as lord of France and England. After hiding for seven months, owing to disturbed political conditions, he returned to Scotland and was appointed minister at Paisley and, in 1576, archbishop of St. Andrews. After a long contest with the Presbyterian party, he was excommunicated in 1586 and in 1588, and died a poor pensioner.

Adamson, WILLIAM (1863-1936). British politician. He began life as a miner in Fife and for 27 years worked in the pits. In 1902 he became assistant secretary of one of the unions of Scottish miners, and in 1908 its general secretary. He was M.P. for W. Fife from 1910 (Dec.) to 1931. In 1917 he was chosen chairman of the Parliamentary Labour Party, and in 1918 was made a member of the Privy Council. He was secretary for Scotland in two Labour administrations, those of 1924 and 1929-31. He died Feb. 23, 1936.

Adam's Peak. Mt. in Ceylon, 7,373 ft. in height. At the summit is an impression in the granite resembling a human foot, 5 ft. long and 2½ ft. broad. According to Arab tradition it was formed by Adam, who stood on one foot at this spot for a period variously

estimated at 200 or 1,000 years, to expiate his crime. The Hindus attribute the mark to Buddha. The mt., which is a place of pilgrimage, is 44 m. E. of Colombo.

Adana. Town of Turkey. The capital of the vilayet of Seyhan, it is on the Seihun Irmak, 42 m. by the Bagdad Rly. N.E. of the port of Mersin and near the Cilician Gates. The river bridge is a restoration of one attributed to Justinian. Wool, cotton, grain, timber, wine, and fruit are exported. Pop. 100,367.

Adaptation (Lat. *ad*, to; *aptare*, to fit). Biological process by which any living organism adjusts itself or is modified to suit the conditions of its existence. In order to survive it must achieve a more or less close adaptation to its surroundings; an obvious example is the dragon-fly whose larva is fitted for life in water while in the insect form its structure is adapted for life on land. Adaptations may be inherent in the germ cell, having probably been fixed by natural selection and transmitted by heredity. In animal evolution certain characteristics may tend to be developed or modified. If they are favourable to the survival of the species, such variations or mutations constitute a process of adaptation. *See* Evolution.

Adar. Twelfth month of the sacred, and 6th month of the civil, year of the Jews, corresponding to Feb.-March. The fast of Esther is observed on the 11th, and the feast of Purim or Lots on the 14th.

Adcock, ARTHUR ST. JOHN (1864-1930). British author and journalist. Born in London, Jan. 17, 1864, and well known as acting editor of *The Bookman*, he wrote more than 30 volumes of verse, fiction, essays, and London literary topography. He died June 9, 1930.

Adda. River of Italy, the ancient Addua. Length about 180 m. It rises in the Rhaetian Alps, flows S.W. through the Val Tellina, between the Rhaetian and Bergamasque Alps, and forms the lake of Como. Issuing thence, it traverses Lombardy and joins the Po 8 m. above Cremona.

Addams, JANE (1860-1935). American sociologist. Born in Cedarville, Illinois, Sept. 6, 1860, the daughter of a Quaker friend of Abraham Lincoln, she was educated at Rockford College, Illinois, and spent two years in Europe, in the course of which she studied conditions of poverty in the east end of London. On her return to the States she became a worker among the poor. In 1889, with Ellen Gates Starr, she helped to found Hull House, a social settlement in Chicago, on the lines of Toynbee Hall, London, and acted as its head resident. She was an ardent feminist and worker for international peace. In 1931 she shared the Nobel peace prize with Dr. N. M. Butler. Her books include *Democracy and Social Ethics*,

Jane Addams,
U.S. sociologist

Consult Life, J. W. Linn, 1935.

Addax (*Addax nasomaculatus*). Genus of African antelope related to the gemsbok. It has fine ringed horns, sometimes nearly a yard long, which twist in an open spiral in both sexes. Found in N. Africa and Arabia, and an animal of the desert, it is a little over 3 ft. in height, has a tuft of hair on the forehead, and develops a fine mane in winter.

Addenbrooke, JOHN (1680-1719). English physician. He was born at Swinford Regis in Staf-

fordshire, and educated at Catherine Hall, Cambridge. The extent of his medical practice is unrecorded, but at his death he left the sum of £4,000 for the founding of "a small physical hospital" in Cambridge. Addenbrooke's Hospital has long been an important adjunct of the medical school of Cambridge, besides being of direct service to the town and neighbourhood. An essay on Freethinking, written by Addenbrooke, was published in 1714.

Adder or **VIPER** (*Vipera berus*). Venomous snake, the only one in Great Britain. The word is really nadder, a nadder being corrupted

Adder. Close view of a large specimen of Britain's one venomous snake

into an adder, as a napron into an apron. It is found in every county in England, Scotland, and Wales, in varying numbers, but, like other snakes, is absent from Ireland. It is the only snake known in Scotland, with the exception of one or two examples of the ring snake in Roxburgh. It is common in some parts of Wales, in S. England, and the N. of Scotland.

The average size of adult vipers in Great Britain is from 20 ins. to 25 ins. A smaller variety, known as the small red viper, averages from 10 ins. to 12 ins. in length. The adder is distinguished by its flattened head, upon which are two dark bands converging in the form of a V. Along the back there is a dark zig-zag line, and along the sides are two rows of dark patches, one on each side. Its food consists of mice, slow-worms or other lizards, young birds, newts, and water-voles.

The females are slightly larger than the males as a rule, less brilliantly coloured, and can be distinguished by their shorter tail, which is much more obviously an appendage than in the male. The upper jaw carries the poison

fangs, about $\frac{1}{2}$ in. in length, pointing backwards into the throat. Their mechanism is that of other members of the same family of serpents. The reproduction is viviparous, the young being born alive, usually ten to thirteen.

The bite of the adder is rarely fatal, except in the cases of young children and persons in ill health. The most important consideration is to prevent the poison from getting into the system. This may be done by instantly ligaturing the affected part, by the tight tying of a piece of string, or by compressing the veins forcibly. The wound should then be strongly sucked until it bleeds profusely. This is quite safe, provided that the lips or tongue are not cracked or sore. Strong ammonia and caustics should be applied to the seat of the injury, or it may be burnt with a red-hot coal. Slightly cutting the place with the point of a pen-knife will assist bleeding. The patient must be kept cheerful. In all cases medical assistance should be obtained at once.

Adder's Tongue Fern (*Ophioglossum vulgatum*). This British fern lacks the typical frond. Each year a single leaf is produced which is divided into

Adder's Tongue,
a pasture fern

two parts: a smooth, leathery, oval blade, 3 ins. or 4 ins. long, and an erect, unbranched spike bearing a double row of capsules which contain the spores. It is much more plentiful than is commonly supposed, growing inconspicuously among grass in damp pastures.

Adding Machine. Name for machine used in mechanical accounting in offices and banks. See *Calculating Machines*.

Addington. Village in Surrey, now included in the county borough of Croydon. Here is Addington palace, built in 1772, a residence of the archbishops of Canterbury from 1808 until 1902. Then remodelled by Norman Shaw, R.A., it later became a country club with a golf course adjoining. Some of the 1,200 acres of the estate were developed for housing. Another Addington is in Kent, 7 m. from Maidstone; in the park are Celtic remains.

Addis Ababa. Capital of Abyssinia. Standing among the Eutoto mts. at an alt. of over 8,000 ft., 225 m. W. by S. of Harar, it consisted until recent years of villages and suburbs grouped round a royal palace, a scattered collection of unimposing buildings enclosed by walls. Founded in 1885, Addis Ababa ("new flower") was made the capital in 1896 by Menelek II, who planted extensive woods of eucalyptus in and around the town. A rly. from Addis Ababa to Jibuti in French Somaliland was completed in 1928. Under Haile Selassie (*q.v.*) parts of the town were considerably modernized, he himself building a new royal palace in the European style. On May 1, 1936, at the climax of the Italo-Abyssinian war, as Badoglio approached Addis Ababa at the head of a mechanized column, Haile Selassie fled from his capital

and dangerous rioting broke out in the streets, resulting in damage by pilage and fire. The rly. station was occupied on May 3 by some 50 French citizens, who defended it with machine-guns. The Italians entered the town on May 5.

During the five years of Italian occupation many imposing buildings of modern European design transformed the appearance of the town, together with broad asphalted streets, Italian shops and cinemas, the premises of Fascist organizations, and new colonial offices. Sanitation, lighting, and other public services were greatly improved. During a Fascist ceremony at Addis Ababa in March, 1937, bombs were thrown, causing injuries to the viceroy, Graziani, as well as to the Archbishop of Addis Ababa. Severe punitive measures were taken officially, some 2,000 arrests being made;

but unofficial reprisals on a large scale were also made by Italian workmen, who massacred a number of inhabitants indiscriminately. Graziani expelled many of those responsible for the massacre.

As Abyssinia was the first country to be liberated of those occupied by Fascist or Nazi forces, so Addis Ababa was the first capital to be liberated. It was recaptured by British and patriot forces on April 7, 1941, and the emperor

Addis Ababa. 1. Air view showing the Gibbi, or Imperial Palace; the domed building on the right is the mausoleum of Menelik II. The new palace is outside the town. 2. Ras Makonnen Street. 3. Modern thoroughfare built under Italian occupation and named Mussolini Street. 4. Parliament House, where the emperor re-opened his parliament on Nov. 2, 1942

re-entered the town in state on May 5, the fifth anniversary of its fall. Pop. about 150,000. See Abyssinia; East African Campaign; Haile Selassie.

Addiscombe. Eccles. district of Surrey, England. It is a residential suburb of Croydon, with a station on the S.R. From 1812 to 1861 the East India Company had a college here for instruction in preparation for the scientific branches of the Indian army.

Addison, CHRISTOPHER, 1ST VISCOUNT (b. 1869). British politician. Born at Hogsthorpe, Lincolnshire, June 19, 1869, he was educated at Harrogate and St. Bartholomew's Hospital, London. He was for a time editor of *The Quarterly Medical Journal*. He entered parliament as Liberal M.P. for Hoxton in 1910, and was appointed parliamentary secretary to the board of Education in 1914, minister of munitions in 1916, and head of a new ministry of reconstruction in 1917. Transferred to the local government board in 1919, he became the first minister of Health that year. This post he resigned in 1921 after his housing scheme had been widely criticized, and became minister without portfolio until he lost his seat in the 1922 election. Joining the Labour party, he was M.P. for Swindon, 1929-31 and 1934-35, serving as minister of Agriculture, 1930-31. Created baron 1937, viscount 1945, and K.G. 1946, he was leader of the house of lords from 1945, Dominion Affairs (later Commonwealth Relations) secretary, 1945-47, becoming lord privy seal in 1947 and paymaster-general in 1948.

Addison, JOSEPH (1672-1719). English essayist, poet, and statesman. Son of Lancelot Addison, who became dean of Lichfield, he was born May 1, 1672, at Milston rectory, near Amesbury, Wiltshire. He went to schools at Amesbury and Lichfield; to the Charterhouse, where his friendship with Steele began, and in 1687 to Oxford, first to Queen's, and then to Magdalen, where he won distinction as a writer of Latin verse, graduated M.A. in 1693, and became a fellow of Magdalen in 1698. The elm-bordered walk by the Cherwell is named Addison's Walk. His earlier efforts in verse included commendatory lines to Dryden, a translation of the Fourth Georgic of Virgil, and a versified Account of the Greatest English Poets.

Through Dryden Addison was introduced to Congreve and Jacob

Tonson, the publisher; and through Congreve to the Whig statesman, Charles Montague, afterwards Lord Halifax, who induced him to abandon the idea of taking orders, and secured for

Jo. Addison
Painting by Kraemer

him a state pension in order that he might qualify by travel for political service. There was at the time keen rivalry between Tories and Whigs to secure young recruits of talent and promise. Leaving England in 1699, Addison spent nearly four years in France, Italy, Austria, Switzerland, Holland, and Germany. In Paris he met Boileau and Malebranche; at a carnival in Venice he saw a crude play on the subject of Cato, which suggested his own play.

When he returned to England at the close of 1703 in straitened circumstances, Tonson introduced him to the Whig coterie known as the Kit-Cat Club, and through Halifax he was commissioned to write a poem in celebration of the victory of Blenheim. This poem, *The Campaign*, 1704, secured for him the succession to John Locke as a commissioner of excise and an under-secretaryship of state. In 1705 he went with Halifax to Hanover. In the same year he published his *Remarks on Several Parts of Italy*. His *Fair Rosamond*, an unsuccessful opera, followed in 1706, and in 1708 he was returned M.P. for Lostwithiel, an election later declared invalid. In 1708 he went as chief secretary to Ireland, where he made many friends, including Swift, and sat in the Irish Parliament as member for Cavan. In 1710 he became M.P. for Malmesbury.

Collaboration with Steele on *The Tatler* led to the foundation by them of *The Spectator*. 1711-14, on his essays in which, and especially his portrait of Sir Roger de Coverley, his literary

fame mainly depends, though his papers in *The Guardian*, *Freeholder*, and *Old Whig* are also noteworthy. His *Cato: a Tragedy*, proved for political reasons a great success in 1713, and in 1714, on Anne's death, he became secretary to the regency. In 1715 he was again in Ireland as chief secretary, and in 1716 was appointed a commissioner for trade and colonies. On Aug. 3, 1716, he married Charlotte countess of Warwick, whose neighbour he was when he occupied Nell Gwyn's old house at Chelsea. From April, 1717, to March, 1718, he was a secretary of state, and he died of asthma and dropsy at Holland House, June 17, 1719, leaving by his marriage with the countess of Warwick (d. 1731) a daughter, Charlotte, who died unmarried in 1797. His last words, addressed to his stepson, were: "See in what peace a Christian can die." He was buried in Westminster Abbey, where a monument to him was erected in 1809.

Politically Addison's integrity was without stain, his temper ever equable; his principles were unchanging. He was popular alike with statesmen and habitués of coffee-house and club. As a writer he helped to found modern English prose and establish a public opinion, while the continuity of his personal studies in *The Spectator* foreshadowed the English novel. Gifted with wit, satire, and insight, he laughed vice out of court and made open violation of decency once for all the mark of a fool. His friendships were many. He had one serious quarrel, fastened upon him by Pope, and a regrettable political difference with Steele, but in neither case did he allow vexation to rob him of good temper. Pope's lines on Atticus, the attack on Cato by John Dennis, and Bernard Mandeville's phrase, "a parson in a tie-wig," were the severest things said of him by contemporaries. His religious sincerity is shown in several hymns, including "When all Thy mercies, O my God."

W. F. Aitken

Bibliography. Works, Bohn, 6 vols., 1856; Lives, W. J. Courthope 1884; Johnson, *Lives of the Poets*; Macaulay, *Essays*; Thackeray's *English Humourists of the Eighteenth Century*

Addison's Disease. Constitutional disease associated with changes in the supra-renal capsules or small glands attached to the kidneys. The most frequent cause is tuberculosis of these glands. The disease begins with symptoms of weakness and

languor, followed by irritability of the stomach, feebleness of the heart, and pigmentation of the skin, which is often the first symptom to attract attention. Death may occur from heart-failure or from development of tuberculosis. Medical treatment may afford relief, but is of little avail to cure the disease, which was named after Dr. Thomas Addison (1793-1860), for many years a physician and lecturer at Guy's hospital, London.

Addition. Process of uniting two or more numbers or symbols in one sum. Simple addition is the adding of numbers, irrespective of the things denoted by them, or the adding of sums of the same denomination. Compound addition in arithmetic is the adding of sums of different denominations, as of pounds, shillings, and pence. This addition of all kinds of multiple quantities or symbols is performed according to the principles of compound addition. Thus, the addition of two algebraic imaginary quantities is effected by adding the real parts of the expressions to obtain the new real part, and the imaginary parts to obtain the new imaginary part.

Additional Forces Act. Act passed by the British Parliament in 1804 to stimulate recruiting. Every parish had to find men or pay a heavy fine. The United Kingdom was divided into districts of such size as would furnish 3,000 men. An infantry regiment was affiliated to each district, and the intention was to feed this regiment from the local levy. County battalions thus raised were for home service, but the men, when trained, were induced by bounties to transfer to the regular regiment, or first battalion. Opposition to compulsion caused the Act to be repealed after Pitt's death in 1806.

Added Parliament. Name given to the Parliament which met in April, 1614, after James I had reigned without one for three years. A number of men called undertakers undertook to induce the members to grant the king the money he needed. But as the members refused any grant until James had surrendered his right to increase certain duties, the Parliament was dissolved in June. It had done nothing, hence its name.

Addlestone. Ecclesiastical district and village in Surrey, England, $1\frac{1}{2}$ m. S.E. of Chertsey by railway. Here are the Princess Mary Village Homes for young girls. Pop. 9,676.

Adorsed OR **ENDORSED** (Lat. *ad*, to; *dorsum*, back). In heraldry, two charges placed back to back. The term is also applied to wings elevated and touching.

Address, FORMS OF. In formally addressing persons of rank or office the following styles are adopted in British usage; *e* standing for address on envelope, *l* for commencement of letter, and *p* for personal address in speech.

ROYALTY. The King: *e.* The King's Most Excellent Majesty; *l.* and *p.* Sire, contracted to Sir. The Queen: *e.* The Queen's Most Excellent Majesty; *l.* and *p.* Madam, contracted in speech to Ma'am. Prince: *e.* His Royal Highness Prince —; *l.* and *p.* Sir. Princess: *e.* Her Royal Highness Princess —; *l.* and *p.* Madam.

NOBILITY. Duke: *e.* His Grace the Duke of —; *l.* My Lord Duke; *p.* Your Grace. Duchess: *e.* Her Grace the Duchess of —; *l.* and *p.* Madam, or Your Grace. Marquess: *e.* The Most Hon. the Marquess of —; *l.* My Lord Marquess; *p.* My Lord. Earl, Viscount, and Baron: *e.* The Rt. Hon. the Earl of —, the Rt. Hon. Viscount —, The Rt. Hon. Lord —; *l.* and *p.* My Lord.

ECCLESIASTICAL. Archbishop: *e.* His Grace the Lord Archbishop of —; *l.* My Lord Archbishop; *p.* Your Grace. The wife of an archbishop or bishop has neither rank nor title, and is plain Mrs. —. Bishop: *e.* The Right Rev. the Lord Bishop of —; *l.* and *p.* My Lord. For a retired bishop: *e.* The Right Rev. Bishop Brown, or whatever the surname may be, and only in personal conversation is the title My Lord retained. Cardinal: *e.* His Eminence Cardinal —; *l.* and *p.* Your Eminence. Archdeacon: *e.* The Venerable the Archdeacon of —; *l.* and *p.* Venerable Sir. Dean: *e.* The Very Rev. the Dean of —; *l.* Very Rev. Sir, or Mr. Dean; *p.* Mr. Dean. (No title on retirement.) Clergymen generally: *e.* The Rev. A. B.; *l.* and *p.* Rev. Sir. In the case of Roman Catholic clergy, it is customary to add Father to Rev.

LEGAL. Lord Chancellor: *e.* The Rt. Hon. the Lord High Chancellor; *l.* and *p.* My Lord. Judge of the High Court: *e.* The Hon. Sir A. B.; *l.* Sir; *p.* My Lord, but in court only. County Court Judge: *e.* His Honour Judge A.; *l.* Sir; *p.* Your Honour, but in court only. Magistrate: *e.* J.P. after the surname; *l.* and *p.* Sir, and Your Worship. Recorder: *e.* The Wor-

shipful (of London the Rt. Worshipful) the Recorder of —; *l.* and *p.* Sir, and Your Worship. Sheriff of London: as Recorder of London.

MUNICIPAL. Lord Mayor: *e.* The Rt. Hon. the Lord Mayor of —; *l.* and *p.* My Lord. Lady Mayoress: *e.* The Rt. Hon. the Lady Mayoress; *l.* and *p.* Madam or My Lady. Lord Provost: *e.* The Rt. Hon. the Lord Provost of —; *l.* and *p.* My Lord. The wife of a Lord Provost has neither rank nor title. Mayor: *e.* The Worshipful the Mayor of —; *l.* and *p.* Sir.

MISCELLANEOUS. Ambassador: *e.* His Excellency — Ambassador to the Court of —; *l.* and *p.* Your Excellency. The wife of an ambassador has no title.

Addressing Machine. Apparatus by which printed or typewritten matter such as names and addresses on envelopes or wrappers, names and details on forms, pay rolls, renewal and receipt notices, municipal demand notes, and many other varieties of listed matter can be printed. The main characteristic is the capacity to print long series of names and facts in desired sequences at speeds up to 5,000 per hour. In one machine, the Addressograph, embossed metal address plates are used which form complete reproducing indexed units. They are printed on hand or electric power ribbon printing machines. In another system, the Elliott, the stencils from which the addressing is done can be prepared on a typewriter. For a works pay sheet, for instance, 250 stencils at a time are printed rapidly on sheets of any length.

Address to the Crown. In Great Britain each session of Parliament is opened by the sovereign or his deputy with a speech. To this both Houses return addresses of thanks, which are usually made the occasion of important debates, especially in the Commons. The form observed in recent years is for two private members to move and second the Address, humbly thanking the sovereign for his gracious speech, and then for the leader of the Opposition to rise and deal with the policy of the Government. The leader of the Government having replied to these remarks, and if necessary defended himself and his colleagues, the debate becomes general. By moving amendments to the Address members are enabled to ventilate real or imaginary grievances, and to bring up questions for discussion. When,

Adelaide. King William Street, the fine thoroughfare which runs through the centre of the city from S. Peter's Cathedral to South Terrace

after a week or more of discussion, the Address is voted, it is taken to the sovereign, who returns thanks to the Lords by the Lord Steward, and to the Commons by the Comptroller of the Household. The two Houses also address the sovereign on occasions of special joy or sorrow, such as a birth or death in the royal circle, an escape from death, or a recovery from illness.

This privilege of addressing the sovereign goes back to the origin of Parliament under Henry III and Edward I, and was for long used in a less formal manner than is the case to-day. In the reign of Elizabeth, for instance, Parliament addressed her, urging her marriage and a settlement of the succession; the Petition of Right was an address to Charles I, and George III was the recipient of others. As, however, power passed from the king to his ministers, this method of drawing attention to grievances became less necessary. See Parliament; King's Speech.

Adelaer OR KURT SIVERTSEN (1622-75). Scandinavian seaman. Norwegian by birth, Sivertsen became a sailor, first in the Dutch navy and then in that of Venice, for whom he fought with distinction against the Turks. In 1654, with a single vessel, he seriously damaged the Turkish fleet in the Dardanelles, and compelled the Turks to surrender at Tenedos. In 1662 he took command of the Danish fleet, retaining this post until his death, Nov. 5, 1675. His name of Adelaer, or the eagle, was given him by the Danes.

Adelaide. Capital of South Australia. It stands near St. Vincent Gulf, 7 m. by rly. S.E. of Port Adelaide. The city, founded in 1836, and named after the queen of William IV, is divided into North and South Adelaide,

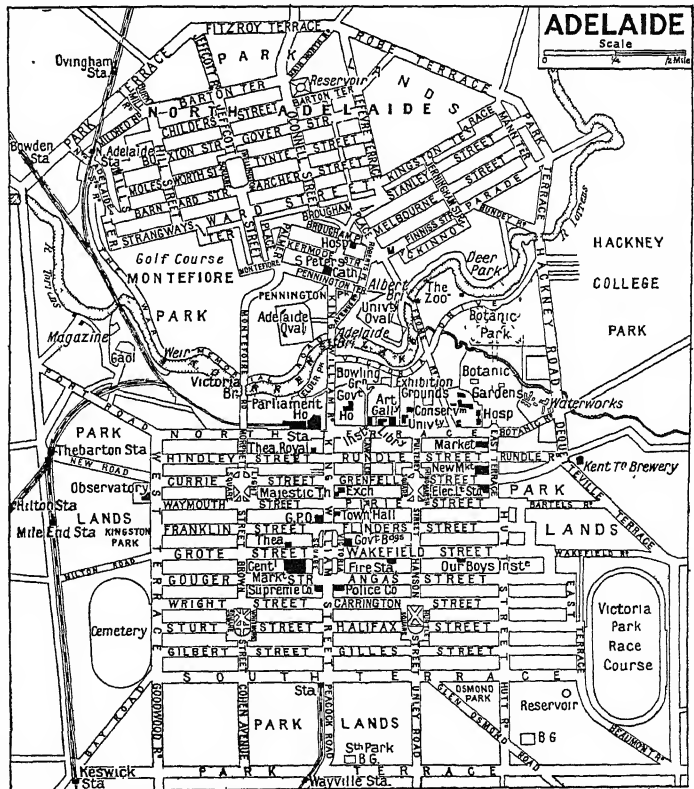

the latter being the commercial portion, by the Torrens river. An important station on the Australian railway system, it is situated on a plain, overlooked on the E. and S. by the Mount Lofty range, which rises between 4 m. and 8 m. beyond the town. The Torrens, crossed here by four bridges, has been converted by a dam into an extensive lake.

On the wide, regular streets,

laid out in a "grid" formation, stand many imposing buildings—the government house, parliament house, town hall, South Australian institute, jubilee exhibition building (1887), and hospital.

Adelaide is the seat of an Anglican and a Roman Catholic bishopric, with cathedrals dedicated respectively to S. Peter and S. Francis Xavier, its chief educational institutions being the university and a school of mines and industries. A number of fine statues includes one of Robert Burns and copies of Canova's Venus and the Farnese Hercules. The Botanic Gardens have an area of 40 acres, and the adjoining Botanic Park and Zoological Gardens are 85 acres in extent.

There are also extensive parks and parklands on the outskirts, forming a green belt one mile broad, the suburbs being built on the far side. At Marble Hill, 12 m. distant, in the Mount Lofty range, is the vice-regal summer residence. Adelaide, which claims to be free of slums, is the

Adelaide. Ground plan of the Queen City of South Australia, which is celebrated for its magnificent situation and its broad and regularly laid-out streets

trade centre of South Australia, its chief exports consisting of wheat, flour, wool, wine, and copper, its manufactures include leather, iron, steel, and woollen goods. Pop 366,000

Adelaide Town of Cape Province, S Africa. It is on the Koonap river, 90 m by rly W N W of King William's Town. Situated in mountainous country, it is a prosperous commercial centre, and holds regular stock fairs. The neighbouring district is noted for merino wool. The Great Winterberg, 6,819 ft., rises 20 m to the N. Pop 9,941

Adelaide, in full AMELIA ADELAIDE LOUISA THERESA CAROLINE (1792-1849) Queen of William IV. The eldest child of George, duke of Saxe-Coburg-Meiningen, she married in 1818 William, duke of Clarence, who in 1830 became king of Great Britain and Ireland as William IV. Her alleged meddling with politics made her very unpopular. After nursing the king in his last

Adelaide

illness her health broke down, and she spent a winter in Malta, where she built the church of St Paul at Valetta. She died at Bentley Priory, near Stanmore, Middlesex, Dec 2, 1849.

Adelaide University. Established in 1874 to serve as the university of South Australia. It has over 1,500 students.

Adelboden. Village and health resort of Switzerland, in the Bernese Oberland. In the canton of Berne, it lies in the Adelboden valley, 10 m by road (diligence) S of Frutigen, on the rly from Thun. It has mineral springs, an old church (1433) and timbered houses. Beautifully situated at an alt of 4,445 ft to 4,595 ft, it commands fine views of the surrounding mountains.

Adeler, MAX (1841-1915) American humorist, whose real name was Charles Heber Clark. Born in Berlin, Maryland, July 11, 1841, he was the son of a clergyman. He is famous as the author of *Out of the Hurly Burly* (1874), the boisterous humour of which made him popular with young people in America and Great Britain. Elbow Room and Ran-

The old Adelphi Terrace, London, before its demolition in 1936. It was modelled on the palace of Diocletian in Dalmatia, and was built by the Adam brothers.

dom Shots are among other works which testify to his command of high spirits and rollicking fun. He died Aug 10, 1915.

Adelie Land. Part of the Antarctic mainland lying approximately in lat 66° 30' S and long 136° to 144° E. It was discovered by Dumont D'Urville in 1840, and was named by him after his wife. The coast was explored by the Australasian expedition of 1911-14.

Adelphi, THE (Gr *adelphoi*, brothers) Name of a locality in London, between the Strand and the Thames Embankment. It was created by the enterprise of the brothers Robert and James Adam, who in 1768 began to reclaim this part of the foreshore of the Thames for building purposes. They obtained parliamentary sanction in 1771 and by con-

structing the Adelphi Aches provided some raised ground on which they built Adelphi Terrace and the streets formerly named after the four Adam brothers (*gr*), James, William, John, and Robert. A wharf and storage room were provided with access from the Strand, and these were completely separated from the fine houses above. The terrace was pulled down in 1936, and was subsequently replaced by commercial buildings of the modern style.

Adelphi Theatre Playhouse in the Strand, London, long the recognized home of melodrama. The comedian, J. B. Buckstone, was a prolific writer of Adelphi drama, e.g. *The Dream at Sea*, *The Green Bushes* and *The Flowers of the Forest*, and William Terriss, murdered in 1897.

The new Adelphi Terrace, erected on the site of the old one (see above), consists of towering office structures in steel and concrete, and during the Second Great War was the headquarters of the Ministry of Supply.

was a popular Adelphi hero. Apart from melodrama, the Adelphi scored an enormous success in 1821 with Tom and Jerry, a version of Pierce Egan's *Life in London* depicting the adventures of Bob Logic, Corinthian Tom, and Jerry Hawthorn.

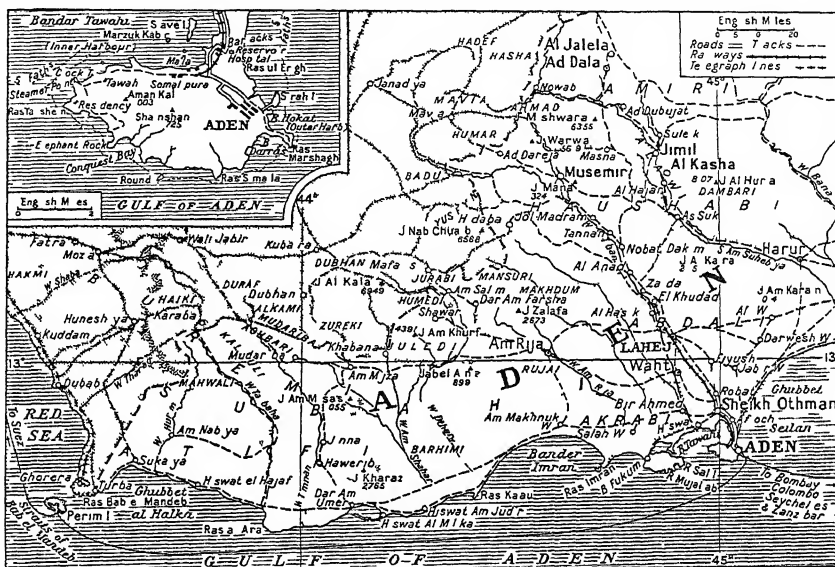

The theatre was built in 1806 by the inventor of "Old True Blue" wasp blue, John Scott, who with his daughter was indefatigable in working for its success. Until 1819 it was called the Sans Pareil. It was rebuilt in 1858, 1901, and 1930. For a few months after the reopening of 1901 it was known as the Century theatre.

Adem, EL
Italian desert outpost in Libya during the Second Great War Situated 18 m S of Tobruk, the site of a large air base, it was abandoned by the Italians in Jan, 1941, as the result of heavy British bombings After the British capture of Tobruk (Jan 22) the burnt out remains of 25 Italian bombers and 43 fighters were found at El Adem Captured by German and Italian forces in April, 1941, it became the scene of intense fighting between the British 8th army and the German Africa Korps in Nov and Dec, 1941 On Dec 9 S African and Indian troops reoccupied El Adem, and were joined there by men from the

Tobruk garrison In June, 1942, the line Tobruk-El Adem south ward, which the British tried to hold, was overrun, and the place remained in German hands until the 8th army's final advance in Cyrenaica, Oct-Nov, 1942

Aden. Town and territory near the entrance to the Red Sea. Built on a volcanic peninsula of

and has two harbours though only the inner harbour on the W side of the peninsula, is of commercial value. On the isthmus connecting Aden with the mainland are four salt works. The isthmus is a sandy flat just above sea level. Pans are excavated in the sand and sea water is let into them through sluices at the spring tides. The

Aden Map of territory surrounding this important fortified British coaling station, with inset map of the peninsula on which the town itself is situated

the same name, 5 m long by 3 m broad, 105 m Γ of the Straits of Bab el Mandeb, the town is an important and strongly fortified coaling station and port of call for P & O and other liners on the seaway to and from India and was given a fresh significance by the construction of the Suez Canal. It is the capital of a settlement named after itself and of the Aden Protectorate, is a cable and wireless station,

water then evaporates. A deposit of about six inches of salt is thus obtained every two months.

The climate is hot, but not unhealthy. Water is scarce and is obtained chiefly from wells near Sheikh Othman, whence it is conducted for about 6 m through a 15 inch main. Practically all food stuffs have to be imported. The settlement has an area of 75 sq m and a pop. of about 80,516.

For many years Aden was administered from India, but since April 1, 1937, it has been a British crown colony. The islands of Perim and Kuria Muria off the Arabian coast, and Sokotra off the African coast form part of the colony, and the small island of Kamaran in the Red Sea, 200 m N of Perim, is also administered under the control of the government of Aden. The Protectorate, area about 112,000 sq m, comprises the region, mainly desert, between the kingdom of Yemen and the dominions of the sultan of Muscat and Oman, with a coastline 750 m long. It includes the Hadhramaut and a large part of the Rub al Khali (Sandy Desert). The popu-

Aden Water-front of Britain's key possession in the Middle East Behind it rise grim, waterless, volcanic hills

lation is estimated at 600,000, subjects of sheikhs in treaty relations with Britain.

The trade of Aden largely consists of transshipment. Oil, coffee, gums, hides, tobacco, grain, sugar, etc., are exported to an annual value of about £4,000,000; cotton and other commodities are imported, to an annual value of about £5,000,000.

Part of *Arabia Felix*, Aden was of considerable importance in Roman times. Unsuccessfully occupied by the Portuguese in 1513, it fell to the Turks in 1538, and was fortified by Solymán the Magnificent. Seized in 1735 by the sultan of Labej it was the object of many struggles until 1839, when it was annexed by Great Britain as a result of numerous outrages on British ships by the sultan and people of the native Arab state of Labej. Perim was occupied by the British in 1857. Sokotra has been a protectorate since 1886. The boundaries of the Aden protectorate, delimited in 1904, were extended by treaties in 1934 and 1938. A command of the R.A.F. was established at Aden in 1928, and during the Second Great War the area became the base for attacks on Italian E. Africa, 1940-41.

Aden, GULF OF. Arm of the Arabian Sea, between Arabia and Somaliland in Africa. Its length is about 500 m. and its greatest breadth about 200 m. It is connected with the Red Sea by the Straits of Bab-el-Mandeb.

Adenauer, KONRAD (b. 1876). German statesman. See N.V.

Adenoids (Gr. *aden*, gland; *eidos*, form). Overgrowth of the lymphoid tissue at the back of the nose, commonest between the ages of three and eighteen. The first effect of adenoids is to hinder or prevent breathing through the nose, and this, in its turn, leads to other and sometimes serious developments. The nose becomes thin and pinched, the mouth is kept open, and the teeth exposed, producing a very characteristic appearance; the palate is high and arched, and the whole chest may become misshapen. The growth may obstruct the Eustachian tubes and lead to deafness, or may set up serious inflammation of the ear. Children suffering from adenoids are frequently irritable and listless and backward at school. Adenoids if left untreated may produce effects often permanent through life, but the growth can be removed by a

surgical operation which is not dangerous, and is almost always satisfactory.

Adenoma. Name given to a tumour or new growth which arises in connexion with secreting glands and, in microscopic structure, simulates the tissue from which it is formed. Adenomata are most frequently found in the breast, prostate gland, kidney, intestine, rectum, skin (in connexion with sebaceous glands), salivary glands, lachrymal glands, nose, pharynx, uterus, and ovary. Sometimes there is a considerable development of fibrous tissue, the tumour then being termed "fibroadenoma." This variety is often found in the breast.

Adenomata are almost invariably non-malignant. Their growth is usually slow. An adenoma may cause no harm or inconvenience, but if it becomes large and begins to press on neighbouring organs, it can as a rule be removed.

Aderno. Town of Sicily, in Catania prov. At the S.W. foot of Mt. Etna, 22 m. by rly. N.W. of Catania, it has a Norman keep and a convent founded by Roger I in 1157. It is the ancient Hadranum, which was famed for its temple of the god Hadranos.

Adherence. Term used in English law. Throughout the British Dominions it is high treason, punishable with death, whether within or without the realm, to adhere to the king's enemies. Such adherence means actively assisting an enemy at war with His Majesty.

Adhesions. Depositions of fibrous tissue, as a response to inflammation or injury, glueing together structures of the body which would otherwise have free range of movement. Adhesions are often found in the lung attaching the pleural membrane to the diaphragm, or in the heart binding the two layers of the pericardium; but the term is perhaps most frequently used to describe bands of fibrous tissue forming in the peritoneal cavity of the abdomen after operation or infection and interfering with the normal movement of the gut. They are a frequent cause of obstruction of the bowel, when they must be severed by the surgeon without delay. If they only cause discomfort and do not endanger life, it is generally wiser to leave adhesive bands unsevered. X-ray examination helps in determining the wisest treatment.

Adiabatic (Gr. *adiabatos*, not passed through). Term used to

denote the state of a gas or any other body, when no heat enters or leaves it. When a gas is compressed it becomes heated, but when pressure is taken off the gas cools. The adiabatic expansion of a gas in a closed space, therefore, implies a fall of its temperature, and this principle is made use of in obtaining very low temperatures. That is to say, when a gas has been cooled to the point at which it liquefies, a still lower temperature can be reached by taking pressure from the gas. The gas then adiabatically expands and its temperature is lowered in the process. The principle is employed in gas turbine engines.

Adiaphora (Gr. things indifferent). Term formerly applied by the Stoics to things on the borderland between good and evil. It became the pivot of a bitter controversy in 16th century Germany, when Charles V, by the Augsburg Interim, 1548, sought to effect a compromise between Protestants and Roman Catholics. The latter refused to regard any of the tenets of their Church as among adiaphora.

Adige. River of Italy, the ancient Athesis. Its length is about 240 m. Rising in Tirol, in the Rhaetian Alps, and flowing past Merano, Bolzano, Trent, Roveredo, Verona, Legnago, and Rovigo, it enters the Adriatic S. of Chioggia. Swift and subject to floods, it is with difficulty navigable upstream as far as Trent. It figured largely in the battles between Italy and Austria, 1915-16, and was crossed by the British 8th army in the final phases of the battle for Italy, April, 1945. *Pron.* Ah-dee-jay.

Adi-Granth. Sacred book of the Sikhs. It embodies the teaching of Nanak (1469-1539), founder of the Sikh religion, as collected by Arjan (1581-1606), fourth of his successors. A second Book was added by Govind Singh (1675-1708) in 1696.

Adipocere (Lat. *adeps*, fat; *cera*, wax). Wax-like substance formed in the process of decomposition of fatty animal matter, particularly in bodies buried in wet soil or immersed in water. In Great Britain adipocere takes from eight to twelve months to form in any quantity, but in hot countries the process is more rapid. When formed, adipocere remains unchanged for an indefinite period. Kegs of butter buried in the marshes in Scotland during the wars of the 17th century have been found completely converted into adipocere.

Adirondack Mountains. A group of mts. situated in the N.E. of the state of New York, U.S.A. Lying between Lake Champlain, E., and the St. Lawrence, W., it forms part of the Appalachian system. The head streams of the Hudson river take their rise in these picturesque mts. Numerous small lakes, many of them over 1,500 ft. above sea level, afford excellent fishing, and there are extensive forests of pine, birch, beech, etc., about 4,000 sq. m. of which have been constituted a state reserve. The region, especially Keene Valley, is a favourite hunting and tourist resort, and several sanatoria are established there for the treatment of lung diseases. There are rich deposits of magnetic iron-ore. The highest summit is Mt. Marcy or Tahawus, 5,385 ft. See Appalachian Mts.

Adit (Lat. *aditus*, entrance). Opening driven into a mine horizontally, not, as a shaft, vertically. Adits are generally driven on a slight up-gradient to allow of a ready flow of water, their principal purpose being for drainage, although they are also used for ventilation. In mining districts very long adits have been driven which serve to drain such districts of water, and effect immense economies in dealing with mine water.

Ancient mining was carried out by adits, probably the oldest method. Both coal and lead were mined in this way. A vertical shaft was often driven to take out the minerals, the horizontal adit being used to remove water and provide ventilation, assisted by fires in the vertical shafts.

Adjamé. Native and original name of the former capital of the Ivory Coast, French West Africa, now known as Binger-ville (q.v.).

Adjective (Latin *adjectus*, thrown to). Word used in grammar to express the qualities of a noun, or to restrict or enlarge its meaning and application. Nouns are often used as adjectives and adjectives as nouns, and probably they were originally used indifferently. In different languages, the adjective sometimes precedes, sometimes follows its noun.

Adjournment (Lat. *ad*, to; *diurnus*, daily; cf. Fr. *jour*, a day). Literally, a postponement to another day. The word is chiefly used in connexion with debates in Parliament and meetings of other public bodies, where it is opposed to dissolution, which

is the end of a meeting. One of the privileges of the House of Commons is that the member who moves the adjournment of the House has the right of opening the debate when resumed.

Adjudication (Lat. *adjudicare*, to adjudge). A term used in bankruptcy law. The court is said to adjudicate or declare a debtor bankrupt when satisfied that there is reason for so doing. See Bankruptcy.

Adjustment (Lat. *ad*, to; *justus*, exact). Term that is used in marine insurance. It means settling the exact amount of money an insured person shall receive for goods lost at sea. Being often a complicated matter, the work has fallen into the hands of a specially trained class of men called adjusters. These have formed themselves into a society, the Average Adjusters' Association, which makes rules for their guidance. See Insurance.

Adjutant (Lat. *adjutare*, to assist). Term formerly employed in ordinary language, but at present only used in the military sense. In the British army an adjutant is a regimental staff officer who is recommended for appointment by the commanding officer of a garrison, regiment, or battalion, or of a training unit, and assists in all details of duty. The appointment is almost always held by a captain, but occasionally by a senior lieutenant who may be promoted to captain on appointment. The adjutant receives and issues orders on behalf of the commanding officer, directs the training of recruits, superintends the work of the orderly-room and general administration of the unit, and is responsible for the upkeep of the regimental books and records.

The adjutant of an artillery regiment has additional duties, as the batteries are frequently distributed at some distance from headquarters. Regimental officers wishing to communicate with the commanding officer do so through the adjutant. An adjutant is appointed for three, or very occasionally six, years, and receives additional pay. When it is desirable the C.O. may appoint a lieutenant as assistant-adjutant, this officer being responsible for assisting the adjutant in training duties.

In the Royal Air Force there are station and squadron adjutants; the former appointment is normally held by a squadron-leader and the latter by a pilot officer or flying officer. Station and squadron adju-

tants are responsible for the general administration of their units.

In peace time officers of the regular army are appointed as adjutants of all auxiliary forces. In foreign armies an adjutant is frequently the equivalent of a British aide-de-camp, while adjutant-general is the equivalent of an aide-de-camp to a royal personage. In the French army an adjutant (*adjutant*) is the equivalent of a British company-sergeant-major, but ranks such as adjutant-major, etc., are conferred on officers holding various administrative appointments. In the U.S. army an officer, usually a captain, is appointed regimental adjutant by the colonel of the regiment, and battalion adjutants, usually lieutenants, are appointed by the battalion commanders.

Adjutant (*Leptoptilus dubius*).

Indian stork of the genus which includes the marabou stork of Africa. It is a large bird, standing nearly 5 ft. high, and the extended wings often measure 15 ft. from tip to tip. Its bald head and the pouch hanging on its breast give it a somewhat repulsive appearance. It is useful in India by reason of its scavenging habits.

Adjutant, a bird of the stork family

Adjutant-General 10 THE FORCES. One of the military members of the British Army Council. Charged with duties pertaining to the army personnel, he raises recruits and is responsible for medical services, education, welfare, prisoners of war, and the registration of graves. Questions of military discipline are referred to him, and he issues orders when the military is needed to aid the civil power. He regulates the flow of drafts to units abroad, and the discharge of time-expired men. On mobilisation he allots units to formations, settles which battalions are to form the brigades, and appoints reserve officers to units. In war an adjutant-general is appointed to the staff of a commander-in-chief, and deputy adjutant-generals, assistant adjutant-generals, and deputy assistant adjutant-generals (D.A.A.G.) to the staffs of commanders of corps and divisions.

Adler, ALFRED (1870-1937). Austrian psychologist. Born in Vienna, Feb. 7, 1870, he graduated M.D. in Vienna in 1885 and practised there 1897-1927, when he was appointed lecturer in psychology at Columbia University, New York. In 1932 he became professor of medical psychology at Long Island College of Medicine. Rejecting Freud's theory of dreams, and with it the basic principles of psycho-analysis, he was the founder of the school of individual psychology, which looks for the origin of neurosis in physical mal-development, leading to the "inferiority complex" and the "masculine protest." In his system the moving force in human life is not sex or love, as Freud maintained, but the will to power. Adler's most important book was *The Practice and Theory of Individual Psychology* (Eng. trans. 1924), and his work is explained in P. Mairé's *A B C of Adler's Psychology*, 1928. Adler died suddenly at Aberdeen, where he was delivering a course of lectures at the University, on May 27, 1937. See *Psycho-Analysis. Consult* Alfred Adler, P. Bottome, 1939.

Adler, HERMANN (1839-1911). Jewish scholar. Born at Hanover, the son of Nathan Marcus Adler he was educated at London University, and in 1863 became principal of the Jews' College in London. Appointed in 1879 assistant to his father, the chief rabbi in the British Empire, he succeeded to that office in 1891. Possessing a liberal and sympathetic outlook on life, he was prominent in most movements for social betterment. He died July 18, 1911.

Adler, NATHAN MARCUS (1803-90). Jewish scholar. Born at Hanover and educated in Germany, he was in turn chief rabbi of Oldenburg and of Hanover. In 1844 he became chief rabbi in London where he promoted union among the various Jewish congregations, and organized Jewish schools. He published a Hebrew commentary on the Pentateuch. He died Jan. 21, 1890.

Adler, VICTOR (1852-1913). Austrian socialist. Born at Prague of Jewish parentage, he became leader of the Austrian Socialist party, which he largely founded. He sat for many years in the Reichsrath, and was foreign minister at the time of his death. Nov. 11, 1918.

Ad libitum. Latin musical term meaning at pleasure, and usually referring to pace. It is also used generally, abbreviated

as *ad lib.*, in the sense of any amount, or to any extent.

Admetus. In Greek legend, son of Pheres, king of Phrae in Thessaly. He took part in the Calydonian boar-hunt and the voyage of the Argonauts. The devotion of his wife, Alcestis, is the subject of a play by Euripides, freely adapted by Browning in *Balaustion's Adventure*. Apollo having obtained from the Fates the promise that Admetus should never die if somebody else consented to die in his stead, Alcestis volunteered to take his place. In Euripides, she is said to have been restored to her husband by Hercules. In another story, Persephonë allowed her to return to earth.

Administration (Lat. *ad*, to; *ministrare*, to serve). Word used to describe men collectively responsible for the government of a country, or for the work, or a section of it, under their control. Thus we speak of a French administration, of a liberal or conservative administration, of the administration of the poor laws, of justice, or of an estate.

Administration, LETTERS OF. Phrase used in English law. When a person dies without a will; or leaves a will but without an executor named therein; or the executor has died before the testator; or the executor is under age, or a lunatic, or for some other reason cannot act; or the executor declines to act, the proper course is for some person to take out letters of administration in the Probate Division, to enable the deceased's property to be dealt with and his debts paid. Until this is done, no one can legally pay anything owing to the deceased, or in any way meddle with his property.

Letters of administration will be granted to the widow, or next of kin, or if none of these wishes to act, then to a creditor. An administrator has to give a bond, with sureties, for an amount generally double the value of the estate, that he will faithfully administer. In the case of an administrator appointed in place of an executor, i.e. where there is a will but no executor, the letters of administration are said to be *cum testamento annexo*, i.e. with the will annexed.

Administration Action. English legal term for an action brought in the Chancery Division to administer the estate of a deceased person. Such an action may be begun by anyone interested in the estate, whether as a trustee, executor, administrator, legatee, heir, or creditor. Commonly it is called putting the estate into

Chancery. An action of this kind is generally brought by beneficiaries who think the trustees or executors are wasting the assets or have been guilty of misconduct; or by creditors who desire to have the estate wound up with the protection of the court.

When the estate does not exceed £500 in value, the action may be brought in the county court, and estates under £1,000, where the persons entitled to the property are of small means, may be administered by the Public Trustee. Instead of ordering administration the court may order the application to stand over for a time to enable the executors or administrators to produce proper accounts.

When an administration order is made, the executor or administrator must obtain permission from the court before dealing with the assets. The court will order the accounts to be prepared and inquiries made. Where an executor or administrator is shown to owe money to the estate, he may be ordered to pay it into court, under penalty of imprisonment up to one year if he fails.

In general, the costs are in the discretion of the court. Where, however, an executor or administrator or trustee has not been guilty of any misconduct he will be entitled to have his costs paid out of the estate.

Administrator. In English law, the person to whom are granted letters of administration to wind up the estate of a deceased person. The order in which the court will grant such letters is (1) next-of-kin; (2) creditors. The next-of-kin rank in the following order of preference. (1) Widow or widower; (2) child; (3) grandchild; (4) great-grandchild; (5) father; (6) mother; (7) brother or sister or their descendants; (8) grandparent; (9) uncle, aunt or their descendants. In default of these the crown is entitled. If a man makes a will, and either appoints no executor, or the executor dies, the Probate court will appoint an "administrator with the will annexed," to wind up the estate and give effect to the will. In this case the residuary legatee is usually appointed, as being the person most interested. Creditor administrators are generally appointed when the deceased has left more debts than estate. When an illegitimate person dies intestate and unmarried, the mother is entitled to all his property; if she is dead, the crown takes it.

Admirable Crichton, THE. Comedy by J. M. (Sir James) Barrie. Produced Nov. 4, 1902, at the Duke of York's Theatre, London, it had a run of 328 performances. The hero, an earl's butler called Crichton, wrecked with his master and other "society" people on an uninhabited island, establishes himself, owing to his strength of character, as head of the community, even becoming engaged to the earl's eldest daughter.

Admiral (Arab. *amir-al-bahr*, commander of the sea). Title borne by naval officers of high

flag at sea he is retired when his turn comes. Vice-admirals are employed in command of important naval bases, battle squadrons and the larger fleets abroad, and must retire at 65 or on completing three years from their last service.

The rank of admiral, also awarded by selection, is the highest in which naval officers are usually employed, and all the principal commands, both afloat and ashore, are generally held by admirals. The age limit is 65, and retirement is enforced after three years' unemployment, or immediately on

Italian *gran ammiraglio* correspond to the British admiral of the fleet. In the U.S. fleet the highest substantive rank is that of rear-admiral, but officers holding important commands are appointed fleet admirals, admirals or vice-admirals for their periods of office.

Admiral Graf Spee. German battleship. Launched in 1934, one of the Deutschland class of 10,000-ton "pocket" battleships, she actually displaced 14,000 tons, had a speed of 26 knots, and carried six 11-in. and eight 6-in. guns. At the outbreak of war in 1939 she preyed on Allied and neutral shipping, and was known to have sunk nine ships, a total of 50,089 tons, all but one in the S. Atlantic. In the battle of the Plate (*g.v.*), fought Dec. 13, 1939, the Graf Spee was so damaged that she fled into Montevideo harbour. From here she steamed out on Dec. 17, only to be scuttled by Hitler's orders in the chief anchorage outside the harbour. Her commander, Capt. Langsdorff, committed suicide on Dec. 20.

Admiral Hipper. German cruiser which gave her name to a class of four heavy cruisers. Completed in 1939, she had an alleged displacement of 10,000 tons, carried eight 8-in. and twelve 4.1 guns, and had a complement of 830. In May, 1945, she was found stranded in Kiel harbour.

Admiral Scheer. German "pocket" battleship with the same tonnage, speed, and armament as her sister ship the Admiral Graf Spee (*v.s.*). Notorious as a commerce raider during the opening months of the Second Great War, and damaged by torpedo in April, 1940, she was sunk in Kiel harbour by R.A.F. bombs on April 9, 1945.

Admiralty, BOARD OF. Governing authority of the British Navy. The Lords of the Admiralty constituting the Board are commissioners appointed by letters patent for executing the duties of a lord high admiral. The office was first put into commission in 1628, and in 1690 a declaratory Act confirmed the powers of the lord high admiral in the Admiralty Board. From 1709 onward, except in 1827-8, when the duke of Clarence was lord high admiral, the office has always remained in commission. The Navy Board, the Commissioners for Victualling, and other bodies, subordinate to the Admiralty, conducted the work of shipbuilding, dockyard work, victualling, etc.; but this divided control, which had led to many difficulties, ended in 1832,

2 D 1

Admiral. Insignia of rank on the shoulder straps and the left sleeve cuffs of the four officers of highest rank in the Royal Navy. Left to right: Admiral of the Fleet, Admiral, Vice-Admiral, Rear-Admiral

rank. Its first use occurs in a convention dated March 8, 1297, wherein William de Leybourne is described as Admiral of the Sea of the King of England. Commonly used to indicate any naval officer senior to a commodore, it is properly applied only to those who stand in seniority between vice-admirals and admirals of the fleet.

In the British Navy a captain selected for promotion becomes a rear-admiral, but may be retired at once if he has not completed the necessary qualifying service, or if the Admiralty do not propose to offer him further employment, the latter including, for this rank, the command of naval establishments and small squadrons, and the subordinate command of larger naval forces. Rear-admirals are compulsorily retired on reaching the age of 60, or on completing two and a half years from their last service. Promotion to vice-admiral is by selection, but if a rear-admiral has not hoisted his

promotion if the officer had not served as a vice-admiral. Advancements to the rank of admiral of the fleet are made by the sovereign's selection, subject to qualifications as to service. Officers of this rank are rarely given employment, but are borne on the active list for life.

Admirals when on active service fly a flag indicative of their rank, whence the term flag officer. The admiral of the fleet's flag is a Union flag, and the admiral's a plain S. George's cross, while vice- and rear-admirals have respectively one and two red balls on the canton or cantons next the staff. Until 1864 the flag ranks below admiral of the fleet were subdivided into those of red, white, and blue squadrons, the rank of Nelson at Trafalgar being vice-admiral of the white.

In nearly all foreign navies the system as regards flag rank is similar to that in the British. The German grand-admiral and the

when the duties of the Navy Board and the other commissioners were transferred to the Lords of the Admiralty, who, under orders in council, became heads of the civil departments.

The First Lord, the minister who is now responsible for the navy to the minister of Defence, presides over the Board of Admiralty, and there is a maximum of 16 members. They include the First Sea Lord, who is also chief of naval staff, the deputy First Sea Lord, the Second Sea Lord (chief of naval personnel), the Third Sea Lord (Controller), the Fourth Sea Lord (chief of supplies and

transport), the Fifth Sea Lord (chief of naval air equipment), the vice-chief of naval staff, the assistant chief of naval staff (trade), the assistant chief of naval staff (weapons), the Parliamentary Secretary, the Civil Lord, the Financial Secretary, the Controller of Merchant Shipbuilding and Repairs, and the Permanent Secretary.

Admiralty, COURT OF. English court of law which existed as a separate entity until 1875, and is now represented by the Probate, Divorce, and Admiralty Division of the High Court of Justice. In the reign of Edward III the various

admirals had certain rights of jurisdiction, courts held in their names being presided over by their deputies. Soon after 1400 there was only one admiral, the lord high admiral, for all England, and consequently only one court. Its duties were to punish crimes committed on the high seas, to decide questions about prizes, and, as trade developed, to settle disputes about contracts, ownership, collisions, salvage, and the like.

Several Acts of Parliament, among them one in 1389 and another two years later, laid down the limits to the growing powers of the Admiralty court, which had

encroached on the domain of the courts of common law, but in the time of James I there were again disputes about the extent of its jurisdiction, and throughout the 17th century its importance waned. But the many battles and skirmishes in which British ships were engaged in the 18th and early 19th centuries resulted in a great renewal of jurisdiction by the court in the matter of prizes. During the Napoleonic wars well over 1,000 prize cases were regularly heard in the course of a single year. In 1841 and 1860 Acts extended its powers but only in civil cases, for since 1834 it had been deprived of criminal jurisdiction. Under the Act of 1873, which reorganized the whole judicial system, this court was united with others to form the Probate, Divorce, and Admiralty Division of the High Court. In time of war the president of this division is appointed president of the Prize Court, which administers the law of nations, as the Court of Admiralty did during the Napoleonic wars. Scotland had an Admiralty court until 1831 and Ireland one until 1877. Vice-admirals' courts, local institutions, existed in England until 1835. They were also set up in most of the British colonies, Jamaica having one in 1662, but nearly all of

Admiralty. Board of Admiralty in session in November, 1939. Reading from the left round the table are: Mr. (later Sir) Geoffrey Shakespeare, Rear-Admiral H. M. Burrough, Vice-Admiral Sir Alexander Ramsay, Rear-Admiral T. S. V. Phillips, Admiral of the Fleet Sir Dudley Pound (then First Sea Lord), Sir J. Sidney Barnes, Mr. Winston Churchill (First Lord of the Admiralty from Sept., 1939, to May, 1940), Sir Archibald Carter, Admiral Sir Charles Little, Rear-Admiral B. A. Fraser, Rear-Admiral G. S. Arbuthnot, and Captain A. V. M. Hudson, M.P.

Admiralty Offices, St. James's Park, London. Surmounted by wireless transmitting and receiving aeriels, they occupy the north side of Horse Guards Parade

them were abolished in 1890, their jurisdiction being transferred to other courts.

Admiralty Arch. Triumphal arch in London. It is at the entrance from Trafalgar Square into St. James's Park, and commands a fine view along the Mall with the Victoria Memorial and Buckingham Palace at the other end. Designed by Sir Aston Webb, it is part of the national memorial to Queen Victoria. It is a triple arch,

troops in Sept., 1914, and have formed part of the Australian mandate of New Guinea since 1920. Japanese forces overran the islands early in 1942, but U.S. forces, landing on Los Negros Is. on Feb. 29, 1944, had cleared the whole area by March 18. The native population in 1940 was 13,450.

Admiralty Unit. Practical unit of electrical capacity adopted by the Admiralty. Also called a jar (from Leyden jar). Equals

to which he has been presented by the patron is performed by the bishop of the diocese, and the clerk cannot enter on the cure of souls without it.

Admittance. Term used in English law. On a change of ownership of a copyhold the new tenant had to be admitted by the lord of the manor, who was always, or nearly always, entitled to a fine for the admittance. This used to take place in a court, attended by the tenants of the manor. The Law of Property Act, 1922, abolished copyhold tenure as from Jan. 1, 1926.

In electricity, admittance is the reciprocal of impedance (*q.v.*), applied particularly to alternating current circuits.

Adobe. Spanish word meaning sun-dried bricks. These bricks are made of mud, chopped straw or similar material being added to prevent cracks in the drying. The word is also used for the earth from which the bricks are formed and any structure made of the material indicated. Slime of this kind of earth serves for mortar.

An adobe structure is formed by embedding dry mud in wet mud. Adobe bricks are found plentifully in prehistoric structures in hot climates. Egypt abounds in them, and in the pre-Aztec remains of Mexico they are sometimes ball-shaped, as if moulded in the palms of the hands. Egyptian mud-bricks of great age were shaped in moulds, and Layard states that their ordinary size was about 12 ins. by 12 ins. by 3½ ins., while some were much larger. Sun-dried bricks attain to great hardness in hot countries, but a serious proposal, made in 1916, that rammed earth (*pisé de terre*) should be used in England for the construction of labourers' cottages ignored the humidity and comparative sunlessness of the British climate. See Brickmaking.

Adolescence (Lat. *adolescere*, to grow up). Term applied generally to the condition or process of growing, and specifically, in human beings, to the period of growth between puberty and the full development of the body. Adolescence extends from about the age of 14 years to 25 in males, and in females from about 12 to 21.

Adonai (Hebrew, My Lord). Term used by the Jews, in reading scripture, wherever the divine name YHVH (Yahveh) or JHVH occurs alone, from fear of guilt under Lev. 24, 16. In the English version of the O.T. Lord is printed in capitals when used to

Admiralty Arch. Floodlit view, from the Mall, of the Arch, erected in 1910. The statue in the foreground is that of Captain Cook

connected by a bridge with the Admiralty offices, hence its name. The Admiralty library is housed in rooms surmounting the arch.

Admiralty Droits. Rights which were at one time the perquisites of the office of the lord high admiral. In 1702 they were surrendered to the Crown, and now form part of the public revenue. All ships, boats, or cargoes, flotsam, jetsam, and lagan, or wrecks and treasure found in the high seas outside territorial waters; all goods and property taken or recaptured from pirates; all royal fishes, such as whales and sturgeons; ships or goods captured from an enemy by a private ship; enemy ships or goods found in British ports or creeks are droits of admiralty. If soldiers from the land capture an enemy ship it is not a prize, but a droit of admiralty.

Admiralty Islands. Group of islands in the Pacific, N. of New Guinea. Part of the Bismarck archipelago, their total area is some 600 sq. m. Manus, the largest, about 55 m. long, is mountainous but fertile. The natives are of Papuan origin. Coconut trees abound, and the pearl fisheries are valuable. Discovered by the Dutch in 1616, and part of a German protectorate in 1885, they were occupied by Australian

one-nine-hundredth of a microfarad. See Capacity; Condenser.

Admission (Lat. *admittere*, to let in). Term used in English law. In civil proceedings it is equivalent to confession in criminal proceedings; i.e. it is a statement made by a party (plaintiff, defendant, pursuer, etc.) to an action or suit, and is always evidence against the party who makes it. All things written by a party are admissions, e.g. entries made by him in books of account: but a verbal admission can be testified to by anyone who heard it made.

An admission may be made by gesture or conduct as well as by words; and an admission made by an agent, while acting in the matter for which he is employed, is evidence against his principal. But an admission made by an agent after his employment has ceased cannot be used against the principal. An admission is generally conclusive against the person who made it, unless he shows that he spoke or wrote under a misapprehension. As a general rule, admissions by a wife are not evidence against a husband, but they will be evidence if she made them while acting as his agent.

In the Church of England the admission of a clerk to the living

represent YHVH, the pronunciation of which is incorrectly represented by the word Jehovah. The Greek and Latin equivalents for YHVH are Kyrios and Dominus.

Adonais. Elegiac poem written by Shelley in 1821. It was occasioned by the death of John Keats, the poet, whose untimely end is likened to that of Adonis.

Adoni. Town of India, in Madras province. It is 64 m by rly. N.E. of Bellary, and manufactures carpets, silk, and cotton goods. Pop. 30,232.

Adonijah. David's fourth son (2 Sam. 3). Born when his father reigned over Judah only, he claimed to be heir-apparent, being supported by Abiathar and Joab, and using similar means to those adopted by Absalom. David, then nearing his end, caused Solomon, who was born when David was king of all Israel, to be anointed and enthroned. Adonijah was pardoned, but, falling under suspicion of reviving his claim, was put to death by command of Solomon (1 Kings 1-2).

Adonis. In Greek mythology, a beautiful youth beloved by Aphrodite. When he was killed by a wild boar, Aphrodite's grief was so great that Zeus allowed him to spend alternately six months among the living and six among the dead. The worship of Adonis, of Phoenician origin and widespread in Mediterranean countries, was in essence the worship of a spirit of vegetation, or more particularly a corn-spirit, the periods of six months referring to the growth of nature in spring and its decay in winter. The gardens of Adonis, which formed part of the festival in his honour, were collections of plants in flower which soon withered. *Consult* Adonis, Attis, Osiris, J. G. Frazer, 1906.

Adoption (Lat. *ad*, to; *optare*, to select). Legalized transfer of the parental rights and duties in respect of a child to some person other than the child's parent or guardian. Until the Adoption of Children Act, 1926, and in Scotland the Adoption of Children (Scotland) Act, 1930, no such transfer was possible in the United Kingdom. These Acts enable such a transfer to take place on an adoption order being made by a Court, and references here to "adoption" are to adoption by such an order. It was, and to a limited extent still is, possible for a person to take a child permanently into his custody, the parents consenting, without any adoption order. But in such cases the father

(or, if the child is illegitimate, the mother) may later reclaim it unless this would be injurious to the child.

Before an adoption order can be made, the parents or guardians of the child must consent, unless their consent is dispensed with by the Court. Any unmarried person under 21 may be adopted. Husband and wife may jointly adopt a child. Unless the adopter is the child's mother, the adopter must be at least 25 years old. The adopter must also be at least 21 years older than the child, except when the adopter and child are within the prohibited degrees of consanguinity or the application is made by husband and wife jointly and the wife is the mother, or the husband is the father, of the child. A male person cannot, except in special circumstances, be the sole adopter of a female.

After a child is adopted, an entry in accordance with the adoption order is made in the adopted children register kept by the registrar-general of births, deaths, and marriages; and a certified copy of this entry may thereafter be used to prove the child's age instead of the usual birth certificate.

This adoption certificate shows that the child is not the natural child of the adopters but does not reveal who its natural parents are. Although full records are kept at the registry they can be inspected only with permission from the Court.

Prevention of Abuses

Provisions have been made to prevent abuses in arranging adoptions and to protect children. All "bodies of persons" (except a local authority) arranging adoptions must be registered as an adoption society with the county or county borough council. When an adoption is arranged by an adoption society, there is a probationary period of three months. During this period the intending adopter may give up the child or the society may remove it. After that time the intending adopter must apply for an adoption order within a further three months or give up the child.

When the intending adopter and the child are brought into touch with one another through some private individual (e.g. a doctor or minister) who is not the parent or guardian or a relation of the child, notice must be given to the local welfare authority seven days before the intending adopter takes possession of the child. This does not apply where the child is

nine years old or more. Child protection visitors may visit the child until it reaches the age of nine or until an adoption order is obtained.

With some minor exceptions, no one except a local authority may receive any payment in connexion with arranging an adoption. It is illegal for anyone to advertise that he or she wishes to have a child adopted or to adopt a child, and only a registered adoption society or a local authority may advertise that they are prepared to arrange adoptions.

The adoption order transfers to the adopter all rights and duties relating to the custody, maintenance, and education of the child. Rights of property are, however, not affected, so that neither adopter nor child acquires any right to succeed to property should the other die intestate. In 1949 a private member's bill was introduced into parliament and welcomed by the government; amendments to the bill included a provision that adopted children should have rights to succeed their adopting parents on intestacy, and a proposal to bring adopted children within the rules of consanguinity. In 1948, 20,000 adoption orders were made.

Adoption was a legal and common practice in ancient Greece and Rome. In Greece a man could adopt a son posthumously by provision in his will.

Adoptionism OR ADOPTIANISM. Heresy that Jesus Christ as man was the Son of God by adoption only. Known in the 2nd century, it was formalised in Spain in the 8th by Archbishop Elipand of Toledo and Bishop Felix of Urgel, who were opposed by Alcuin. It was condemned by the councils of Narbonne, 788, Ratisbon, 792, Frankfurt, 794, Friuli, 796, and Aix-la-Chapelle, 799.

Adoptive Acts. Acts of Parliament which local authorities may or may not adopt at their pleasure. Acts empowering local authorities to establish free libraries, museums, and baths, for example, are usually adoptive, as are some concerning public health; but the present tendency is to make the latter class compulsory. *See* Local Government.

Adoration (Lat. *adorare*, to worship). In a general sense, any act of worship. Roman Catholic theologians recognize three acts of adoration or cultus: latia, the worship due to God alone; hy-perdulia, veneration of the Blessed

Virgin Mary; and dulia, homage to the angels and saints. In art, adoration may mean a representation of the visit of the Magi to the Infant Christ, or a symbolic picture of worship of God in heaven.

Adour. River of France. The ancient Atur, it rises in the Pyrenees and flows over 200 m. N. and W. through Hautes-Pyrénées, Gers, and Landes to the Bay of Biscay below Bayonne. It is navigable for about 80 m., and is in parts canalised.

Adowa OR **ADOA.** Town of Abyssinia. Capital of the prov. of Tigré, it stands 6,270 ft. above sea level, and is the chief centre of trade between the interior of Tigré and the coast. Scene of an Italian military reverse in 1896, the town was captured by the Italians on Oct. 6, 1935, during their conquest of Abyssinia, but was liberated by British forces April 5, 1941. Pop. about 5,000. See Abyssinia; E. Africa Campaign.

Adowa, BATTLE OF. Fought March 1, 1896, between the Italians and the Abyssinians. Anxious to enlarge their African territories, the Italians made a treaty with Menelek, Prince of Shoa, providing him with arms in return for certain concessions. The parties quarrelled. After a success at Coatit, in 1895, an Italian army entered Abyssinia and met with two reverses. Their general, Baratieri, then concentrated his army of about 25,000 men, including 15,000 natives, in a fortified camp in the hills. Hard by were encamped 120,000 Abyssinians, most of them armed with French rifles. Baratieri was prepared to wait in the hope that hunger would compel his foe to move, but being urged to act by the Italian premier Crispi he continued operations.

Dividing his striking force into four brigades, each about 4,000 strong, Baratieri arranged for a night march through the hills. Maps and guides were untrustworthy, spies numerous, and the Italian plans failed. One brigade, the left, took a wrong direction, was attacked by overwhelming numbers and almost annihilated, while another, the right, sent to its succour, after a stubborn engagement was destroyed. The two remaining brigades, with a victorious enemy around them, suffering from thirst and weariness, were ordered to retire. The Italian losses were over 6,000 killed and about 4,000 taken prisoner. The Abyssinians lost between 15,000 and 16,000.

Adramyti OR **EDREMID.** Seaport of Asia Minor in the Turkish vilayet of Balikesir. It stands at the head of the gulf of the same name opposite Mitylene, and 80 m. N. of Ismir. The ancient Adramyttum was close by. Olive trees abound in the vicinity. The Gulf of Adramyti is an arm of the Aegean Sea.

Adrar (Berber, highlands). Name of several large areas in the French and Spanish Sahara. The most important are Adrar Ahnet, Adrar Iforas, Adrar Suttuf, and Adrar Temur. Adrar Ahnet is a district of French Sahara, an elevated region lying S.S.W. of the Hoggar or Ahaggar mountains and bounded on the E. by Ar (Asben) and on the W. by Adrar Iforas. It is extremely barren, and the nomad population consists of Tuaregs.

Adrar Iforas, another district of French Sahara, forms part of a desert plateau lying W. of Ar (Asben) and N.E. of Timbuktu. It is mountainous and practically waterless; the population is mostly nomadic, but there are settlements at Tessalit and Teleyet. From 1903 it was extensively explored by the French government with a view to the construction of a Trans-Saharan railway from Algiers to Timbuktu.

Adrar Suttuf is a region of Rio de Oro, Spanish Africa, in the S.W. of the colony, immediately S. of the Tropic of Capricorn. A mountainous district, yielding salt deposits, it was confirmed in Spanish possession by a boundary treaty with France in 1900. The area is about 2,200 sq. m.

Adrar Temur is an administrative district of Mauretania, French Sahara. Lying to the N.E. of the Senegal river, it is mountainous and arid but with numerous oases. The principal centres of population are Atar, where date palms are found, and Shingeti, where caravans start for St. Louis in Senegal with dates, ostrich feathers, and gold dust. Salt is mined in the Ijl district adjoining Rio de Oro. Other places are Wadan and Ujeft. The mixed population of Berbers, Arabs, Tuaregs, and Negroes is estimated at 10,000. See Rio de Oro; Sahara.

Adrastus. In Greek legend, king of Argos and Sicyon. With six other chiefs, he organized the expedition of the Seven against Thebes to restore the fugitives Tydeus and Polyneices, in which all the leaders perished except himself. Ten years later he led the sons of the fallen heroes, known as Epigoni or descendants,

in a second war, in which Thebes was taken and destroyed.

Adrenalin (Lat. *renes*, the kidneys). Active principle of the supra-renal gland, a small organ attached to the kidneys. It was discovered in 1901, and is a very powerful astringent. It maintains the muscular tone of the arteries and its lack produces Addison's disease (*q.v.*). Injected into the tissues, it causes the smaller blood vessels to contract and so arrests bleeding and reduces local congestion: it is, therefore, effective in hay fever, asthma, and oedema of the larynx. Adrenalin is used in local anaesthetics. During physical effort or excitement adrenalin releases sugar from the liver into the blood, thereby increasing bodily energy. See Endocrine.

Adria. Episc. town of Italy, in Rovigo prov. On the Bianco canal, between the Po and Adige rivers, 26 m. S.W. of Venice, it is built on the site of the once important Etruscan port of Hatria, whence the Adriatic, now some 13½ m. distant, derived its name. Pop. 11,878.

Adrian. Christian name derived probably from the town of Hatria, or Hadria, the modern Adria, in northern Italy. It was borne by six popes, two of whom (III and V) were unimportant. The Roman emperor of this name is usually known as Hadrian (*q.v.*).

Adrian. Roman saint, martyr, and soldier. Converted by witnessing the heroism of some Christian martyrs, Adrian was put to death at Nicomedia, March 4, 303. He is regarded as the patron saint of the soldier, and numerous churches in Flanders are named after him. His festival is kept on Sept. 8. According to legend Adrian's limbs were cut off on an anvil, an emblem which appears on representations of his figure.

Adrian I. Pope 772-95. A Roman by birth, he is chiefly known through his association with Charlemagne. When the king of the Lombards, Desiderius, attacked his possessions, Adrian successfully invoked the aid of the Frankish king, and Desiderius was driven out. Adrian I restored some of the Roman aqueducts.

Adrian II. Pope 867-72. By birth a Roman, he succeeded Nicholas I. He was concerned in the affairs of the Frankish empire, then in a state of decay, but had little authority, and the emperor Louis II was his master.

Adrian IV. Pope 1154-9. Nicholas Breakspear by name, he was the only English pope, being

born at Langley in Hertfordshire. He became a monk in France, and, made abbot of a house near Arles, attracted the attention of Eugenius III, who made him a cardinal. He did good work for the Church in Norway and Sweden, and in 1154 was elected pope. He condemned Arnold of Brescia, and exalted the power of the Papacy. By crowning Frederick I as emperor in 1155, he so displeased the Romans that they drove the two rulers from their city. Returning in 1156, Adrian was involved in a quarrel with Frederick about their respective rights, which occupied him until his death at Anagni, Sept. 1, 1159. Adrian was the pope from whom Henry II asked permission to conquer Ireland.

Adrian VI. Pope 1522-23. Born at Utrecht and known as Adrian of Utrecht or Adrian Dedel, he won repute as a professor at Louvain, and in 1507 was appointed tutor to Charles, afterwards Charles V. For about six years he supervised the working of the Inquisition in Spain, and Leo X made him cardinal in 1517. Chosen pope Jan. 9, 1522, he died Sept. 14, 1523. A man of estimable character, he admitted the necessity of church reform though he declared against Luther. He sought to unite all Christian princes in a league against the advancing Turks, but was forced to join an alliance against France. He was unpopular in Italy because he opposed the Renaissance.

Adrian, EDGAR DOUGLAS (b. 1889). English physiologist. Born Nov. 30, 1889, he was educated at Westminster and Trinity College, Cambridge. In 1925 he was made Oliver-Sharpes lecturer to the Royal College of Surgeons, and his work on the nervous system gained him the

Nobel prize (Medicine), 1932. Adrian was appointed professor of Physiology, Cambridge University, 1937. He was elected F.R.S., 1923, and received the Royal medal, 1934. He was awarded the O.M., 1942.

Adrian de Castello (c. 1460-1521). Italian ecclesiastic. Born at Corneto, he went to England on a mission in the reign of Henry VII, who made him successively bishop of Hereford and of Bath and Wells. He became the confidant of Pope Alexander VI, and was created a cardinal in 1503. For complicity in a plot against Leo X he was deprived of his dignities, fled from Rome, and is believed to have been murdered. He left philosophical and other writings.

Adrianople (Gr. *Adrianopolis*, the city of Hadrian). City of Turkey in Europe. Called Edirne by the Turks, it is on the Maritza at its junction with the Tunja, 137 m. by rly. W.N.W. of Istanbul, and is the capital of the vilayet of Adrianople. In addition to the 16th century mosque of Selim II, a ruined palace, and a Byzantine bridge, it has an immense bazaar, barracks, hospitals, schools, and municipal and military buildings. A commercial centre, exporting silk, wine, tobacco, opium, otto of roses, rosewater, wax, Turkey-red dye, and agricultural produce, it manufactures leather, cotton, woollens, and tapestry. Pop. 46,447.

Originally called Uskudama, and renamed after the Roman emperor Hadrian, who rebuilt and embellished it about A.D. 125, from 1361 to 1453 it was the capital of the Ottoman Empire. Here, after the Russo-Turkish War, was signed the treaty of Sept. 14, 1829. Adrianople was entered by the Russians in 1877-78. and

besieged during the Balkan War of 1912-13. It was ceded to the Balkan allies by the Treaty of London of May 30, 1913, but on the outbreak of hostilities between Bulgaria and her former allies was again occupied by the Turks, to whom it was formally restored, with that portion of the vilayet lying E. of the Maritza river, by the Treaty of Constantinople in Sept., 1913.

Adrianople, THE BATTLE OF. Fought Aug. 9, A.D. 378, near the town of that name, between the Romans and the Goths. The Romans were defeated, and Valens, the eastern emperor, was never seen again. This battle, which led to a settlement of Goths within the frontiers of the Roman empire, was the beginning of that empire's downfall. The success of the Gothic cavalry against the Roman infantry established the superiority of the mounted man in European fighting for a thousand years.

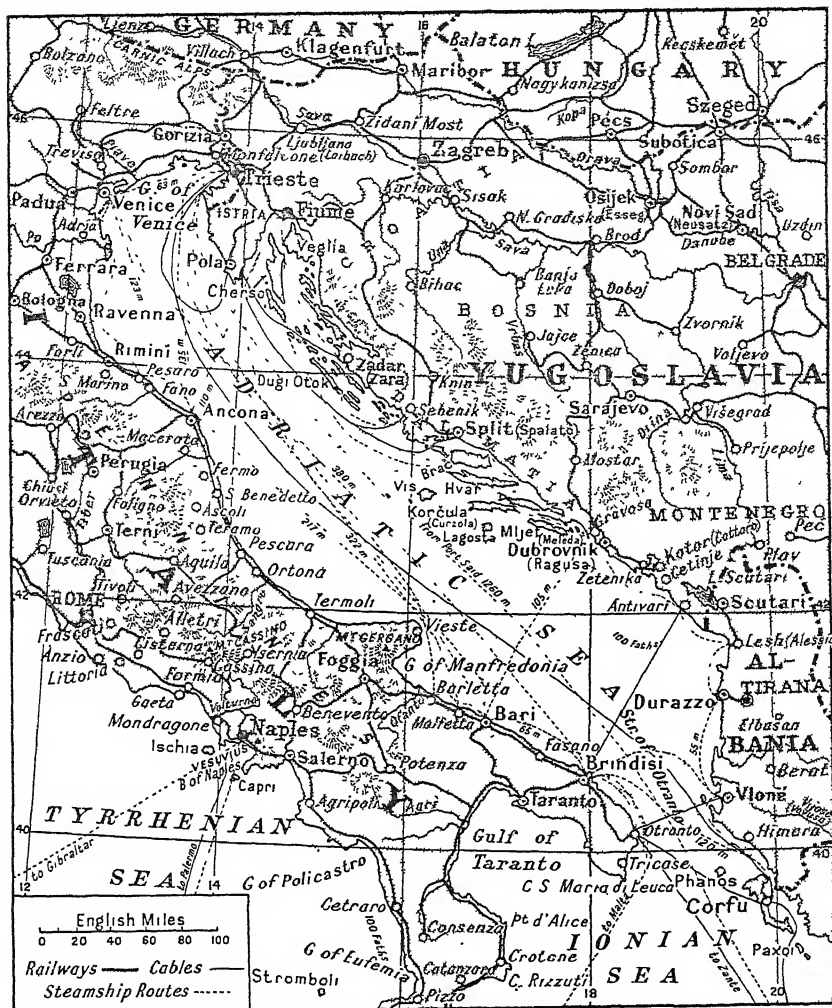

Adrianople, CAPTURE OF. Serbo-Bulgarian success over Turkey, March, 1913. Advancing on Adrianople early in the first Balkan war, the Bulgarians encircled the Turkish garrison there, but were unable to progress farther before the armistice of Dec., 1912. When hostilities reopened in Feb., 1913, Bulgars and Serbs, 100,000 strong, launched an attack on March 24, and the fortress fell on March 26, 39,000 Turkish officers and men and 600 guns being captured. See Balkan Wars.

Adriatic Sea. Arm of the Mediterranean, the ancient *Mare Adriaticum*. Extending N.W. between Italy and the Balkan Peninsula, its length is 470 m., mean breadth 110 m., and area, including islands, about 52,000 sq. m. The W. shore is comparatively low, with few inlets; the E. is steep, rocky, barren, broken, and fringed with islands. Its fisheries give occupation to the seafaring population of the western coasts and islands and from them were recruited sailors for both the Venetian and the Austrian navies.

In the N. the Adriatic has a maximum depth of 25 fathoms. Between Braccia and Ortona it sinks to 100 fathoms, between Monte Gargano and Durazzo it averages 600 and touches 850 fathoms; the mean depth is about 130 fathoms. Its waters are very salt, partly because few large rivers flow into it. Tides are feeble, at Venice rising at most to only 2 ft. A current runs up the E. side and down the W. In

Adrianople, or Edirne. Panoramic view of a flourishing city in European Turkey, the history of which goes back about 2,000 years

Adriatic Sea, which Italian policy between the two Great Wars aimed at converting into an Italian lake by the strategic domination of both shores

colour the Adriatic is greener and darker than the Mediterranean. Its navigation by steamer is easy, but sailors find it dangerous in winter because of sudden gales. It abounds in fish, and sponges are found. Chief ports: Venice, Ancona, Bari, and Brindisi on the W.; Trieste, Pola, Fiume, Zadar, Split, Dubrovnik, Kotor, Durazzo, and Vlone (Valona) on the E.

During the First Great War naval forces of Italy and Austria-Hungary were continuously engaged in the Adriatic, and for a time both sides suffered considerable losses, with the advantage to the Austrians of possessing excellent harbours on the Dalmatian coast. But Italy, assisted by her allies, gradually gained effective control, and in raids on the har-

bours of Trieste and Pola sank or damaged powerful Austrian units. A barrage of submarine nets and mines was maintained across the strait of Otranto, and guarded by British ships.

The Italian landing at Durazzo on April 7, 1939, and the subsequent annexation of Albania, marked a further stage in the attempted fulfilment of Italy's aim of securing the Adriatic as an Italian lake. The Adriatic again became an important area during the Italian campaign against Greece, 1940-41, when Italian supplies were maintained from Bari and Brindisi to Durazzo and Vlone. British warships made a sweep of the Adriatic as far N. as Bari and Durazzo on Dec. 18, 1941. On the capitulation of

Italy in Sept., 1943, and the surrender of her fleet, her Adriatic seaboard was gradually occupied by Allied forces, which captured Rimini Sept. 21, 1944, and entered Trieste May 2, 1945. A British military mission, which reached Albania in April, 1943, began to train an army of Albanian patriots, eventually 20,000 strong, to wage guerilla war against German occupying forces. A British commando force, called Land Forces Adriatic, came into existence in July, 1944, and, in co-operation with the R.A.F. and the R.N., landed in Yugoslavia in Aug. and in Albania in Sept. to assist the guerillas in both countries. The Germans had withdrawn from the Albanian and Yugoslav coasts by the end of the year. For fighting on the Adriatic sector of the Italian front, see Italy: Campaign in. See also Trieste.

Adshead, STANLEY DAVENPORT (1868-1946). British architect. Born in Manchester, he devoted special attention to town-planning, and was professor of town-planning at Liverpool University, 1909-14, and at London University, 1914-35. His works include Ramsgate and Worthing pavilions, and the rebuilding of the duchy of Cornwall estate, Kennington, 1913-14. He wrote *Town-Planning and Town Development*, 1923; *A New England*, 1942. Adshead died April 11, 1946.

Adsorption (Lat. *ad*, to; *sorbere*, to suck up). Term meaning absorption at the surface of a solid body. In a crystal of common salt, NaCl, there is, except at the surface, a regular arrangement of the atoms of chlorine and sodium; each

chlorine atom is attracted by, or combined with, six chlorine atoms; at the surface, however, each chlorine atom is attracted by five sodium atoms and each sodium atom by five chlorine atoms. There is accordingly a reserve of attraction possessed by every atom on the surface which makes the surface more active chemically than the interior. A similar state of things is found in many solids and liquids. A surface of the metal palladium attracts, and is possibly in a state of weak combination with, the gas hydrogen; one volume of palladium in a fine state of division adsorbs about 500 volumes of hydrogen. Charcoal, which is mainly carbon, contains many tiny holes and passages and therefore has a very large number of surfaces. Coconut charcoal and charcoal specially prepared to have plenty of such surfaces are known as activated charcoal. They are largely used to adsorb, or collect, gases, vapours, and liquids that are undesirable or commercially valuable. Special charcoals are used in gas masks, for the recovery of benzene and other volatile oily compounds from town's gas, or to remove fusel oil from whisky. Adsorption plays an important part in dyeing certain fibres and fabrics. Not only are the original surface atoms specially active; the adsorbed atoms and molecules may also be very active. This is the basis of many catalytic action processes used in industry. *See* Absorption; Catalysis.

Adular. Natural potassium aluminium silicate. A variety of potash-felspar or orthoclase, it is usually transparent, but a translucent variety is used as a gemstone under the name of moonstone. The name is taken from Mt. Adula in Switzerland. *See* Orthoclase.

Adullamites. Name given in derision to those members of the Liberal Party, forty or so in number, who, in 1886, left their colleagues rather than agree to Earl Russell's proposals for parliamentary reform. The most prominent of these was Robert Lowe, afterwards Viscount Sherbrooke, and their defection led to the resignation of Russell's ministry. The name was due to John Bright, who likened the dissentients to the distressed, the debtors, and the discontented, who flocked to David in the cave of Adullam (1 Sam. 22).

Adult (Lat. *adultus*, grown up). In English law, a person 21 years old or over. Under that age a person is an infant or minor, and

is subject to legal disabilities. An infant becomes an adult the day before the 21st birthday.

Adult School. Institution for social, educational, and religious work, originally organized and supported by the Society of Friends. These schools exist throughout the United Kingdom, and recent statistics showed a total of about 1,000 schools and nearly 20,000 members. The movement has extended to Australia, New Zealand, Canada, and the U.S.A.

Many schools meet on Sunday mornings. In the 19th century illiterate members were taught reading and writing. This teaching was followed by a meeting, with prayer and singing, and an address. The school then divided into sections for the study of the Bible. The basis of the school is the practical teaching of Jesus Christ. The aim is to help the members to discover and practise the art of living. Broad cultural subjects of a varied nature are now studied, with the aid of an annual lesson handbook. Associated with the schools are libraries, savings banks, study circles, lectures, and social evenings, technical classes, social clubs, sick benefit, coal, book, and athletic clubs. Members are of both sexes, generally over 17 or 18 years of age, and each school is governed by the members themselves. The schools are united in the council of the National Adult School Union, with headquarters at 30, Bloomsbury St., London, W.C.1.

Adulteration (Lat. *adulterare*, to corrupt). Term meaning the debasement of anything by the substitution for one or more of its ingredients of something inferior. It is usually applied to food and drugs.

Pliny in the first century A.D. mentions frauds by bakers who added a soft white earth to bread; in ancient Athens adulteration of wine led to the appointment of an official to stop the practice. Dr. Wynter Blyth has collected instances of severe punishments inflicted during the Middle Ages upon fraudulent vendors of foods. Bakers, brewers, vintners, and "pepperers" were frequent offenders, and were punished by being set in the stocks, whipped, branded, or turned out of the town. A wine-seller condemned to drink six quarts of his own wine died from the effects.

Although adulteration of food is fairly widespread in Great Britain, the devices of dishonest

traders are becoming increasingly difficult to practise undetected.

The report of the Ministry of Health for 1937-38 showed that of 144,675 samples of food examined in England and Wales in 1937, 8,061 were adulterated or not up to the legal standard. Milk is a food easily adulterated by the addition of water, or by adding to pure milk the separated milk remaining after the cream has been removed, by adding condensed milk, gelatin, starch, preservatives, and colouring matter. The extent of milk adulteration varies widely, figures from 2.5 per cent to 35 per cent having been reported. Penalties for this type of offence range from a caution to substantial fines.

Adulteration of food and drugs takes many forms, e.g. coffee containing chicory; gelatin with excess of arsenic; margarine with too much preservative; self-raising flour yielding insufficient carbon dioxide; chemical food short of iron; olive oil containing cheaper oils; senna pods containing grit; too much sulphur in sulphur ointment. During recent years the vigilance exercised over foodstuffs has made the more impudent types of fraud by gross adulteration much more difficult.

Adulteration was the subject of incidental legislation during the reigns of Henry VIII, Mary, Anne, the four Georges, and William IV, and in more recent times gave rise to the series of statutes known as the Sale of Food and Drugs Acts, 1875 to 1927, finally merged into the Adulteration Act, 1928. The law relating to adulteration has since been consolidated into one comprehensive code. This embodies all the public health statutes dealing with the importation, preparation, storage, sale, and delivery of food, the examination and seizure of unsound food, the notification of food poisoning, and the control of markets, slaughter-houses, and cold-air stores. This Act is called the Food and Drugs Act of 1938. During the Second Great War, however, the sale of food was rigorously controlled by regulations and orders, enforcement being carried out by the Ministry of Food. On the other hand, some of the laws affecting foods were relaxed, e.g. some preservatives forbidden before the war were permitted. The shortage of supplies of some articles in common use produced during the war an increasing number of exaggerated and unjustified claims

for certain food substitutes, and the provisions of the law designed for the protection of consumers against false and misleading advertisements and labels for food were strengthened. The Food and Drugs Act prohibits the addition of any substance to any food so as to render it injurious to health or the addition to any drug of any substance that affects the quality or potency injuriously; no article so mixed may be sold. The Act forbids the sale to the prejudice of the purchaser of any food or drug which is not of the nature, substance, or quality demanded. A purchaser cannot be prejudiced, however, if clear notice is given at the time of sale that the article sold is not of the nature, substance, or quality demanded.

The Act also provides for the appointment of public analysts. Authorised officers who purchase samples for analysis are called "sampling officers." The sampling officer, after purchasing a sample for analysis, must inform the seller of his intention to have it analysed, and must then and there divide the sample into three parts, each of which is then marked, sealed, or fastened up, one part being delivered to the seller, one being taken for analysis, and one being retained for future comparison and production in court if necessary. It is characteristic of the wiles of dishonest traders that in order to defeat these measures they will sell only genuine articles to a stranger, lest he be a sampling officer, and will continue to do so until they are satisfied that he is an ordinary regular customer, when they will supply adulterated articles time after time. Any person refusing to sell to a sampling officer renders himself liable to a fine of £5.

Bibliography. Foods, their Composition and Analysis, Wynter Blyth, 7th ed., 1927; Bell's Sale of Food and Drugs, 11th ed., 1943; Ministry of Health Annual Reports.

Adultery (Lat. *ad*, to; *alter*, other). Unfaithfulness to the marriage vow, or sexual connexion by a husband or wife with someone other than the lawful spouse. Legally, adultery is committed where these conditions obtain, however innocent the adulterer may be morally—e.g. where a woman erroneously believes her husband to be dead. It is not a crime; but it is an ecclesiastical offence, and for that reason a clergyman can bring an action of slander for

being spoken of as having committed adultery, but no other man can. By the Slander of Women Act, 1891, a woman can sue for verbal allegations against her chastity. In English law, adultery by either husband or wife constitutes ground for divorce, though adultery by a husband was made so only as late as 1923. See Divorce.

Adur. River of Sussex, England. About 20 m. in length and navigable for sailing barges, it enters the English Channel at Shoreham. It is a recognizable river at West Grinstead, where are ruins of the Saxon Knepp Castle, and it passes Bramber, which has remains of a Norman castle and church.

Ad valorem (Lat. according to value). Phrase used in the U.S.A. in connexion with duties on the value of imported goods, and in the United Kingdom with those on stocks and shares. See Tariff and Stamp Duties.

Advanced Air Striking Force. Detached elements of the Royal Air Force operating in France in the opening phase of the Second Great War, under the command of Air Marshal Sir Patrick Playfair. Based near Reims, it was equipped with Hawker Hurricane fighters, Fairey Battle and Bristol Blenheim bombers, and Westland Lysander army cooperation monoplane. Photographic reconnaissance work included photographs of the entire Siegfried line. Pilots of this force took part in the earliest combats between Hurricane and Messerschmitt 109 fighters.

Advancement. In English law, the gift by a parent or person *in loco parentis* for the purpose of advancing a child in life. For example, money given to a son to buy a partnership, and also money or property settled on a daughter on marriage, are advancements. Money spent on education, or a mere present on a festive occasion, is not.

Advancement of Learning, THE. Philosophical work by Francis Bacon, first published in 1605. Its object was to survey the whole field of human knowledge, and note such "omissions and deficiencies" as should be made good by learned men. Bacon divided human learning into history, poetry, and philosophy, corresponding to memory, imagination, and reason, as the principal faculties of the mind, and then subdivided these parts. He advocated the use of induction as a means of increasing scientific knowledge. In 1623 the work was

issued in a Latin translation, with considerable additions, as *De Augmentis Scientiarum*.

Advent (Lat. *adventus*, coming). In the eccles. year of the western churches, the four weeks immediately preceding Christmas, reckoned from the Sunday nearest to S. Andrew's Day. Beginning the church year, this season is observed as one of solemn preparation for Christmas and for the second Advent or Parousia (Matt. 24-5). According to one hypothesis, this second Advent is past and judgement is proceeding. The early Church kept a 40 days' fast before Christmas. The words *O Sapientia* in the calendar (Dec. 16) open a Latin anthem still sung in R.C. churches during Advent.

Adventists. Name of several sects, mainly of American origin. The Second Adventists, founded in 1831 by William Miller (1781-1849), believe in the imminence of the second Advent, and have repeatedly assigned dates for it. Seventh Day Adventists date from 1844, believe the second Advent imminent, but do not date the event, and observe the seventh day of the week as the Bible Sabbath. They emphasise temperance and promulgate rules of health.

Adventurers. In general, men who go forth in search of something vague or unknown. In English history the term is applied to those who, in the time of Elizabeth, went out to seek wealth in Muscovy, Cathay, or the Indies by plundering the Spaniards, or in other ways; to those who bought and settled on the land in Ireland confiscated after the rebellion of 1641; and to those who, in the 17th and 18th centuries, drained the fenlands of East Anglia.

Adverb (Lat. *ad*, to; *verbum*, word, verb). Indeclinable part of speech added to verbs, adjectives, and other adverbs to define their meaning more closely. Adverbs are divided into those of place (here, there), time (now, then), quantity (more, less), manner (well, ill), and others. They were originally cases of nouns.

Advertisement Duty. Tax on advertisements in force in the United Kingdom from 1712-1853. It was a stamp duty charged on all advertisements in newspapers at the rate of 3s. 6d. for each paragraph. In 1833 it was 1s. 6d. in Great Britain and 1s. in Ireland, and in 1853 it was abolished. In 1830 it produced £170,000, of which The Times paid £70,000.

ADVERTISING: ITS METHODS AND PURPOSE

C. HAROLD VERNON, President, 1945-46, Incorporated Institute of Practitioners in Advertising

This article describes how a highly developed and essentially modern art, which seeks to combine information with persuasion, maintains its position as a force in the social and economic life of the community. See also the articles on Newspaper; Poster; Printing; Trade Marks, etc.

The word "advertising" is derived from the 14th century English *averte*, meaning "to turn towards" or "to draw attention to," and the "d" was inserted to distinguish it from the Latin *avertere*, meaning "to turn away."

Although advertising in Great Britain dates in an elementary form from the 17th century, its development as a specialised technique of persuasion is of relatively modern origin. The first advertisements were merely announcements, usually relating to books and pamphlets which were about to be published, theatrical productions, sermons; and for more than a century little change occurred in their form of appeal.

In the second half of the 18th century the wood-engravers began to develop a form of decorative advertisement as trade cards. Many of these were very beautiful pieces of work. Hogarth was responsible for a number of them. From this time onwards advertising began to receive recognition as an essential business force, and consequently, as competition became keener, advertising became more ingenious and enterprising. The industrial revolution of the 19th century created a bigger demand and a much wider distribution of goods and manufactures.

Merchants and manufacturers began to "brand" their products to distinguish them from those of their competitors. It was necessary to make the public familiar with these brands, and the result was a considerable increase in the employment of press advertising and other forms of publicity. Progress was, however, slow and the majority of advertisements remained crude and elementary. Their creators displayed no great taste, imagination, or artistic ability, and no great respect for the truth. Often the advertiser relied solely on the mere repetition of his name and gave no reasons why his commodity was better than another.

It was not until the early years of the present century that advertising came to be regarded as a business requiring intelligence, perception, and artistic ability. But before that period a few men of foresight had already begun to devote their attention to the subject. As competition became more intense, advertisers had ventured outside their own office staffs to find new talent. There is the outstanding example of Pears' Soap, whose manufacturers purchased Sir John Millais' Royal Academy picture-of-the-year, "Bubbles," to illustrate a poster. Advertising gradually became "respectable." It was soon found that to be successful it must conform to certain fixed principles: it must be informative, it must make an appeal to one or more of the emotions—hope, love, self-respect, pity, snobbery, generosity, ambition, sense of humour—and it must be firmly rooted in truth. Furthermore it must be designed to interest and convince the particular social group which it seeks to influence.

A new and important factor made itself felt in advertisement production—the advertising agent. Originally the advertising agent had operated almost entirely as a canvasser of advertisements for the newspapers, from whom he

received a commission upon the business which he obtained. Now he began to function as an adviser. He became a *practitioner* in advertising. Soon it was realized that the advertising agency was to occupy a key position in the business world. Acute and educated minds were gradually attracted to the agencies as writers, designers, artists, statisticians and psychologists, and in many other expert capacities. Today the advertising agency has become a highly skilled creative unit without which few advertisers would wish to operate.

A Social Force

Advertising has become such a potent social force that it is employed upon tasks of wide variety. It is used not only by manufacturers and merchants, retail stores and mail order houses, but also by Government departments, political parties, and organizers of charitable appeals. Nation-wide advertising campaigns have been built round such slogans as "Eat More Fruit."

Present-day advertising may be divided into seven major subsections: press advertising, outdoor advertising, display, printed matter, postal advertising, film, and radio advertising. These are used collectively or individually, as circumstances demand, but the advertiser usually supports his main campaign by at least one other medium.

PRESS ADVERTISING. This comprises the advertisements which appear in the daily, evening, and weekly newspapers, the magazines and journals, and the trade and technical periodicals. Press advertisements account for by far the greatest volume of advertising expenditure, and the reason for this is not difficult to see. No other method makes it possible for an advertiser to put a written message before many millions of potential customers in a few hours. Several of the national newspapers have circulations exceeding two million copies per issue, and rates are naturally high.

If an advertiser is to obtain the best return for his money, he must have a clear conception of the people who read the papers in which he places his advertising. To this end, independent surveys are periodically made, as many

Pears' soap.

Two years ago I used Pears' Soap. Since then I have used no other!

Advertising. This famous "Punch" joke-drawing by Harry Furniss was first used as an advertisement in 1885

as 50,000 people being interviewed to obtain a true cross-section of the reading tendencies of the British public. From an analysis of these surveys it is possible to discover the exact composition of the readers of each individual publication, their sex, their ages, and their purchasing capacities, based upon earnings. An advertiser, having found by market research in what group of the community he is likely to find his customers, then selects a list of publications that will reach the correct group with the least possible wastage of circulation.

Most advertisers use the medium of the press. Out of a total of £30,000,000 estimated to have been spent in 1938, advertisers of food and drink accounted for 18 per cent, household supplies for 13 per cent, medicines for 11 per cent, wearing apparel for 11 per cent, motoring and travel for 10 per cent, toilet articles for 10 per cent, and cigarettes and tobacco for 6 per cent. Other big users of newspaper advertisements are the department stores.

Press advertising is essential where the advertising contains a news message which must be speedily conveyed to the public or where a quick response is required. The newspapers are specially effective for this type of advertising because of their frequency of publication and their

widespread circulation. Magazines and periodicals, on the other hand, particularly those which devote themselves to special interests, offer the advertiser an opportunity of reaching clearly defined groups of people, such as housewives, motorists, professional classes, fashion-conscious women; and they have the added advantage of a considerably longer "life" than newspapers.

OUTDOOR ADVERTISING. This category embraces posters on hoardings, railway stations, vans, bus sides; enamel iron plates; showcards in trains, buses, and tramcars; sandwich boards; electric and neon signs; skywriting and banners towed by aeroplanes. (See Poster.)

Poster advertising on outdoor sites does not lend itself to the conveyance of long or detailed messages. It is, therefore, regarded as "reminder" advertising. The advertiser tells his story in full in the press, and by means of outdoor advertising he drives home repeatedly a short message which is the essence of the press campaign. An experienced advertiser is careful to see that there is a link between his press advertising and his outdoor advertising, in the form of either a slogan or a style of illustration; so that the reader

displays are usually passed on from one retailer to another so that their life may be as remunerative as possible.

CATALOGUES, FOLDERS, AND LEAFLETS. The success of this method of advertising depends largely upon the mode of distribution. The advertiser who keeps his printed matter until it is asked for by a potential buyer is ensuring against waste, but severely restricting his advertising opportunity. On the other hand, indiscriminate distribution of leaflets by door-to-door or hand-out methods can be costly and wasteful of material. The best results are usually obtained when the advertiser's printed material is offered in press or radio announcements, or alternatively by distributing the material direct to people who are known to be likely customers.

POSTAL ADVERTISING. Apart from the distribution of printed matter such as is described above, postal advertising can take the form of a circular letter unaccompanied by any other enclosure, or even a postcard. Direct mail advertising is most profitable when it is circulated to specially compiled lists of prospective respondents. These may be people who have already shown interest in the advertiser's proposition, e.g. by an earlier purchase, or, in the case of advertising by local traders, those whose geographical position makes them likely customers.

Postal advertising can also be profitable to advertisers selling to definite and known sections of the community, such as engineers, builders, architects, lawyers, doctors, and nurses. Organizers of charitable appeals, who make frequent use of the post, generally address their messages to people who are

Rowland's Macassar Oil

has been for 100 years recognized as the best and safest preserver and beautifier of the hair, and is far preferable to other hair restorers which are really poisonous dyes, and deposit a sediment on the scalp which fills up the pores. It promotes and beautifies the hair, arrests baldness, removes dandruff, and is the best restorative for the whiskers and moustaches, and being most beautifully perfumed, is a perfect toilet luxury for everyone. Also sold in a golden colour for fair-haired ladies and children.

Bottles, 2s. 6d., 7s., 10s. 6d.

Advertising. Typical example of the simple kind of advertisement found in 19th century newspapers

of the newspaper advertisement, on seeing the poster or sign or showcard, is quickly reminded of the full message which he has read previously.

DISPLAY. In late years display has reached a very high state of efficiency, and specially trained men and women are employed on this work. The big stores employ their own display staffs, who devise original and artistic displays for their windows and interiors. The big manufacturer, selling through many outlets, has displays manufactured and distributed to the shops. Elaborate

already known to have been contributors to similar appeals.

FLM ADVERTISING. Many cinema proprietors allot a certain period of time during each programme to the showing not only of advertisements on lantern slides but of advertising films, and advertisers have been quick to seize this opportunity to convey their message graphically to a very large public. The danger to be avoided in this form of advertising is resentment on the part of the audience, who, having paid for admittance, may feel that they are having an advertisement

foisted upon them in place of the entertainment for which they have paid. Therefore great care is taken by advertisers in the production of these films to ensure that they do provide entertainment, sometimes in a humorous manner and sometimes by virtue of their technical or topical interest. During the Second Great War the various government departments took full advantage of film advertising.

RADIO ADVERTISING. The development of radio advertising, so marked a feature of American life, has been complicated in the U.K. by the restriction placed upon the B.B.C. in the matter of sponsored programmes or the selling of "time" on the air for commercial purposes. This led to the opening of advertising concessions from foreign stations easily heard in this country, whereby British advertisers were able to broadcast programmes in English. Leading variety artists were attracted to these programmes by the generous fees paid by advertisers, and at the outbreak of war in 1939 it was estimated that at least five million listeners in the United Kingdom were in the habit of tuning in to advertising programmes from Luxembourg, Fécamp, etc. (See Broadcasting.)

Like the poster, radio advertising is limited in the opportunity it offers for telling a detailed story. The listener will not tolerate an excess of sales talk, and this means that radio is often used as "reminder" advertising in support of other media.

PLANNING THE CAMPAIGN. The intending advertiser, having assured himself that he is in a position to meet the increased demand which he hopes to create, must next determine the amount of money which can profitably be devoted to the campaign. In this matter the advertising agency is usually able to give good advice. One of the first decisions must be the form of appeal. How far shall it be informative, and how far persuasive? Shall the persuasive appeal be mainly to the emotions, or to reason, or to both? The agency then prepares preliminary rough designs, or "visuals," of the advertisements, posters, showcards, cartons, etc., and the text, or "copy," is written. Then comes a conference with the advertiser before proceeding to finished art work, photographs, and typesetting. Simultaneously the agency will have prepared the detailed estimate of cost,

divided into the various forms of advertising which are to be employed.

After approval, the agency makes itself responsible for booking space in the press, arranging contracts with the billposters, and negotiating and supervising the printing or other media to be employed. A schedule is prepared showing the publication dates of the advertisements. When the advertisements begin to appear in the press or on the hoardings, they are carefully watched and checked by the agency, which also checks the accounts before passing the charge to the advertiser. As the campaign progresses, the advertising agency seeks information from the advertiser regarding the results obtained. Such information is weighed and analysed and, where necessary, the advertising is adjusted to make it more effective.

ORGANIZATION AND CONTROL. Much is being done by the organization of advertising interests to strengthen and improve the value of advertising both to the public and to those who employ it as an implement of business. The Advertising Association and the Newspaper Proprietors' Association both have vigilance committees which maintain a careful watch upon press advertising claims generally. This assists in the elimination from the newspaper columns of advertisements of undesirable products, as well as keeping within bounds those claims made on behalf of reputable merchandise. A similar censorship of poster claims is maintained by a joint committee operated by the British Poster Advertising Association and the London Poster Advertising Association. These associations also concern themselves with the selection of poster sites, with a view to the protection of public amenities. Standards of practice among advertising agents are the concern of the Institute of Incorporated Practitioners in Advertising, which includes nearly all the reputable agencies in its membership.

These efforts have been materially supported by Government legislation. In 1944 the Ministry of Food took over from the Ministry of Health those provisions of the Food and Drugs Act which forbid false or misleading claims on labels or advertisements. The Labelling of Food Order, 1944, re-enacted those provisions, and in addition imposed a strict measure of control

upon the claims of vitamin and mineral value. The Order also required disclosure of ingredients in manufactured foodstuffs under a wide range of headings.

THE SECOND GREAT WAR. The outbreak of war in 1939 instantly reduced the volume of commercial advertising to a mere trickle. Advertisers were uncertain how the impact of war would affect their supplies and trading, and although a revival after a month or so of hostilities had shown that the declaration was not to be followed by a cataclysm of the life of the community, the growing shortage of paper reduced the opportunity to advertise, and publishers were compelled to impose rigorous restrictions on the amount of space which could be allotted to any one advertiser.

Government Advertising

To aggravate the situation further, a new competitor entered the field with a growing demand for more and more advertising space—the Government—which for obvious reasons was granted priority.

The Ministry of Information grew almost overnight from a small nucleus to a great organization with a major section devoted to the preparation and control of most of the Government appeals and directions. Posters appeared on the hoardings carrying such slogans as "Freedom is in peril, defend it with all your might" and "Your courage, your devotion, your resolution, will bring us Victory." The National Savings Committee intensified its efforts to encourage war savings and check private expenditure, the Ministry of Home Security publicised Air Raid Precautions, the Service Ministries stimulated recruitment, and the Ministry of Food turned to advertising in all its forms for help to safeguard the nation's larder and to give valuable advice to housewives on the best use of rations.

At first the advertising essays of the Government mainly took the form of exhortations. But it was soon found that the nation was in no need of any such elementary stimulant; and taking several leaves out of the commercial advertisers' book, Ministries began to reason and explain. A notable example of this "adult" advertising was the Ministry of Food's weekly issue of an advertisement under the title "Food Facts." This contained the latest Ministry of Food news. It told the nation

how to register with retailers; periodically it told them how to get their ration books; it introduced the points system; it stimulated the consumption of potatoes when supplies were abundant; it encouraged economy when potatoes were scarce; it broadcast many hundreds of recipes to make dull menus brighter. Its imaginative conception took such a hold on the people that a vast correspondence grew out of it, and housewives all over the country collected the advertisements every week so that they could refer to them when occasion arose. "Food Facts" first appeared in July, 1940, and continued weekly throughout the war. (See National Savings.)

The shortage of newsprint called for heavy reductions in the size of newspapers and periodicals. Daily newspapers which had run to 24 and even 32 pages had to compress news and advertising into four pages, and commercial advertisers had to be content with smaller spaces. However, as all advertisers except the Government were subject to the same restrictions, no one advertiser was able to overshadow others merely by virtue of magnitude; and typographers, designers, and writers had to rely upon talent to secure the attention they desired. This task was made easier by the fact that few advertisers had any need to stimulate sales, so continued to advertise principally to maintain the goodwill which they had created before the war and to keep names green in the public memory.

Outdoor advertising came almost to a standstill. The paper shortage impelled the Ministry of Supply to issue restrictive orders concerning the printing and displaying of posters relating to the sale of goods. These restrictions, of course, did not affect the Government, who, apart from a few advertisers who had stocks of posters printed before the war, soon became the only exhibitors of posters on the hoardings.

Film advertising was affected by restricted supplies of film stock and processing capacity,

MINISTRY OF FOOD

THE WEEK'S

FOOD

FACTS N°1

There will be more advertisements in this series. It will be well worth your while to collect them. As each appears, pin it up in your kitchen.

GROW fit not fat on your war diet!

Make full use of the fruit and vegetables in season. Cut out "extras"; cut out waste; don't eat more than you need. You'll save yourself money, you'll save valuable cargo space which is needed for munitions, and you'll feel fitter than you ever felt before.

ON THE KITCHEN FRONT

Advertising. The first of the Ministry of Food's regular exhortations during the Second Great War. Austerity recipes and hints on kitchen economy were appended

and commercial advertising films almost disappeared. Here again, however, the Government took advantage of its privileged position. Apart from a number of five-minute films made by the Ministry of Information, there were occasional full-length feature films dramatising the war stories of the various Services. At the other end of the scale came the weekly "flashes" produced by the Ministry of Food, and other "flashes" produced by the National Savings Committee and the Ministry of Fuel and Power. The cinema exhibitors patriotically gave screen time free of charge to these Government films.

Radio advertising, already limited to stations outside the United Kingdom, disappeared with the German occupation of the Continent. Illuminated signs were extinguished by the blackout. Catalogues, booklets, showcards, and printed displays practically disappeared owing to the scarcity of paper and cardboard.

It was left, therefore, for newspapers and periodicals to be the mainstay of the advertiser, whether Governmental or private, and they

performed their task ably and fairly. Advertising played an important part in the life of the nation at war; the morale of the home front was supported and the goodwill of the nation's traders protected by the intelligent and courageous use of the printed word.

Advocate (Lat. *ad*, to; *vocare*, to call). Term common to all members of the legal profession when representing a client before any court or tribunal. In England and Ireland barristers can appear anywhere. Solicitors cannot appear in the House of Lords, Privy Council, Court of Appeal, or the High Court; nor at a quarter sessions except where there is no Bar.

The relations between an advocate and his client are absolutely confidential, and not even a court of law can compel the disclosure of any communication between them. The advocate, in conducting a case, can make admissions that bind his client, but he cannot compromise the case without the client's permission; short of this, however, he can refer to arbitration, or otherwise do what he thinks in his client's interests. The utterances of an advocate in conducting a case are absolutely privileged. The only restraints imposed are by the influence of the judge and of the general opinion of his professional brethren; and in a criminal prosecution, if he is prosecuting, by the rule that a prosecuting counsel must regard himself as a minister of justice. An advocate's duty is to do his best for his client, regardless of the consequences to anybody else, provided he fights "with the sword of the soldier, and not with the dagger of the assassin."

The word was first used by the Romans, and until 1857 had a distinctive use in England. Until then it was given to those who practised in the ecclesiastical courts, men who were licensed to do so by the archbishops, and formed a separate legal college. This was swept away when ordinary barristers began to practise in these courts.

In Scotland the word advocate is still used in a narrower and more definite sense. There the advocate is a member of the higher branch of the legal profession, the equivalent of the English barrister. To become an advocate one must pass certain examinations and pay certain fees, arranged and controlled by the Faculty of Advocates. The examinations are first in general subjects and afterwards in law. In France also the

word, under the form *avocat*, is used in practically the same sense as in Scotland, both having borrowed it from Roman Law.

Advocates, FACULTY OF. Corporation which controls admission to the Scottish Bar. All advocates must be members of the faculty, as only those who are can plead before the Court of Session. It dates from 1532, when a College of Justice was founded in Scotland. The head of the faculty is a dean, elected annually; he, with the other officials, makes regulations for the examination of intending advocates. Its headquarters are at Parliament Square, Edinburgh. The great library of the Faculty of Advocates, founded in 1682 and containing many valuable MSS. relating to the history of Scotland, became the National Library of Scotland in 1925. See Libraries.

Adwoson (Lat. *advocatio*, legal aid, patronage). Right of presenting to an ecclesiastical living—e.g. a rectory or vicarage. It is a form of heritable property. It may be attached (appendant) to other property, as where the lord of the manor of X has the right to present the rector of the parish of X; or it may exist as a right independent of other property. The owner of the adwoson is called the patron of the living. An adwoson, unless attached to other property, may not be sold after two vacancies have occurred in the benefice subsequent to July 14, 1924. The Diocesan Board of Patronage has certain rights to purchase compulsorily any rights of patronage offered for sale. The patron has the right to prevent the incumbent from wasting church property. Where an adwoson is held in trust for X, the presentation is made by the trustees, but X nominates the person to be presented. A patron must not take money for presenting a clergyman to the living.

Adye, SIR JOHN MILLER (1819-1900). British soldier. Born at Sevenoaks, Kent, Nov. 1, 1819, Adye became an artillery officer, and went through the Crimean War and the Indian Mutiny. He held administrative posts in the Indian

and British Armies, and in 1882 went to Egypt as chief of the staff to Wolseley. He was made a G.C.B., was governor of Gibraltar 1883-6, and died Aug. 26, 1900. Adye wrote several books on military subjects. *Pron.* ad'y.

Adytum (Gr. *a*, not; *dyein*, to enter). Term anciently used to denote an inner sanctuary. For instance, it was the part of a temple which only the priests were allowed to enter, and where oracles were delivered.

"A. E." Pen-name of the Irish poet, George William Russell (*q.v.*).

Aecus. In Greek legend, son of Zeus by the nymph Aegina, and king of the island named after her. The father of Telamon and Peleus, he was renowned for his integrity and justice, and after his death, with Minos and Rhadamanthus, was made by Pluto one of the judges of the underworld.

Aedile (Lat. *aedes*, a building). Roman magistrate. In republican times the chief duties of the aediles were the superintendence of public buildings and of the water supply, direction of the police, provisioning of the city, management of public games, and care of the public archives. Instituted 494 B.C., they were at first two in number, both plebeians; but in 366 two more, called curule, from being privileged to sit in a curule chair (*q.v.*), were appointed. The curule aediles were at first patricians. Under the Empire their functions were greatly curtailed, and the office itself disappeared before the time of Constantine. *Pron.* ē'dil.

Aedui or **HAEDUI.** Celtic tribe, living between the Loire and the Saône. They were the first Gallic people to join the Romans, and were treated with special regard by Caesar, who defended them against external foes.

Aeetes. In Greek legend, king of Colchis, in Asia Minor, and possessor of the Golden Fleece. Jason and his Argonauts were assisted in their search for it by the daughter of Aeetes, Medea. See Golden Fleece; Jason.

Aegades Islands (anc. *Aegates*; Ital. *Egadi*). Three mountainous islands, Favignana, Maritimo, and Levanzo, off the W. coast of Sicily. They were the scene in 241 B.C. of the defeat of the Carthaginian fleet by the Romans under Gaius Lutatius Catulus. Goat rearing and tunny fishing are the chief industries. Pop. 7,000.

Aegaeon. In Greek mythology, an alternative name for Briareus. He was one of the giants who assisted Zeus against the Titans.

Aegean Civilization. Name given to the pre-Hellenic civilization, including the Minoan, Cycladic, and Mycenaean cultures. Its chief centres were Cnossus and Phaestus in Crete, the islands of Melos, Paros, and Naxos in the Cyclades, and Mycenae and Tiryns in Peloponnesus.

Crete was the first European land to attain high achievement in art. The term Minoan has been given to phases of Bronze Age civilization there, subdivided into three periods: Early (c. 3600-2100 B.C.), Middle (c. 2100-1600), and Late (c. 1600-1200). The golden age of Crete—in the Late Minoan period—lasted about a century (c. 1500-1400), towards the end of which the island was invaded by the Mycenaeans, and the palace at Cnossus burnt.

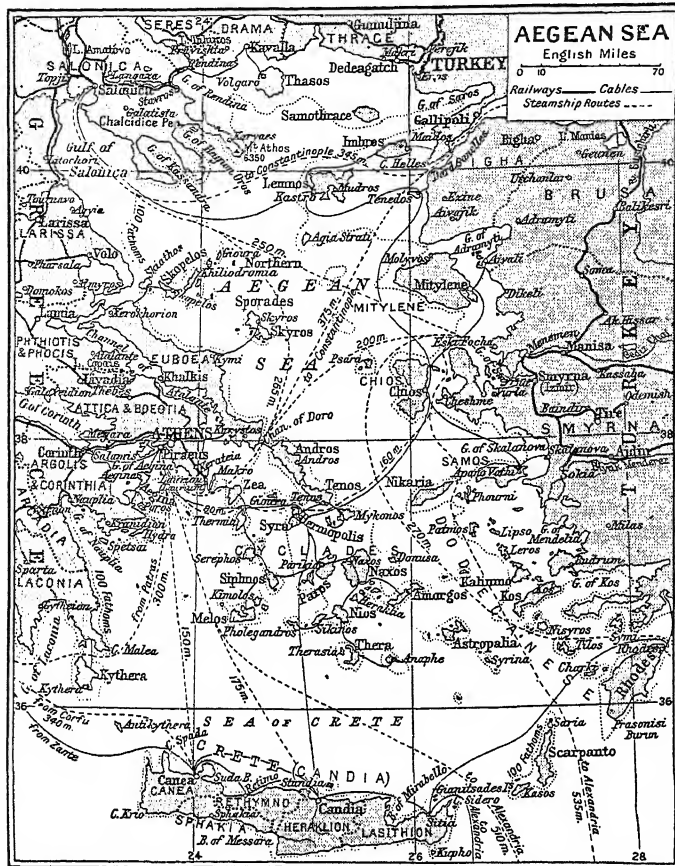

The Mycenaean culture was an offshoot of the great Cretan civilization. The evidence suggests that it was the result of conquest. There was no gradual Minoisation of the native community on the Greek mainland, but an abrupt and wholesale displacement of a lower by an incomparably higher culture. Mycenaean civilization ended with equal abruptness about 1000 B.C. as a result of the Dorian invasion from the north.

The excavations by Heinrich Schliemann at Mycenae (begun in 1876) and Tiryns (1884) contributed much to modern knowledge of Mycenaean domestic and religious life, but his conviction that Crete would produce even more important results has been fully justified by the discoveries, since 1894, of Sir Arthur Evans and others.

The remains of the palace at Cnossus, Crete, exhibit architectural talent of a high order. Most interesting are the Throne Room, the Hall of the Double Axe, possibly the fetish of some divinity, and the Queen's Hall, with frescoes representing religious processions, bull fights, boxing contests, and other scenes from national life. Explorers have been struck by the excellence of the sanitary arrangements indicated, and the similarity of the female attire to that of a modern society lady. The early non-Aryan inhabitants of Crete probably belonged to the so-called Mediterranean race, distinguished by long heads, dark complexions, and shortness of stature. They at first used a pictorial system of writing, and later, linear signs; numerous specimens have been discovered

General Adye,
British soldier

Aegean Sea. It separates Greece from Asia Minor and is studded with islands. The Dodecanese were of some strategic importance in the Second Great War

but not deciphered. Essentially a seafaring people, they carried on an extensive commerce, especially with Egypt. Frescoes on the tomb of an Egyptian viceroy represent Keftiu, by whom Cretans undoubtedly are meant, bringing tribute to Thothmes III (1500-1450 B.C.). The chief industries were pottery and olive oil. The Cretans were skilled carpenters and metal-workers, but agriculture seems to have been little practised. They had a metal currency and a system of weights of Babylonian origin. The chief Cretan divinities were two, the most important a nature-goddess, with a younger male subordinate, the former identified with various Hellenic goddesses, the latter with Zeus.

Bibliography. Crete, the Fore-runner of Greece, H. B. Hawes, 1911; The Oldest Civilization of Greece, H. R. Hall, 1901; The Palace of Minos at Knossos, Sir Arthur Evans, 1921, and 1928; History of the Ancient World, M. Rostovtzeff, 1926; Dawn of

European Civilization, V. Gordon Childe, 1925.

Aegean Sea OR GREEK ARCHIPELAGO (Gr. *archipelagos*, chief sea). That part of the Mediterranean which lies between Greece and Asia Minor. Its length N. to S. is about 400 m., its greatest breadth is about 170 m. In parts very deep, more than 7,000 ft. having been sounded in the S. basin, its navigation is hazardous and difficult. The waters abound in fish and sponges. The chief of its numerous islands are Euboea (the largest), Mitylene, Thasos, Samothrace, Imbros, Lemnos, Chios, Samos, the Sporades, and the Cyclades.

The Dodecanese (*q.v.*) are, as the name implies, a group of 12 Aegean islands (13 if Rhodes is included) first occupied by Italy in 1912 and restored to Greece in 1947. During the Second Great War, naval and military bases in the Dodecanese were frequently attacked by British aircraft, and

there was considerable bombing of Axis shipping. After the fall of Greece in 1941, all the islands were controlled by Italo-German garrisons. It was hoped that they would be immediately liberated with the capitulation of Italy to the Allies in 1943, and British forces were landed on Kos, Leros, and Samos. But the Italian commander on Rhodes surrendered to the Germans on Sept. 3, and this led to the assertion of German domination of Kos, Leros, and Samos. The liberation of Athens in Oct., 1944, reversed the position. On Sept. 9 British and Allied warships had launched a campaign for the destruction of all German-controlled shipping in the Aegean. Naxos, Lemnos, Karpathos, and Santorini were occupied in Oct., and with the liberation of the Greek mainland, Dec., 1944, German garrisons on other islands (some 20,000 men) were marooned. They surrendered in May, 1945.

Aegerine OR ACHMITE. Green to brown natural silicate of sodium and iron. It is an alkaline member of the group of monoclinic pyroxenes, and is found only in igneous rocks that contain an unusually high percentage of alkalis, especially of soda.

Aegeus. In Greek legend, king of Athens and father of Theseus. On returning from Crete, whither he had gone to deliver Athens from the tribute to the Minotaur, Theseus forgot to change his black sails for white, the agreed signal of his success. Aegeus, seeing the black sails, threw himself into the sea, which, according to tradition, thereafter bore the name of Aegean. See Minotaur.

Aegina. Island and ancient city of Greece in the Saronic or Aegina Gulf. About 40 sq. m. in area, it is mainly rugged, fertile though stony on the W., produces cereals, wine, and fruit, manufactures pottery, and has a valuable sponge fishery. The city, conquered c. 456 B.C. by the Athenians after a nine months' siege, dates back to pre-Dorian times. Some remarkable sculptures were excavated from the ruins of the temple of Aphaea in 1811 and taken to the Glyptothek at Munich. Pop. island, 8,500; city, 4,500.

Aegina, GULF OF, OR SARONIC GULF. Opening of the Aegean Sea in S.E. Greece. About 50 m. long and 35 m. wide, its islands include Aegina and Salamis. Its N.E. and N.W. divisions are called Eleusis Bay and Kekkries Bay respectively. The shores, deeply indented, have good harbours.

1. Late Minoan vase ornamented with a realistic octopus (c. 1600-1500 B.C.). 2. Bull-fighting at Knossos on a fresco. 3. Throne from the Palace of Minos, in white stone with leaf-shaped back (1550-1400 B.C.). 4. Ivory and gold statuette of the Minoan Snake Goddess (c.

1500 B.C.). 5. Fresco from Tiryns, a Greek prehistoric site (c. 1400 B.C.). 6. Lion Gateway at the great citadel of Mycenae (after 1400 B.C.). 7. Carved steatite vase (c. 1600 B.C.) from Hagia Triada, Crete, showing vigorous groups of boxers

AEGEAN CIVILIZATION IN CRETE AND GREECE ABOUT 3,500 YEARS AGO

Aegir. In Norse mythology, the giant of the seashore. He was the husband of Ran, the storm giantess, and father of nine daughters—the billows. He visited the gods in Asgard and asked them to feasts in his hall on the island of Hler. Angry with Thor, he demanded from him the possession of the giant Hymir's mile-deep cauldron in which to brew ale for them all. The name is also applied to the bore or tidal wave on the English river Trent.

Aegis. In Greek mythology, the shield of Zeus and other divinities. The word now has the general meaning of protection.

Aegisthus. In Greek legend, son of Thyestes and cousin of Agamemnon. During his cousin's absence at the siege of Troy, Aegisthus carried on an intrigue with his wife Clytaemnestra. On his return Agamemnon was murdered by them, a crime avenged later by Agamemnon's son Orestes.

Aegium or **AEGION.** Town of Greece. On the S. shore of the Gulf of Corinth, it has an excellent harbour. It was the capital of Achaea, the meeting place of the twice-yearly assembly of the Achaeans (q.v.). It is also the legendary birthplace of Zeus.

Aegospotami, **BATTLE** OF. Fought in 405 B.C. at the mouth of a river in the Thracian Chersonese of the same name, between the Athenian fleet and that of the Spartans under Lysander assisted by a Persian squadron. The defeat of the Athenians destroyed their naval supremacy and deprived them of the hegemony of Greece. The name Aegospotami means goat-rivers.

Aegrotat (Latin, he is ill). Phrase used at universities and other educational establishments for a certificate excusing a student from work or college duties on account of illness. A student unable to complete the work of an examination for this reason may be given an aegrotat or pass certificate, the examiners being satisfied that but for illness he would have passed in the ordinary way.

Aehrenthal, **COUNT ALOIS VON** (1854-1912). Austro-Hungarian statesman. Born Sept. 27, 1854, at Grosskal, in Bohemia, he studied at Prague and Bonn, and in 1877 entered the diplomatic service as attaché at Paris. He was at St. Petersburg as

Count Aehrenthal,
Austrian statesman

attaché, 1878-83, as councillor of legation, 1888-94, and as ambassador, 1899-1906; in 1895-99 he was envoy extraordinary at Bukarest. In Oct., 1906, he succeeded Count Goluchowski as foreign minister, and in 1908 startled Europe by the annexation of Bosnia and Herzegovina. He was identified later with the peace party. He died Feb. 17, 1912.

Aelfric (c. 955-1022). English scholar. A pupil of Ethelwold, first at the Benedictine monastery of Abingdon and then at Winchester, he was made abbot of the new monastery of Cerne Abbas, Dorset, in 987, and later head of the Benedictine monastery at Eynsham, near Oxford, where he died. His main works include 80 Homilies, his Colloquium, a Discourse on the occupations of monks, and translations of the books of Genesis, Numbers, Deuteronomy, Judges, Esther, Job, and Judith. In the controversies of the 16th and 17th centuries certain passages from Aelfric's works were quoted by the reformers as anticipating the denial of the doctrine of transubstantiation. See Aelfric, C. L. White, 1898.

Aelia Capitolina. Name given to the city built by the emperor Hadrian, c. A.D. 130, on the site of the ancient Jerusalem, which had been destroyed by Titus, A.D. 70. It was called Aelia Capitolina from Aelius, the family name of Hadrian, and from its temple dedicated to Jupiter Capitolinus. Hadrian made it a Roman colony. See Jerusalem.

Aelianus Tacticus. Greek military writer. He lived in the 2nd century A.D. and wrote a treatise on military tactics, which was regarded as a useful text-book until modern times. The tactics described are those of the Macedonians after the time of Alexander the Great. There are English versions by J. Bingham, 1616, and Viscount Dillon, 1814.

Aelfred or **AETHELRED** (c. 1109-66). English writer and saint. Born at Hexham, he spent his youth at the court of David, king of Scotland. He became a Cistercian monk and was abbot of Revesby in Lincolnshire, 1142, and of Rievaulx in Yorkshire, 1146. A friend and adviser of Henry II, he made a name as an evangelist to the Picts of Galloway. His chief historical writings, all in Latin, are *The Life and Miracles of S. Edward, King and Confessor*; *On the Battle of the Standard*; and *A Chronicle from Adam to Henry I.* He died at Rievaulx, Jan. 12, 1166, and was canonised in 1191.

Aemilian Way, **THE,** OR **VIA AEMILIA.** Highway in ancient Italy. Made in 187 B.C. as a continuation of the Flaminian Way by the consul Marcus Aemilius Lepidus, after whom it was named, it ran across the northern flanks of the Apennines from Ariminum (Rimini) to Placentia (Piacenza) and Mediolanum (Milan), a distance of more than 180 m. Continued later to Aquileia, parts of it are still used. It gave its name to the province of Emilia.

Aeneas. In classical legend, Trojan hero. According to the story in Virgil's *Aeneid*, after the fall of Troy he escaped with his father Anchises and his son Ascanius or Iulus. After much wandering he was driven by a storm to Carthage, where he won the love of Dido, its queen, who, being abandoned by him, committed suicide. He afterwards made his way to Latium in Italy, where Latinus, the king, promised him his daughter Lavinia in marriage. Turnus, a native chief and former suitor of Lavinia, refused to give her up; war ensued between the rivals and Turnus was killed. Aeneas married Lavinia and became the ancestor of the Romans. Killed in battle while fighting against the Rutulians, he was worshipped as a god. See Virgil.

Aeneas Silvius. Name by which Pope Pius II (q.v.) is frequently known. His full name was Aeneas Silvius de' Piccolomini.

Aeneid. Epic poem in twelve books by the Roman poet Virgil. Based on the legendary adventures of the Trojan hero Aeneas after the fall of Troy, it is really a glorification of Rome and of the Julian house to which the Emperor Augustus belonged, and as such became the national epic. Modelled on Homer's *Iliad* and *Odyssey*, it ranks with the greatest poetry of all time. Best edition of text with notes, by J. Conington and H. Nettleship, 1881-3; Eng. prose trans. by Conington, 1872, J. W. Mackail, 1885; verse, John Dryden, 1697, William Morris, 1875. See Virgil.

Aenigmatite or **COSSYRITE.** Geological name for the only member of the amphibole group of minerals that has triclinic symmetry. It is a titanate-silicate of sodium, iron, and aluminium, and is confined to igneous rocks containing a high percentage of soda, such as the nepheline-syenites of Greenland. In these it occurs as black crystals several inches in length. Small crystals (cosyrite) occur in the lavas of the island of Pantellaria.

Aeolian Deposits (Lat. *Aeolus*, god of the winds). Deposits formed of wind-carried particles of varying degrees of coarseness. They have been formed on land surfaces and may be detected among the rocks of various geological periods. The chief Aeolian deposits are the sand dunes of coastal regions, the sands of deserts—e.g. Sahara—and the great loess deposits of Asia. Wind-blown sands are remarkable for the extremely rounded character (millet seed) and high superficial polish of individual grains.

Aeolian Harp. Musical instrument. It consists of a box containing wires or strings loosely stretched to produce musical notes when a current of air passes through them. A gentle breeze causes low notes to sound, and as the air current increases in intensity higher notes of the harmonic series are elicited.

Aeolian Mode. In music, an old church mode beginning on A and using only the natural notes, the white keys of the pianoforte. The scale, therefore, was like the present scale of A minor.

Its dominant was E. See Mode.

Aeolians. One of the three great branches of the ancient Greeks. They spoke a dialect distinct from that of the Dorians or the Ionians. The poets Alcaeus, Sappho, and Anacreon wrote in the Aeolic dialect. The original home of the Aeolians, who claimed descent from Aeolus, son of Hellen, was in Thessaly, but they spread to the other parts of N. Greece, and colonised the islands of Lesbos and Tenedos and a strip of land on the coast of Mysia in Asia Minor, afterwards known as Aeolis.

Aeolipile or **AEOLIPYLE** (Lat. *Aeolus*, god of the winds *pila*, ball). Mechanical toy, illustrating the reaction of the air upon an issuing stream of steam in producing circular motion. It is a hollow ball of metal with hori-

zontal tubular arms, bent at right angles. When partially filled with water and heated sufficiently to generate steam from the arms, the metal globe will rotate. The invention is ascribed to Hero of Alexandria.

Aeolotropy (Gr. *aeolos*, shifting; *trepein*, to turn). Alteration in the electrical, optical, and other physical qualities of a body due to change of position. Thus a tube could be given a twist which would alter its electrical conductivity, and would then be said to be aeolotropic in regard to its electrical conductivity. Iceland spar is a mineral which does not exhibit the same optical refractivity in all directions. Its condition is said to be one of optical aeolotropy.

Aeolus. In classical mythology, king of Aeolia, one of the Lipari Islands. He was the god of the winds, which he kept shut up in a mountain. According to Homer, he gave Odysseus (Ulysses), when starting on his voyage home, a bag containing the unfavourable winds. The bag was untied by one of the crew, the winds escaped, and the ship was forced to return to Aeolia.

Aepyornis (Gr. *aipys*, tall; *ornis*, bird). An extinct wingless bird of Madagascar. Related to the extinct moa and the existing apteryx of New Zealand, it stood about 13 ft. high, and its fossilised eggs, occasionally found in the marshes, are a foot long and correspondingly large in circumference.

Aequi. Ancient Italian tribe in the Anio valley. They were long engaged in hostilities with the Romans, by whom they were finally subdued in 304 B.C.

Aerarium (Lat. *aes*, money). Public treasury in ancient Rome, called aerarium Saturni, because the money was deposited in the temple of Saturn. Under the Empire the aerarium lost much of its importance, becoming the treasury only for the city itself and the senatorial provinces; the financial administration of the imperial provinces was a charge upon the fiscus, or emperor's private purse. At the beginning of the 2nd century A.D. the fiscus became the sole national treasury, the functions of the aerarium being confined to the city.

Aerated Waters. Beverages charged with an excess of carbonic acid gas (carbon dioxide) or, occasionally, oxygen. Aerated waters were originally made about 1767 in imitation of natural mineral waters, but the term now

includes beverages such as lemonade and ginger ale which contain no mineral matter.

Aerated waters were first made by machinery on a commercial scale early in the 19th century, the Struve patent (4,851 of 1823) being the earliest example of the machines employed. The essential apparatus consists of a carbonic acid gas generator, a gas-holder, a saturator, and a bottler. The carbonic acid gas is made by the action of sulphuric acid on whiting (calcium carbonate) or sodium bicarbonate, the advantage of using the sodium salt being that the by-product, sodium sulphate, is useful. In smaller installations and soda fountains, liquid carbonic acid gas, prepared by the complete combustion of coke, is employed.

When the gas is generated it is passed into the gas-holder and the pressure applied which is required in the subsequent operations. The saturator contains the water which is to be saturated with the gas. It is fitted with an agitator or mixer to ensure that the water shall take up the

Aepyornis. Reconstruction of the extinct bird which was 13 ft. high

maximum amount of gas. In practice four volumes of gas per volume of water is the amount allowed. If plain water is used in the saturator the product is simply aerated water, but for other varieties the different salts are first dissolved in the water. For soda-water 80 gr. of sodium bicarbonate per gallon is used; for potash water 32 gr. to 64 gr. of potassium bicarbonate; and for seltz r-water a mixture of the chloride, bicarbonate, sulphate, and phosphate of sodium.

For lemonade or ginger ale plain aerated water is required, as the flavouring and sweetening agents, in the form of a syrup, are placed in the bottles or syphons before the aerated water is added at the bottling machine. The kind of bottler employed varies according as corked or patent

stoppered bottles or syphons are being filled. Makers of aerated waters require a licence (10s. annually). The duty on sweetened table waters was abolished in 1924.

Aerial OR ANTENNA. In radio and television engineering, an elevated conductor or group of conductors from which high-frequency electro-magnetic waves are transmitted, or by which they are received. The simple aerial used for broadcast receiving sets consists usually of a horizontal wire, with or without a vertical continuation, supported on insulators. Other forms are frame aeriels used in portable receivers or direction finders; beam or curtain aerial systems on directional transmitting stations; and similar systems used for the reception of radiations from one direction only. An aerial functions as a transmitter of radio waves when high-frequency oscillating currents are fed into it; similarly, it converts electro-magnetic waves received by it into oscillatory currents, which are again converted in the receiver into audible or visible signals. See Radio; Television.

Aerobatics (Gr. *aerobatein*, to walk the air). Word coined during the First Great War to describe the various abnormal evolutions and trick manoeuvres carried out with aircraft in flight. When such flying was first developed in the years preceding the 1914-1918 war it was termed "stunting." Looping the loop, which is the best known aerobatic, was evolved by Pégoud, the famous French pioneer pilot, in 1913. He also introduced upside-down or inverted flying and the roll. In the latter the aircraft executes a complete revolution in the rolling plane.

During the period 1914-1918 many other forms of aerobatics were introduced. Amongst these are the half roll, the half roll on the top of a loop, the spin and the sideslip. In the half roll the machine turns over on to its back, the nose drops and, after the direction of flight has changed by 180 degrees, level flight is resumed at a lower altitude. In the manoeuvre known as the half roll on top of a loop the pilot flies his aircraft to an inverted position as though he were looping and, when upside down, returns to normal flight by turning right way up through rolling. Height is gained in the process and the direction is changed by 180 degrees. The sideslip is a manoeuvre in which

the aircraft descends at a forwards and sideways angle, the loss of height usually being very rapid. In the spin the aircraft descends vertically and rolls at the same time, so following a spiral track downwards.

The stall turn and Immelmann turn were other manoeuvres introduced in the first air war. The former consists of a rapid climb followed by a cartwheel movement and a dive towards the direction from which the machine had formerly been flying. The Immelmann turn, named after the German fighter pilot, was basically the same. The falling-leaf was yet another manoeuvre developed by airmen in the First Great War. It consisted of a descent (with the engine switched off or idling) when the up-and-down movement of a leaf fluttering to the ground was simulated by rocking the aircraft from side to side.

Marked progress was made in the art of aerobatic flying in the between-wars period. The bunt was a manoeuvre which became popular. It consists of pushing the aircraft into a vertical dive, flying it on to its back and then bringing the nose upward and over until level flight is resumed. The bunt is, in fact, an inverted loop. This trick and inverted turns, in which the aircraft follows a changing course when upside down and the pilot's head is outside instead of inside the turn, require great skill, nerve, and judgement. Yet another advanced aerobatic is the inverted spin. In this the pilot is on the outside of the spin and, as in the

bunt and inverted turn, forces are introduced which tend to hurl the pilot from the cockpit.

Aerobatics are taught in air forces mainly to instil confidence in the pilot and to assist him in acquiring a high standard of accuracy in his flying. Through this advanced training he learns to control his aircraft instinctively and correctly when some unforeseen position arises. There are occasions in air combat and operational flying when an aerobatic manoeuvre may save a critical situation; but experience shows that the chief value of aerobatics is that they aid an airman to gain mastery of his machine. Aerobatics are resorted to by test pilots when new types are being tested for strength and for the efficiency of the controls under varying conditions. See Aeronautics; Flight.

Aerobic (Gr. *aer*, air; *bios*, life). Biological term for micro-organisms which require the presence of oxygen to attain their proper growth and multiplication. Opposed to this is the term anaerobic, referring to organisms which will only grow in the absence of oxygen. The great majority of common organisms in nature, as well as many of the disease-producing germs, belong to the aerobic group.

Aero Club, ROYAL. British society for directing and encouraging sporting aviation. Registered in 1901, in its early years it organized balloon races from Ranelagh. When the aeroplane became a practical machine its activities were greatly extended and it became the official body

Aerobatics. Looping the loop, shown by means of "smoke" trails from five Bristol Bulldogs in a peace-time air display

Charles E. Brown

responsible for the issue of aviator certificates. The first aeroplane pilot's certificate was issued by the club to J. C. T. Moore-Brabazon (Lord Brabazon of Tara) on March 8, 1910. The Hon. C. S. Rolls (*q.v.*) received his certificate in the same month. The club, by the King's permission, assumed the title of the Royal Aero Club of the United Kingdom in 1910. It has been associated with such flying contests as the Aerial Derby Circuit of Britain, and the King's Cup Race. It played a large part in the encouragement of light plane flying clubs before the Second Great War. Its address is 119, Piccadilly, London, W.1.

Aerodrome (Gr. *aēr*, air; *dromos*, course). Original term applied to an aviation ground at which aircraft operate and are housed. Up to the beginning of the Second Great War aerodromes usually consisted of flat pasture land of differing acreage. In the early days of flying and during the First Great War they were of the simplest form, being grass-covered areas cleared of obstructions such as trees and hedges and often undrained. Hangars and workshops were primitive structures of wood or of the Besseneau fabric-covered wood-frame type.

The development of military aircraft, particularly the heavy bomber, necessitated marked changes in aerodrome planning and construction. The great all-up weights of these aircraft and their high minimum speeds during take-offs and landings called for a hard surface on the ground and a great increase in ground space available for these operations. Two or more runways built of concrete or tarmac and laid out according to the prevailing winds were therefore incorporated in the layout of service aerodromes. These runways may be thousands of yards long and link with concrete "aprons" adjoining the aircraft hangars. Perimeter tracks, similarly surfaced, are built around the aerodromes for aircraft to taxi to the starting-points before take-off and to be moved away from the runways after landing. Aerodromes constructed with extensive concrete aprons and runways began to be adopted to a limited extent some years before the war in a few countries where flat grass surfaces are not usually found. These aerodromes were termini for air lines. Coinciding with the development of aerodrome planning were important

advances in the design of aerodrome lighting, radio "beam" systems to assist airmen to land safely in darkness and bad visibility, and methods of obtaining fog dispersal (*q.v.*).

In the early days of flying there were fewer than a dozen aerodromes in Britain, and after more than thirty years some of these, through their long association with flying, carry historical interest. Brooklands aerodrome at Weybridge, Surrey, for example, was the scene of the pioneer work of such men as A. V. Roe (now Sir Alliot Verdon Roe) and T. O. M. Sopwith. The aerodrome at Hendon was opened in 1910 by Claude Grahame-White, the famous veteran airman.

During the Second Great War the word "aerodrome" tended to be replaced by the word "airfield," which is generally used in the United States to describe a flying ground. A terminal aerodrome is usually described as an airport. See Airfield; Airport; Hendon Aerodrome.

Aerodynamics (Gr. *aer*; *dynamis*, power). Branch of physics devoted to the study of the forces which air can exert on a body; because of either the motion of the body through the air or the motion of the air past the body. Every body moving through air creates a disturbance, and when the air currents resume their former flow behind the moving object, a partial vacuum is created which acts as a drag on the moving object.

Aerodynamically, the perfect shape to induce the minimum of air resistance is that of a drop of

Fig. 1. Badly designed body : air flow forms eddies at rear

water, with the bulbous end in the direction of motion. As it moves forward, an object so shaped evenly parts the air which, flowing smoothly over the surface of the body without inducing any of the eddies that create resistance, slips off the tapered tail without creating a vacuum.

Air resistance is the prime factor in the limitation of the speeds of express railway trains and of racing motor cars. In the case of railway trains, doubling the speed squares the air resistance; when

speed is trebled, air resistance multiplies nine times, and so on until the air resistance attains a maximum which the train built on normal lines cannot overcome. This maximum is reached when the train speed is in the region of 100 m.p.h.

Applying the principles of aerodynamics to a railway train means that the front of the engine must be rounded in form, and all projecting parts recessed so that they will not project to create air resistance and thereby reduce speed, while the end of the rear coach must be swept back to a

Fig. 2. Aerodynamically designed body : air flows with minimum of eddies

point. A notable example of a train designed on aerodynamic principles is provided by the Silver Jubilee express put into service by the L. and N.E. Rly in 1935.

One of the most important applications of aerodynamics is to the design of aircraft, and has resulted in better shapes for the main components such as wings and fuselage; smoother surfaces with the elimination of discontinuities that can upset airflow; abandoning of all external excrescences; the retraction of undercarriages; the enclosing of cockpits; and better design of engine cowling and cooling systems. A knowledge of aerodynamics is essential to determine such important factors as the strength of the aeroplane structure, the capability of the aircraft to carry its load, and the degree of its controllability and stability.

In its application, particularly to aircraft, aerodynamics is not an exact science, as many of the air forces acting on a body in motion are not directly calculable from first principles, but have to be determined by experiments in wind tunnels (*q.v.*). Application of aerodynamics to power-driven bodies not only reduces air resistance, but saves fuel consumption in motive power. Experiments have shown that if the modern aircraft could be designed aerodynamically perfect it could fly on one-third of the power now required. See Fairing; Flight; Head Resistance; Streamlining.

AERO-ENGINES: PISTON AND TURBINE

Captain Norman Macmillan, M.C., A.F.C.

This article records their development through forty years, from the experiments of the Wright brothers to the days of jet propulsion.

See also Internal Combustion Engine; Jet Propulsion

The production of the Wright brothers' first petrol engine—a four-cylinder water-cooled 12 h.p. unit driving two propellers by means of open chains, one of which was crossed to make the two air-screws turn in opposite directions to cancel out uneven torque—was the essential element in the world's first aeroplane flights on Dec. 17, 1903, for the brothers had previously solved the problem of control over flight by glider experiments but until they made their own engine, none existed which could convert their glider into an aeroplane.

The evolution of the aeroplane has followed the same course ever since, and the aircraft designer of today still awaits the production of prime movers which will enable him to improve his products in speed, range, and load-carrying.

The Earliest Engines

The Wrights' first engine weighed a little over 200 lb., a ratio of weight to power of about 17 lb./h.p. Their next step was to increase engine power and reduce the ratio of weight to power. Their second engine developed 16 to 17 h.p. and their third 20 h.p. Both weighed 240 lb. The effect was at once noticeable.

Their first machine weighed 745 lb. with pilot and flew at 30 m.p.h. Their second machine weighed 900 lb. and flew at 34 m.p.h. Their third machine weighed 925 lb. and flew at 38 m.p.h. The weight to power ratios of the three machines were 62 lb., 53 lb., and 46 lb. per h.p. By comparison the Lancaster bomber's ratio was 11.8 lb./h.p., while that of the American Thunderbolt fighter's was reduced to as little as 7 lb./h.p.

The second Wright engine had a weight to power ratio of 15 lb./h.p., and the third 12 lb./h.p. Their fourth engine developed 25 h.p. for about 10 lb. per h.p. The Wright "Cyclone 18" air-cooled radial engine of 1943 developed 2,000 h.p., its dry weight was 2,200 lb.—a weight to power ratio of 1.1 lb./h.p.

During the 40 years which elapsed between the first Wright engine and the "Cyclone 18" a great progressive variety of engines flew the skies, while the research for greater power and

the reduction in the weight to power ratio proceeded.

Air-cooled engines were soon in competition with the water-cooled engines of the Wrights.

The greatest early development of aero-engines took place in France. It was there that the 3-cylinder fan-shaped 25 h.p. air-cooled Anzani engine was made with which Blériot flew the English Channel on July 25, 1909. Another notable French engine of that early period was the 24 h.p. water-cooled V8-cylinder Levavasseur engine used in the Antoinette monoplane with which Latham endeavoured to emulate Blériot's cross-Channel flight.

One of the best British engines of that period was the 35 h.p. Green 4-cylinder water-cooled engine. In May, 1920, using a ten-year-old 35 h.p. Green engine, Hinkler flew non-stop from England to Turin in 9½ hours.

Early aircraft speeds were slow, and cooling was therefore inefficient for the first air-cooled engines. Blériot's 38 minutes' flight across the Channel was the longest ever made by the 25 h.p. Anzani, which usually overheated after about 20 minutes. But flying through a rain shower cooled Blériot's engine; his success was really a triumph for water cooling.

Rotary Engines

The search for more efficient air cooling produced the rotary engine. This engine had a fixed shaft around which the crank-case revolved, so that the radially disposed cylinders were cooled not only by the forward motion of the aircraft but also by their own movement.

The first rotary engines were French. The earliest model was the 34 h.p. 5-cylinder Gnome. The next model was the 50 h.p. 7-cylinder Gnome which drove Paulhan's winning Farman aeroplane in the 1910 London-to-Manchester flight for the Daily Mail £10,000 prize. Then followed a 7-cylinder 80 h.p. model. These engines had a mechanically operated exhaust valve in each cylinder head, and an automatically operated inlet valve in each piston head.

Fuel was fed into the crank-case through the fixed shaft and the gas found its way to the combus-

tion chamber via the somewhat unreliable piston valve.

Then came the 9-cylinder 100 h.p. Gnome Monosoupape engine, which retained the principle of one valve per cylinder head, but used inlet ports in the cylinder walls instead of the piston valve.

The 80 h.p. and 110 h.p. 9-cylinder Le Rhône, the 85 h.p. 7-cylinder Clerget, and the 110 h.p., 130 h.p. and 140 h.p. 9-cylinder Clerget engines all used two valves per cylinder head, one for inlet and one for exhaust. These rotary engines brought the weight to power ratio down to about 3 lb./h.p. and were widely used in the First Great War. The 80 h.p. Le Rhône that engined the Sopwith Pup weighed 240 lb. and could develop 93 h.p. at 1,200 r.p.m. The Monosoupape used in the Avro 504 and the D.H.2 developed 100 h.p. at 1,200 r.p.m. and weighed 300 lb.

There were two 14-cylinder double-row rotary engines, the 120 h.p. Le Rhône, and the 140 h.p. Monosoupape; the second engine weighed 2.46 lb./h.p.

British Designs

The 160 h.p. Bentley 1 and the 240 h.p. Bentley 2 were the two British-designed rotary engines. The weight of the B.R.1. was 405 lb., giving it a weight/power ratio of 2.6 lb./h.p. The B.R.2 weighed 498 lb., with a ratio of 2.08 lb./h.p. The Bentley 2 marked the limit of development of the rotary engine, because of the heavy stress due to the rotation of the major part of the rotary engine's weight.

Rotary engines required frequent dismantling for overhaul. The permitted running time was: Le Rhône 30 hours, Gnome 40 hours, Clerget and Monosoupape 60 hours, and Bentley 90 hours. Even their great ease of removal from and refitting to aircraft could not compensate for the frequency of overhaul periods, and soon after the First Great War the rotary engine died out.

FIRST GREAT WAR DEVELOPMENTS. The water-cooled engine was enormously improved during the First Great War both in power and in weight to power ratio. The Hispano-Suiza V8-cylinder water-cooled engine weighed 490 lb. dry and developed 200 h.p. at 2,000 r.p.m. Other water-cooled engines developed during the First Great War were the Rolls-Royce 6-cylinder 100 h.p. Hawk; the 120 h.p. and 160 h.p. 6-cylinder Beardmore;

1. Avro Gnome, 50 h.p. 7-cyl. rotary, 1910. 2. Bentley B.R.2, 240 h.p. 9-cyl. rotary, 1914. 3. R.R. Eagle VIII, 360 h.p. 12-cyl. V; like the Bentley, it was in operational use in 1918. 4. Bristol Pegasus, developing 580 h.p. in 1930. 5. Rolls-Royce "R" engine, which

developed 2,300 h.p. and won Schneider trophy for Britain, 1931. 6. De Havilland Gipsy, 12-cyl. inverted V, 1938. 7. Wright Cyclone, 18-cyl., 1943. 8. R. R. Merlin (2-stage super-charger for high altitude flights). 9. Napier Sabre, 2,200 h.p. 24-cyl. H-type, 1943

AERO-ENGINES: THIRTY YEARS' PROGRESS WITH PISTON UNITS

the 230 h.p. 6-cylinder B.H.P., later called the Siddeley Puma; the V12-cylinder Rolls-Royce 250 h.p. Falcon; and the 300 h.p. V8-cylinder Hispano-Suiza. The Rolls-Royce Eagle VIII water-cooled V12-cylinder engine developed 372 h.p. at 2,000 r.p.m. and weighed 947 lb. dry; its gross weight to power ratio was but 3.1 lb./h.p.; two of these engines powered the Vickers-Vimy aircraft that made the first non-stop transatlantic flight in 1919, and the first London-Australia flight later in the same year. The American Liberty V12-cylinder water-cooled engine developed 405 h.p. at 1,650 r.p.m. with a dry weight of 820 lb., giving a ratio of little more than 2 lb./h.p.

Air-cooled stationary engines were again temporarily eclipsed. The 70 h.p. and 80 h.p. V8-cylinder Renault engines, which were so successful in the early part of the First Great War, were replaced by the 100 h.p. Raf 1a V8-cylinder air-cooled engine and then the 140 h.p. Raf 4a V12-cylinder air-cooled engine; all were relatively heavy engines—5.65, 5.78, 4.61, and 4.85 lb./h.p. respectively.

Succeeding them came the air-cooled radial engines, which, like the rotary engines, were first developed in France in the Gobron, Anzani, and Salmson engines. Among the earliest British radials were the A.B.C. 9-cylinder Dragonfly which developed 385 h.p. at 1,710 r.p.m. with a weight of 540 lb. This engine proved unreliable and was subject to mechanical failures. Contemporaneous with it was the Cosmos Mercury, a double-row 14-cylinder air-cooled radial, built, like the Dragonfly, to satisfy the British Air Board Scheme A issued in 1917. This Mercury developed 347 h.p. at 2,000 r.p.m. and weighed 582 lb. The later Cosmos Jupiter 9-cylinder air-cooled radial developed 450 h.p. at 1,800 r.p.m. and

weighed 562 lb. These engines brought the weight to power ratio below 1.5 lb./h.p.

THE INTERIM PERIOD. Aero-engine development after 1919 was for a long time slow, after the expenditure on research and production fell. By 1923 the Siddeley Jaguar 14-cylinder, two-row air-cooled radial engine developed 360 h.p. and weighed 710 lb.; its maximum running speed was 1,650 r.p.m. By 1925 the Jupiter (then a Bristol engine) developed 485 h.p. By 1930 horsepower had risen to about 600–800 h.p. for normal Service engines, although special racing engines had been built to put forth two to two-and-a-half times that power for short periods. Among the air-cooled radial engines then

were the 625 h.p. two-row 14-cylinder Armstrong Siddeley Panther (2,400 r.p.m.); the 750 h.p. 9-cylinder Bristol Pegasus (2,525 r.p.m.); the 800 h.p. two-row 14-cylinder Pratt & Whitney Twin Wasp (2,400 r.p.m.); and the 735 h.p. 9-cylinder Wright Cyclone (1,950 r.p.m.); their weights were 980; 1,000; 1,162; and 945 lb.

The production of the ultra-light aeroplane in 1923 brought motor-cycle engines into use for aircraft. Converted engines were the $2\frac{1}{4}$ h.p. A.B.C. and the $3\frac{1}{2}$ and 6 h.p. Douglas flat-twin, and the 5 h.p. Blackburn and J.A.P. V-twin engines. Then came the 20 h.p. Bristol Cherub flat-twin specially built for aircraft. These engines were succeeded by the 4-cylinder in-line air-cooled 70 h.p. Cirrus made by the Aircraft Disposal Co., Ltd., from parts taken from the 70 h.p. Renault engines left over from the First Great War; this powered the first Moth in 1925. The Cirrus Minor and Major engines made later by Blackburn Aircraft Ltd., developed 90 h.p. and 150 h.p. and were inverted 4-cylinder in-line air-cooled engines. De Havilland made their first Gipsy engine in 1927; the 1944 range included the 90 h.p. Gipsy Minor, the 130 h.p. Gipsy Major I and 140 h.p. Gipsy Major II, all with the same

The sleeves are given their reciprocating and twisting movement by small cranks engaging lugs on the sleeves

Courtesy of "Flight"

lay-out as the Cirrus. Four-cylinder De Havilland engines were followed by the 200 h.p. Gipsy Six, the 205 h.p. Gipsy Six II, and the V12-cylinder 525 h.p. Gipsy Twelve, four of which powered the D.H. Albatross airliner. All the later D.H. engines were inverted and air-cooled.

About the beginning of the Second Great War aero-engines in the lowest-powered class included the 33 h.p. Carden water-cooled 4-cylinder developed from the 10 h.p. Ford car engine; the 35 h.p. air-cooled V-twin Anzani made by Luton Aircraft Ltd.; and in the U.S.A. the 40 h.p. flat-four Continental, the 40 h.p. Aeronca flat-twin, and the 50 h.p. Menasco flat-four, all air-cooled. These five engines weighed 130 (dry), 110, 154, 121, and 164 lb., all showing a marked advance on the earliest Wright engines.

MODERN ENGINES. At the outbreak of the Second Great War the Bristol Pegasus (with the same capacity as the Jupiter of 1925) could produce 1,000 h.p. at 2,600 r.p.m. for a weight of 1,135 lb., while the newer 14-cylinder two-row Hercules radial gave 1,375 h.p. at 2,750 r.p.m. The 14-cylinder Twin Wasp R-1830 radial gave 1,200 h.p. at 2,700 r.p.m. for a weight of 1,420 lb. The Wright Cyclone-14 GR-2600 double-row radial gave 1,600 h.p. at 2,400 r.p.m. for a weight of 1,900 lb.

By 1943 the Hercules had been further developed to give 1,650 h.p.; Pratt and Whitney had a Double Wasp R-2800 18-cylinder two-row radial giving 1,850 h.p. at 2,600 r.p.m. for a weight of 2,280 lb.; and Wright had produced the Cyclone-18 GR-3350 giving 2,000 h.p. for a weight of 2,200 lb. These last two engines made possible the construction of aircraft like the Martin Mars 70-tons flying boat, and the Boeing B-29 Super Fortress bomber, which bombed Japan from China and Saipan.

During the first decade after the First Great War the Napier Lion was the most prominent British water-cooled engine. This 12-cylinder three-row broad arrow design developed 450 h.p. in 1920 and produced 700 h.p. about ten years later. As a racing engine the Lion VII-D was boosted to over 1,250 h.p. for the R.A.F. Schneider Trophy racing aircraft in 1927-29.

The Diesel or compression ignition aircraft engine has now been outclassed by the high efficiency petrol engine, but about midway between the wars Diesel

efficiency for long-range flight exceeded that of petrol engines. The subsequent introduction of 87, 90, and 100 octane fuels reversed the position. Bristol in the U.K. and Packard in the U.S.A. experimented with Diesel engines, but the only Diesel engine produced in quantity was the German Junkers Jumo 205 of 700 h.p. at 2,500 r.p.m. and 1,257 lb. weight. Napier had a

licence to build them in Britain. This German Diesel engine with six cylinders, twelve pistons, and two crank-shafts geared to a common air screw shaft, gave many maintenance problems in service. Nevertheless, the Diesel engine may some day be used for long range freight aircraft where optimum speed is not as important as economy of operation. It uses a heavier fuel than the petrol engine, with a lower fuel fire-risk, and dispenses with spark plugs.

ROLLS-ROYCE SERIES. This modern series of liquid-cooled engines began with the F.11. No. 1 first flew in Aug., 1927, piloted by Capt. Norman Macmillan. That engine was the prototype of the Kestrel, and from the Kestrel were developed the Buzzard, Merlin, and Griffon. The Merlin engine won the Battle of Britain in 1940, proving its superiority over German engines used by the Luftwaffe in that most gruelling of tests.

The Kestrel engine was made in a large series, with slightly varying characteristics, but typical examples were the moderately super-

Aero-engines. The complete Rolls-Royce Merlin series 620 "power-egg," as installed in the Avro Tudor and other notable post-war aircraft

Photo, Rolls-Royce, Ltd

charged Marks VII, VIII, and IX which developed 680 h.p. at 2,900 r.p.m. for a weight of 975 lb. The Buzzard developed 955 h.p. at 2,300 r.p.m. for a weight of 1,540 lb. The 1929 Schneider Trophy "R" engine developed from the Buzzard gave 1,900 h.p. at 2,900 r.p.m. and the 1931 engine gave 2,300 h.p. at 3,200 r.p.m. for respective weights of 1,530 and 1,630 lb.

The 1939 Merlin II developed 1,030 h.p. for a weight of 1,335 lb. and the Merlin X gave 1,145 h.p. with a two-speed supercharger, both at 3,000 r.p.m. The later Merlin XX gave 1,260 h.p. for a weight of 1,450 lb. The Merlin LXI, provided with a two-stage (two-blower) supercharger, maintained ground level power to 40,000 feet, where the charge was compressed to six times atmospheric pressure.

A supercharger is an air blower or compressor built into the engine's induction system to raise the air pressure within the system and so force more air into each cylinder during its intake period. More fuel must be metered to balance the additional air. Greater power can be obtained from the higher gas pressure of a supercharged engine than from a non-supercharged engine of equal size. In practice supercharging is largely used (1) to increase power for taking off and (2) when flying at a height where power would normally fall owing to the lower density of the air. Superchargers are variously driven by gears from the engine shaft, by the exhaust gases (turbo-superchargers), and in the Daimler Benz turbo-supercharger engine by a fluid flywheel drive that compensates variations in air density as the aircraft changes height.

All the Rolls-Royce engines were V12-cylinder designs, liquid-cooled, not by water alone, but by a mixture of ethylene-glycol

Aero-engines. Increase in speed of climb, from take-off, of the Spitfire, resulting from Merlin engine development

From Fedden, "Aircraft Power Plant"

and water which has a greater temperature range between freezing and boiling points.

ENGINE DEVELOPMENT. In 1903 the Wright engine developed 3 h.p. per cylinder. In 1913 just over 18 h.p. per cylinder was considered good. In 1918 the Liberty engine gave 37.5 h.p. per cylinder. In 1923 the Jupiter gave 50 h.p. per cylinder. In 1939 the Pegasus gave 111 h.p. per cylinder. The early Griffon gave 146 h.p. per cylinder and before the end of 1944 produced 170 h.p. per cylinder. Penultimately the V12-cylinder engine (according to Sir Roy Fedden, 1944 Wilbur Wright Memorial Lecturer before the Royal Aeronautical Society) may produce about 2,400 h.p. or 200 h.p. per cylinder.

ments were soon discontinued, perhaps because of the urgency of war conditions.

Napier have for long been developing the "H" type engine, which began with the Rapier, a 16-cylinder air-cooled engine with eight upright and eight inverted cylinders each in two rows of four, and developing 305/385 h.p. at 3,500/3,900 r.p.m. for a weight of 720 lb. Next came the Dagger, with 24 cylinders similarly disposed in rows of six, and weighing 1,280 lb. with a power output of 630/705 h.p. at 3,500/4,000 r.p.m. The Mark VIII Dagger was developed to give 925/955 h.p. at 4,000/4,200 r.p.m. for a weight of 1,390 lb. The Dagger was air-cooled. Then came the 2,200-2,400 h.p. Sabre 24-cylinder "H" engine, with horizontal instead of

put it is thought that the piston engine will not be able to compete with the gas turbine. It is also regarded as possible that the limit of airscrew conversion of power may be reached with units of about 10,000 h.p.

Gas Turbines and Jet Propulsion Units

The gas turbine as a prime mover has long been sought, but its employment in aircraft was achieved only after the beginning of the Second Great War. Four nations—Italy, Britain, U.S.A., and Germany—employed the gas turbine prior to 1945. The gas turbine principle is simple. A compressor is fed with air as the aircraft moves through the air. After compression the air passes into a combustion chamber into which fuel is metered, and there

Aero-engines. Standard poppet-valve type: 1,000 h.p. Napier-Halford Dagger with 24 cylinders in form of letter H. Characteristic features are the twin crankshafts, hydraulic tappets, and supercharger

Courtesy of "Flight"

The two-row 18-cylinder radial engine can produce over 3,000 h.p., but when the penultimate power of this type of piston engine came in sight, with the demand for more power still growing, attention was given to other types of piston engines. Rolls-Royce developed the single-crankshaft 24-cylinder "X" engine which gave 1,845 h.p. at 3,000 r.p.m. The Allison Division of General Motors Corporation, biggest makers of liquid-cooled aircraft engines in U.S.A., produced a 2,200 h.p. 24-cylinder double-crank-shaft double-V engine. But, in both cases, the initial experi-

vertical cylinders, and liquid-cooled, with sleeve valves instead of the poppet valves used in the earlier engines. Rolls-Royce also produced a similar "H" engine—the experimental Eagle—with a nominal output of 3,500 h.p.

"H" engine development may produce engines of up to 6,000 h.p. Pratt and Whitney's Wasp Major, a 25-cylinder four-row radial unit developing up to 3,500 h.p., was in wide use by 1949; but 42-cylinder six-row radials producing about 8,000 h.p. are regarded as the final power development of piston petrol engines. Beyond that power out-

the mixture is fired, at first by a sparking plug and subsequently by spontaneous combustion due to the non-dissipated heat. The burning gas, under increased pressure, passes rearward and drives a turbine. The turbine is coupled to the compressor by a shaft and provides the power for the compressor. After flowing through the turbine, the gas, still at high pressure, is emitted through a suitably ducted passage and orificed jet. To start the engine an electric motor drives the compressor to feed air into the combustion chamber.

With high speed vehicles, such as aircraft, propulsion can be pro-

Aero-engines. The Armstrong Siddeley Python, an airscrew turbine (prop-jet) type in the highest power class
 "Flight" copyright drawing

vided by the reaction of the jet. But jet propulsion efficiency equals and exceeds the normal airscrew only at high speeds and altitudes. At 20,000 feet the optimum propulsive efficiency of the propeller is reached at 300 m.p.h. Above that speed jet efficiency improves, equalling the propeller at 540 m.p.h. and surpassing it at higher speeds. At 30,000 feet the jet equals the propeller at 450 m.p.h. These figures indicate that in the widest field of aviation the two methods of propulsion are complementary, with each having its most efficient speed range. This is further borne out by the comparison of fuel consumption. Compared with the piston engine operating at its most efficient fuel economy, the cruising consumption of fuel for gas turbine jet propulsion is from two to three times greater; this should not, however, be considered final, and better consumption should be realized as development continues.

Other developments of the gas turbine have combined the properties of airscrew and jet propulsion by making the turbine drive not only the compressor but also an airscrew. In this case the power developed by the prime mover is apportioned in the ratio of about

75 p.c. to the airscrew and about 25 p.c. to the jet.

The advantages of gas turbines over piston engines may be summarised as lighter weight to power ratios, fewer and less complicated moving parts, more compact design rendering mounting within the wing a simpler process, more even torque reducing vibration to the minimum and making the unit suitable for shaft drive to remote airscrews, greater power per unit, and the use of cheaper fuels having a lower crash-fire risk than high octane petrols.

Aerofoil. The mainplanes, tailplane, elevator, fin, and rudder

of an aircraft are classified technically as aerofoils. Constructed to follow the streamline principle, they are shaped so that the effects of the airflow known as lift and drag can be utilised to keep the machine in the air and control it. The various sections of wings, which number hundreds, are termed aerofoils and in aeronautical engineering are known by names and numbers. See Aeronautics; Aeroplane.

Aerolite. Meteorite consisting entirely of stony material. It is in contradistinction to siderite, which consists only of metal, iron, and to siderolite, which is made up partly of metal and partly of stony matter. The stony material is usually a mixture of silicates of iron and magnesium, such as olivine, pyroxene, etc.

Aerometer (Gr. *aēr*, air; *metron*, measure). Instrument used in chemical and physical laboratories to compare weights and gases.

Aero-engines. Jet propulsion working cycle. 1. Shaft rotated by starting motor; air is drawn in and compressed by rotary compressor into combustion chamber. 2. Fine jet of fuel sprayed into compressed air; mixture, ignited by electric glow plug, burns continuously. 3. Mixture of heated combustion gases and air thrusts at high velocity through turbine, causing it to rotate and drive compressor; igniter plug is now switched off and operation continues so long as fuel is injected. 4. Stream of gas and air leaves turbine and issues from propulsion nozzle at high velocity

AERONAUTICS: MAN'S MASTERY OF FLIGHT

C. G. GREY, First Editor of The Aeroplane

In the following contribution the whole progress of aerial navigation from its inception is carefully outlined. The varied branches of the subject are all adequately dealt with under their respective headings and reference should be made therefore to Aeroplane; Air Fighting; Airship; Air Transport; Aviation, Civil; Balloon; Flight, and individual aircraft

The word aeronautics includes, as its etymology implies, everything concerned with the navigation of the air, such as, for example, the study and charting of the atmosphere, the science and practice of navigating aircraft, the construction of lighter-than-air and heavier-than-air craft and all their component parts and accessories. In its more limited sense aeronautics pertains to the practice of aerial navigation; that is to say, travel in the air by all forms of aircraft.

The first vehicles to navigate the air were balloons. Setting aside the suggestion of Leonardo da Vinci that an aerial vehicle could be made by exhausting the air from a metal globe, we find a

Some years later Tiberius Cavallo also found that bladders were too heavy and that paper would not hold hydrogen, but in 1782 he inflated soap bubbles with hydrogen and discovered that they would float upwards until they burst.

Meantime the brothers Stephen and Joseph Montgolfier had discovered that by inflating a paper bag with hot air it would rise; they argued, therefore, that if a paper bag could be filled with a cloud-like substance, namely smoke, it also would float. On this hypothesis they experimented with paper bags up to 700 cubic feet capacity, under which they lighted fires of chopped straw. Although they obtained immediate successes, it is of interest to note that it was some time before the brothers realized that the real lift was given not by the smoke but by the fact that the hot air inside the bags was lighter than the atmospheric air outside. Encouraged by their success, the Montgolfiers built a spherical paper balloon 30 feet in diameter with a capacity of 1,300 cubic feet, which was sent up June 5, 1783, without a passenger.

Almost coincidentally with this, M. de Saint Fond, a naturalist, and M. Charles, a professor of natural philosophy, and two brothers named Robert produced a hydrogen balloon, and this was sent up Aug. 27, 1783, from the Champ de Mars in Paris. This balloon was 13 feet in diameter,

weighed under 20 lb., and was made of thin silk coated with rubber. Thus we find the two types of balloons—the hot air and the hydrogen—being developed side by side, just as different types of airships were developed coincidentally, and as the different types of aeroplanes developed together.

The distinction of being the first balloonists to take the air belonged to a sheep, a cock, and a duck, which were sent up in a Montgolfier balloon from Versailles Sept. 19, 1783. The balloon descended eight minutes after the start as the air inside it cooled, and the sheep and the duck were found to be uninjured. The cock was found to be very unwell, and its condition was

Montgolfiers' first hot-air balloon, June 5, 1783. It carried no passenger

French missionary writing in 1694 that a balloon was sent up in celebration of the coronation of the emperor Fo-Kien at Peking in 1306. This was mentioned more as an established custom than as a first attempt, and it is possible that the Chinese, with their intimate knowledge of kites and of other scientific instruments concerned with the atmosphere, did actually know how to make a hot-air balloon in those days. In 1766 Cavendish published his estimate of the weight of hydrogen, and immediately afterwards Dr. Black, of Edinburgh, made a skin balloon, which, however, was too heavy to be lifted by the hydrogen which it could hold.

First ascent with two passengers in a free hot-air balloon, Nov. 21, 1783

Earliest flight in a hydrogen-filled balloon from Paris to Nesle, Dec. 1, 1783

attributed by the learned professors present to the rarefied atmosphere above. Closer investigation, however, indicated that it had been trampled on by the sheep.

The first ascent of a man-carrying balloon was made by M. Pilâtre de Rozier, who went up in a Montgolfier balloon Oct. 15, 1783. The balloon was attached to a cord so that it could not rise higher than 100 feet, and it was kept at that height for nearly five minutes by the continuous heating of the air inside by means of a fire of chopped straw carried in a brazier under the neck of the balloon. On Nov. 21, 1783, M. de Rozier with the Marquis d'Arlandes

Earliest ascent in a balloon with steering apparatus, at St. Cloud, July, 1784

made the first free balloon ascent. They started from Paris and descended safely in a field five miles away after drifting for 20 minutes at not more than 500 feet.

From this date the actual beginning of aeronautics in the strict sense of aerial navigation may be reckoned. Only seven days later, Nov. 28, a carpenter named James Wilcox ascended at Philadelphia in a car attached to 47 small balloons filled with hydrogen, and made by two Philadelphian scientists, Hopkins and Rittenhouse, so that to him belongs the honour of being the first to ascend by means of hydrogen. The first European ascent in a hydrogen balloon was made Dec. 1, 1783, by Messrs. Charles and Robert, who made a trip of 27 miles from Paris to Nesle in two hours, reaching a height of 2,000 feet.

Balloon and parachute ascent from Vauxhall, July 24, 1837

The natural sequence from the free balloon was the idea of making a navigable balloon. Various attempts were made to propel ordinary spherical balloons by means of oars worked by hand from the car, and even by large propellers made of fabric stretched on frames and turned by a crank from the inside of the car. With these vehicles a certain very limited success was attained; that is to say, they could be propelled over the ground if the air were absolutely calm. From these, very naturally, followed the idea of making a cigar-shaped balloon which would move more easily through the air, and in 1870 a French experimenter, M. Dupuy de Lôme, made a cigar-shaped balloon 29½ feet in diameter which was driven by a two-bladed propeller 11 feet in diameter, which was turned by the united efforts of eight passengers. In this way a speed of a few miles per hour was obtained.

Before this Henri Giffard built in 1852 a spindle-shaped balloon 144 feet long, which was driven by a propeller worked by a 3-h.p. steam engine. This machine made a speed of seven miles an hour. There was a big gap from this until 1882, when the brothers Tissandier built a spindle-shaped balloon driven by an electric motor worked by a bichromate-of-potash battery. This was actually an approach in its general ideas to the modern airship. The next step was taken by Captain Charles Renard, who, in 1884, built another electrically driven airship. The envelope was of a true "streamline" form, being of circular section with tapering ends, its greatest diameter being about one-third of the length from the front. The envelope had a capacity of 66,000 cubic feet.

Meantime the Germans had been investigating on their own account, and in 1879 Herren Baumgarten and Wolfert built the first airship with a petrol motor of Daimler's make. This was smashed in the experimental stage, and after many experiments Wolfert built another airship in 1897 on somewhat similar lines. This machine left the ground, but the gas caught fire and Wolfert and his assistant were killed.

The next steps in the development of airships were made by Santos-Dumont, who constructed numerous small airships between 1898 and 1906, and from his early experiments developed the various non-rigid airships of today. The first rigid airship from which the Zeppelin and the big British types have developed was built in 1897

Lunardi's ascent from St. George's Fields, London, June 29, 1785

by an Austrian engineer named Schwartz. This was made of sheet aluminium over a metal framework. It is believed to have left the ground, but it was not a success. Nevertheless, it was the direct ancestor of the Zeppelin.

It must be understood that balloons and airships operate on the principle that their envelopes are filled with gas which is lighter than the surrounding air, and they therefore float in practically the same way that a boat does in the water, or perhaps one should rather say as a submarine floats, in that they are entirely surrounded by the air and do not float on the surface. Apart from the Montgolfier-type balloons, which operate on the principle that hot air is lighter than cold air,

Departure of Andrée's balloon from Spitzbergen for the North Pole in 1897

First attempt at a man-power airship, made in England in 1834. It was to be propelled by wings

all balloons are filled either with hydrogen or with coal gas. Coal gas being heavier than hydrogen, airships invariably used hydrogen until the year 1919, and therefore all airships and balloons have been peculiarly liable to destruction by fire because both hydrogen and coal gas are highly inflammable.

It had long been known that helium gas, which is a trifle heavier than hydrogen but a great deal lighter than coal gas, is non-inflammable, but until 1918 it was impossible to produce helium in sufficient quantities to use it for the inflation of airships. In that year it was discovered that certain of the natural gas springs in America contained helium in large quantities, and forthwith preparations were made to secure this helium on a commercial basis for use in airships. On the successes of these efforts, the success of the airship as a passenger vehicle very largely depends.

We may turn now to the question of heavier-than-air craft. As everybody knows, it has been the ambition of man from the earliest legendary periods to fly as a bird flies, and the heavier-than-air flying machine is the direct outcome of that desire. Strictly speaking, the heavier-than-air craft is the only true flying machine, as the lighter-than-air craft floats and does not fly. In all ages attempts have been made to fly with wings,

but without real success until the 19th century.

Very many models were made to fly by means of small steam engines, small petrol engines, and twisted elastic, long before a man-carrying flier was produced. The first steps towards the production of the flying machine

were a variety of types of machine with flapping wings intended to be operated by the physical strength of the pilot. None of these achieved any success whatever. The first successful efforts took the form of gliders, which may be best described as aeroplanes more or less on modern lines but without

engines. These gliders were launched as a rule from the top of a hill in the face of a wind, and might be described as free kites. Probably the first successes in this direction were achieved by Sir George Cayley, an English squire, somewhere about the year 1809.

The next successful experiments were made by Prof. Otto Lilienthal, who began experimenting in 1871 and achieved a number of glides of considerable length between 1891 and his death—owing to the collapse of one of his gliders at a height of 50 feet—on Aug. 10, 1896. Among others who made successful gliding experiments were Prof. Chanute, Prof. Langley, Dr. Montgomery, and the brothers Wright in America; Messrs Pilcher, Wenham, Dunne, and Weiss in England; and Messrs. Ader, Blériot, Pénaud, Santos-Dumont, the Voisin brothers, and the Farman brothers in France.

It is claimed that the first power-driven aeroplane to leave the ground was

one built by Clément Ader, which was said to have left the ground on Oct. 9, 1890, but close investigation tends to show that only one wheel of the machine left the ground and that the other was still touching. On the other hand, there is no doubt whatever that an actual controlled flight by a man-carrying power-driven aeroplane was made by Orville Wright at Dayton, Ohio, U.S.A., on Dec. 17, 1903. This stands as the first authentic flight in history. That flight was a straight trip of 852 feet, which was a good deal shorter than some of the glides which had been made previously. Progress was slow from that date until 1908, when a number of experimenters produced flying machines which really flew, and brought into being the aeroplane as we know it today. The first hops from the ground with a power-driven ma-

Model of Monek Mason's aerial machine, 1843, which was propelled by a section of an Archimedeian screw

chine in Europe were made by Santos-Dumont—already well known as an airship experimenter—on Aug. 22, 1906, and on Sept. 12, 1906, a machine built by a Dane named Ellehammer also left the ground under its own power, but on Oct. 23 Santos-Dumont achieved a flight of 200 feet which was clearly not a hop, and so achieved the distinction of being the first person to fly in Europe.

The year in which flying actually began to develop was 1908, for in that year the Blériot monoplanes and the Antoinette monoplanes and the Voisin biplanes flew regularly in France. A. V. Roe and the late S. F. Cody made their first short flights in England. Glenn Curtiss and J. A. D. McCurdy flew the Curtiss machines in America, and the late Wilbur Wright brought an improved Wright biplane to Europe and demonstrated in France the real possibilities of aeroplanes. Prior to the arrival of Wright, the longest flight in

Ascent of Bell's steerable balloon at Vauxhall, July 22, 1850. It was fitted with man-power side propellers

Europe had been one of 12 miles made in 1908 by Henry Farman on a Voisin biplane, but on Sept. 21 Wilbur Wright flew his machine for 60 miles and remained in the air for an hour and a half.

The real starting-point of aerial navigation was 1909, for in that year exhibition meetings took place all over Europe and America and many cross-country flights were made. On July 13 Blériot made the first place-to-place flight from Étampes to Toury and Cheville—a distance of 33 miles—and on July 25 he flew the English Channel from Calais to Dover. On Aug. 27 of that year, at the famous Reims meeting, Henry Farman, on a biplane of his own construction, fitted with the now famous Gnome engine, covered a distance of 118 miles in 3 hours and 5 minutes without alighting, this being the first occasion on which a hundred miles had been covered in the air and on which an aeroplane had remained in the air for three hours. At that period the maximum speed of aeroplanes was under 50 m.p.h., the greatest height known to have been reached by an aeroplane was 500 ft., and not more than two persons had been lifted at once in one aeroplane.

PROGRESS OF AERONAUTICS. Few products of mechanical science and ingenuity have made so much progress as the aeroplane in the 21 years between the armistice in Nov., 1918, and the outbreak of war in Sept., 1939. In 1918 the fastest aeroplanes had a speed of 160 m.p.h. In 1939 the fastest military aircraft could reach about 370 m.p.h. By 1949 that had gone up to 670 m.p.h.

In 1918 a flight of 500 miles non-stop was quite an achievement, but in 1919 John Alcock and Arthur Whitten Brown flew across the Atlantic, some 2,000 miles non-stop from Newfoundland to Ireland. By the end of 1944 more than 20,000 aeroplanes had flown the Atlantic—most of them from west to east, as weapons of war. After the Second Great War transatlantic flying became a routine commercial operation, and direct flights between New York and London and between similar national capitals appeared in the daily time-tables.

At the end of the First Great War most aircraft were biplanes, built as a girder structure of struts and stays, mostly of wood covered with fabric and braced with wire. Prof. Junkers designed and built in 1917 a cantilever monoplane (one in

which the wings were designed to carry their loads without external bracing) all in aluminium, except the engine and certain key points in the structure. The aluminium sheets covering the wings were corrugated from leading edge to trailing edge to resist wing torsion. But for years afterwards most of the world's air liners were still strut-and-wire biplanes. There were, however, notable exceptions in the Junkers, Dornier, and Fokker designs. Although all manufacturing nations prided themselves on having developed highly the science of aerodynamics, their aircraft, up to about the year 1930, showed little knowledge of such a simple thing as "streamlining," a word which means something to everybody today.

After 1930 any aircraft with pretensions to high speed retracted its wheels (or undercarriage) into its body, its wings or engine housings after it left the ground. Most had auxiliary flaps on the wings which were pulled down by hydraulic mechanism (as were the undercarriages) when landing to steepen the gliding angle but also to slow the speed, and to give added lift when taking off.

The performances of modern aircraft are due to increased engine-power. The utmost engine-power of 1918 was 450 h.p. By 1945 1,000 h.p. had become a fair average, and 2,000 h.p. was a high power, but there were engines of 3,000 h.p. flying in 1945. The standard of reliability was very high, with few engine failures on long non-stop journeys across the Atlantic and Indian Oceans, and the deserts of Africa and Asia. (See Aero-Engines.)

The chief effort of the designers of aircraft and engines was devoted to improving weapons of destruction during the years after 1930. Consequently the Second Great War left the world still short of the best possible developments in air passenger transport.

By 1949, however, the U.S. industry had produced the Boeing Stratocruiser, Lockheed Constellation, and Douglas DC-6, all outstanding commercial designs capable of carrying 40-60 passengers over long ranges. The 120-ton Bristol Brabazon made its first flights in the U.K. the same year, as did the 500-m.p.h. D.H. Comet jet air-liner.

Good progress was also made in big seagoing aircraft. The old wooden biplane twin-engined flying boats of 1918, F.3 and F.5, were before 1939 surpassed by the

handsome all-metal monoplane Empire flying-boats, which were built for Imperial Airways, Ltd., by Short Brothers of Rochester, the pioneers of seaplanes. They had four engines of about 900 h.p. each, a maximum speed of 200 m.p.h., and a cruising speed of about 160 m.p.h. Their regular voyage from England to Sydney (Australia) was for years the longest scheduled air-route in the world. Marine aircraft later suffered something of an eclipse owing to their comparatively slow speed and the cost of installing suitable bases. Saunders-Roe, however, were awarded a contract to build three 10-engined flying boats comparable in size to the Brabazon (the Princess class).

THE SCIENCE OF AERONAUTICS. An enormous field is covered by this subject which has grown naturally out of many older sciences, by applying them to the air and adding to them knowledge gained from the action or reaction of the air. The Royal Aeronautical Society, founded in 1866, is the oldest organization in the world which is, and has been, concerned with the science of the air. The branch of general science which is the basis of all aeronautical science is dynamics. Hence the science of aerodynamics (*q.v.*) deals with the action of the air on all forms of aircraft, from children's kites to the fastest aeroplanes or the biggest airships.

Between the First and Second Great Wars eminent aerodynamic scientists discussed the highest speed which an aeroplane could reach, according to calculations and experiments based on existing knowledge at that time. But after war began the highest calculated performances were surpassed in more or less regular steps. Likewise calculations for range without alighting, for load carried with wings of a certain size and with engines of a certain power, and for height reached with given power and load, were constantly being passed. Another important branch of aeronautical science is the calculation of the stresses and strains put upon the parts of aircraft—wings, tails, fins, rudders, ailerons, and even such things as windows or panels in the body, or the mechanisms which work the controls. If aerodynamics can provide the knowledge of the pressure of the air, then the calculations of the sizes of the mechanisms and the materials which the designer may safely use is a branch of mechanical

or structural engineering like building a bridge or a house

Air navigation, which is what the word aeronautics means is a branch or rather a growth out of sea navigation, complicated by the very high speeds of aircraft compared with seagoing ships, and simplified by new scientific instruments, which have been developed for aircraft but could be (and in some instances are) used by seacraft. Meteorology has been so highly developed since 1914 that it might fairly be claimed as a department of aeronautical science. Jet propulsion and rocket propulsion are, for practical purposes of either destruction or transportation the products of aerodynamics as well as of ballistics and chemical science and metallurgy.

AEROPLANE: HOW IT HAS DEVELOPED

Capt Norman Macmillan M.C., A.F.C.

This article tells in detail the story of the origin of heavier than air machines and their development in size, stability and power through half a century. See also Jet Propulsion, Rocket Propulsion

The word aeroplane was not standardised immediately: the motor propelled heavier than air flying machine was produced by Wilbur and Orville Wright, the brothers who first flew a power driven aeroplane called their machine a flyer. Dr Alexander Graham Bell in an address given before the Washington Academy of Sciences on Dec 13, 1906, used the then alternative name aerodrome which had been adopted by Professor S. P. Langley, the secretary of the Smithsonian Institution, U.S.A. But subsequently, aeroplane denoted the machine, and aerodrome the prepared surface area used by aircraft for starting and alighting. The Americans shortened the word aeroplane to airplane, aerodrome, they usually call airfield (or even field), the R.A.F. calls military aerodromes air stations, commercial transport aerodromes are frequently called airports. But the noun aeroplane/airplane is a standard word meaning a heavier than air flying machine with fixed wings usually to be found with all the prerequisites for starting, maintaining flight, and alighting contained within its own structure. Italians use almost the same word "aeroplano". French and Spanish speaking people use the word *avion*. Germans call the aeroplane *Flugzeug*.

The Wright "flyer" of 1903 was the first successful aeroplane (for a description of this aeroplane

Already there are chairs of aeronautics at universities where engineering degrees are conferred upon graduates. In Great Britain a government committee's recommendation was followed by the establishment of a College of Aeronautics on a permanent basis. In April, 1945, the Aeronautical Research Council was set up with Sir Melville Jones as chairman.

and its power unit, see Aero Engines). Their use of three axis air controls assured the Wrights success for these enabled them to balance their unstable craft. All other experimenters had attempted to fly with not more than two axis controls frequently a disastrous experiment with unstable aeroplanes. In 1904 the Wrights made 105 landings, some resulting in breakages. In Sept of that year in a new machine they made their first curved flights. They then made circular flights, the two longest of nearly three miles in five minutes, in these flights they carried iron bars as ballast, first of 50 lb and then of 70 lb weight.

In 1905, in their third aeroplane, they made 49 flights, seven

ended in breakages. By Sept they could make 10 mile flights succeeded by flights of 11, 12, 15, 21 and 24 miles. Then to keep their secrets they ceased to fly, dismantled the aeroplane and in 1906 made no flights while they negotiated with possible purchasers. While the Wrights were power flying Captain F. Ferber was experimenting in France with gliders, and in 1904 gave a lecture in Lyons on his work. Gabriel Voisin came on the platform dedicated his life to aviation and next day left for Paris where he founded the first aeroplane factory in France. Their earliest experiments were conducted with man carrying box kites towed on the Seine by fast motor boats. Blériot began his experiments with the Voisin brothers; he was also an enthusiastic pioneer cinematographer, and his cinematograph records of those early experiments are the best pictorial record of that period. The Voisins made biplanes. Blériot broke away from them and began to make monoplanes in 1908.

Meanwhile Ferber met Levavasseur the inventor of the Antoinette, a light V8 cylinder engine named after the daughter of M. Gastambide who supplied Levavasseur with funds for his experiments. Ferber joined the Antoinette company in 1906 and by 1908 was flying in an aeroplane of his own design; he was killed in Sept 1909 when landing on rough ground near Boulogne.

In 1908 Wilbur Wright visited France alone while Orville demonstrated their invention in America. The Wright machine had two control sticks. The left hand stick moved fore and aft to work the elevator. The right hand stick moved fore and aft to work the rudder and sideways to warp

the wings. The Wrights had to use both hands to fly. The French quickly seized the principle of the three air controls, and Robert Esnault-Pelterie invented the control method which became standard; he used one central stick which controlled the elevator when moved fore and aft and the wings when moved sideways, and operated the rudder with his feet. This control was more natural and it left one hand free for control of the engine. Bériot is believed to have been first to suggest the use of ailerons instead of warping flexible wing-tips.

The French also broke away from the Wright design. Some French designers placed both elevator and rudder controls at the tail, although in those days there were always a dozen different general arrangements of wings, stabilising surfaces, and air controls to be seen whenever a flying meeting was held.

British Pioneers

Although the U.S.A. and France then led the world in aeroplane construction, experimenters were at work elsewhere. Among the earliest designers and constructors in Great Britain after Pilcher and Maxim were Weiss, A. V. Roe, the Short brothers, Dunne, S. F. Cody, T. Howard Wright, and Howard Flanders. After Lillenthal, Schellies had been at work in Germany, Ellehammer in Denmark, and Fokker in Holland, and in America Curtiss had become prominent. In 1903 T. Howard Wright opened the first aeroplane factory in Great Britain under the railway arches in Battersea, London.

A. V. Roe claimed a flight of 60 yds. at a height of two ft. on June 8, 1908, in a biplane of his own construction fitted with an Antoinette engine, but the first officially observed flight in Britain was made by J. T. C. Moore-Brabazon (Lord Brabazon of Tara) on Feb. 27, 1909, in a Voisin biplane at the Isle of Sheppey. On Dec. 18, 1910, T. O. M. Sopwith flew 169 miles from Eastchurch to Tirlemont (Belgium) in a Howard Wright biplane with a 60 h.p. E.N.V. engine and won the Baron de Forest £4,000 prize. This aircraft was all-British.

In Jan., 1939, the French Aero Club issued its first list of pilots' certificates with eight names. These were Delagrèze (who made a solo flight of 60 yds. in an aeroplane of his own design in the spring of 1907), Dumont,

Aeroplane. Key to the names of principal parts. The upper machine is a Hawker Hurricane; centre, Bristol Beaufighter; below, Fairey Fulmar

Esnault-Pelterie, Farman, Wilbur and Orville Wright, Ferber, and Blériot. The first eight British pilots certificated by the Royal Aero Club—J. T. C. Moore-Brabazon, Hon. C. S. Rolls, Alfred Rawlinson, Cecil S. Grace, G. B. Cockburn, C. Grahame-White, Alec Ogilvie, A. Mortimer Singer—were better known for their skill as pilots than for any renown as designers. In 1910 G. de Havilland (later Sir Geoffrey) built his first aeroplane, and crashed it on his first attempt to fly it, fortunately without injury to himself.

EARLY WAR MACHINES. In 1909 Mr. Haldane, then secretary for War, instituted the advisory committee for aeronautics, composed of army, navy, and scientific members, and a department was opened at the National Physical Laboratory to investigate aviation

problems. It worked closely with the Balloon Factory, later the Royal Aircraft Factory, and still later the Royal Aircraft Establishment. In this factory under Mr. (later Lt.-Col.) Mervyn O'Gorman as superintendent, a brilliant team worked, which included de Havilland, Folland, Busk, and Irving. Here were designed the Factory series of army aeroplanes, the B.E., F.E., R.E., and S.E., which were widely used in the First Great War. The B.E. aeroplanes were designed to be, and were, extremely stable; some alleged they were too stable for war aeroplanes. All were biplanes, for a series of accidents with monoplanes in the Royal Flying Corps in 1912 led to a War Office ban on monoplanes.

The First Great War was largely fought in the air with

biplanes. But there were certain notable exceptions. The Germans used the Etrich and Fokker monoplanes, and the Fokker triplane. The British used the French Blériot and Morane monoplanes, and the Sopwith triplane. The biplane continued to hold first place during the decade succeeding the First Great War; exceptions were the German Junkers, Dornier, and Messerschmitt transport aircraft; the Dutch Fokker transport aircraft; the Supermarine and Macchi Schneider Trophy racing seaplanes; occasional experimental military aircraft, and a few civil aeroplanes. One or two triplanes persisted in the years immediately following the end of the First Great War, notably the Bristol Pullman and the Parnall Postal.

Before the First Great War there was little distinction between civil and military aeroplanes, and in many instances, none. During that war the military aeroplane was developed to the exclusion of the civil type, and the first transport aeroplanes of the post-war period were conversions from military designs. The great trans-oceanic and transcontinental flights that succeeded the end of the First Great War—the first direct Atlantic flight (*q.v.*), the first England to Australia and England to South Africa flights—were all made in converted British Vimy bombers. Soon, however, the needs of civil air lines required the production of specialist aeroplanes, and to meet the demand a developing branch of the aircraft industry was devoted to the production of civil aircraft. In Britain were produced the D.H.14, D.H.16, and

D.H.18 single-engined; the Handley Page W.8 and W.10, the D.H.84 and 89 two-engined; the Armstrong Whitworth Argosy and D.H. Hercules, three-engined; and the Handley Page Hannibal and Heracles, the Short Scylla, and D.H.86 four-engined air-liners. Among the early civil transport flying boats were the Supermarine Sea Eagle, the Short Calcutta and Kent (*Scipio* class). All these civil aeroplanes were biplanes; they were the commercial pioneers of the Commonwealth air routes.

DESIGN AND CONSTRUCTION. Simultaneous advances are recorded in design and construction. The earliest aeroplanes, built of wood members braced with piano wire, with fabric-covered wings, and often open or partly open fuselages, were replaced by superior structures using swaged

wire bracing, streamlined where exposed to the air. During the First Great War, Junkers developed all-metal aeroplanes. In 1920 Short Bros. in England produced an experimental all-metal biplane, the Silver Streak. Plywood was often used instead of fabric. Fokker developed plywood-covered wings. D.H.9 fuselages were plywood-covered.

Aeroplane. D.H.2, a rotary-engined pusher machine of 1914-18, designed by Sir Geoffrey de Havilland

Aeroplane. Upper, Dornier Do.X, a flying-boat built in 1929; she weighed 55 tons and had twelve 615 h.p. engines. Lower, Fokker F.36; the wings were of wooden cantilever construction, the fuselage built up of steel tubes

Plywood monocoque fuselages were developed; these dispensed with struts; the bending and torsional stresses were taken through the plywood skin of the hollow tubular structure. Stressed-skin fuselages were also made in metal, as in the Silver Streak, the first example. During the decade succeeding the First Great War, most British aeronautical engineers developed composite metal and wood airframes before producing all-metal airframes; these they covered partly with detachable metal panels and partly with fabric.

Aerodynamic theory was then developing rapidly, and unerringly it pointed towards the adoption of the monoplane. The earlier theory of resistance, based on the

projected frontal area (reduced by efficient streamline) plus parasitic drag, was augmented by Prandtl's mathematical solutions of induced drag and his boundary layer theory of streamline bodies which established that laminar flow (i.e. the flow of air close to the surfaces of the aeroplane body and wings) was a factor of importance in stability and relative resistance. The stability provided by the Handley Page slotted wing was due to its control over laminar flow at large wing angles, preventing wing tip stall. During the Second Great War, American heavy day bombers dispensed with paint camouflage because a smooth polished metal surface gave them a gain of several m.p.h. in speed.

The introduction of the monoplane with a retractable undercarriage as the standard type of aeroplane dated from about 1930. It is noteworthy that its earliest application was to civil aircraft, for the prejudice against the monoplane for military purposes died slowly. The use of the American Lockheed Orion, Vega, and 14, the Douglas DC-2 transport monoplanes, and the French Wibault, and German Junkers 52/3m, marked the beginning of air transport schedules that reduced air travel time between cities; the previous 90-120 m.p.h. cruising speed range was increased by these aeroplanes to 145-170 m.p.h. America introduced the DC-3, a 21-passenger monoplane cruising at 180 m.p.h. France brought out the Bloch 220, Britain the Atalanta, Ensign, Albatross, and Flamingo; Germany produced the Junkers 86 and Heinkel 111, and Italy the Fiat B.R.22 and the Savoia Marchetti 83. Britain introduced the Short Empire flying boats, and from America came the Boeing Clipper. All these commercial aircraft appeared between 1930 and 1939.

In the period 1938-1945 characteristics of military and civil

aircraft were: increased speed; increased structure weight and disposable load; the employment of greater horsepower and, sometimes, as in the Airacobra, shaft drive from a buried engine to its airscrew.

The Mosquito flew at over 400 m.p.h., the Spitfire XIV and P-51 Mustang at 450 m.p.h., and jet-propelled aircraft (Messerschmitt 262, Arado 234, Meteor, and Airacomet) in excess of 500 m.p.h.

The Liberator bomber stalled at 80 m.p.h., the Whirlwind fighter at 83 m.p.h., and the Mosquito and Fw. 190 landed at over 100 m.p.h.

After 1938, wing loading sometimes reached new records—Halifax 50 lb. sq. ft.; Liberator over 54 lb.; Lancaster over 55 lb. Almost all aeroplanes incorporated flaps. The Halifax had slotted trailing edge flaps, the Liberator had Fowler flaps, and the Lancaster split trailing edge flaps.

Split flaps opened from the lower surface of the wing. The

aeroplanes (whether the latter were converted warplanes, as in the York and Lancaster, or new designs, as in the Brabazon) were improved aerodynamically and better streamlined; higher speed, climb, and ceiling; higher land-

ing speed; increased structure weight and disposable load; the employment of greater horsepower and, sometimes, as in the Airacobra, shaft drive from a buried engine to its airscrew.

Depression of the Handley Page flap opened a leading edge slot. The Junkers flap was a variable angle aerofoil permanently fixed below the main wing trailing edge. The Fairey-Youngman flap (Barracuda) could be set like the Fowler flap for landing or like the Junkers flap for taking off, or could be set as an airbrake. Flaps were usually operated hydraulically or electrically, and only at reduced flying speed. Aeroplanes were trimmed in flight by adjustable trimming tabs hinged to the trailing edges of the air controls.

During this period only fighter aeroplanes were fitted with jet reaction prime movers; heavy bombers had attained maximum speeds of about 300 m.p.h., and medium bombers about 400 m.p.h. A few military and civil aircraft had pressurised cabins, notably the Superfortress and Mosquito XVI.

This period saw the introduction of towed gliders for military transportation. Germany was the first to put this method into use, in 1940. Britain subsequently employed larger and better gliders, and by 1944 could transport small tanks by air in the Hamilcar glider towed by Stirling or Halifax tugs. The American glider (Waco) was smaller, carrying only 2 tons load, the British Horsa carried 3 tons, and the Hamilcar 8 tons. (See Glider.)

The scientific use of light alloy structures for monoplane metal wings solved the problems of bending moments with their resulting compression and tension loads,

also the formerly feared wing tip torsion. Nevertheless, wood structures, or composite

Zap flap was a split flap, of which the hinge line moved backward to increase the area of the lifting surface. The Fowler flap was a curved aerofoil which moved back and down until it was clear of the trailing edge. The Gouge flap (Stirling bomber) was similar.

Aeroplane. Upper: De Havilland Comet, an all-wood, stressed skin monoplane, winner of the England-Australia race in 1934. Lower: Hawker Hurricane, a single-seater fighter, which gave remarkable performance

Courtesy of "Flight Handbook"

metal and wood, were not everywhere surpassed, as the de Havilland Albatross and the subsequent Mosquito amply proved. The universal advance in aerodynamic knowledge was revealed in the external form, but various means were employed by different aeronautical engineers to secure ease of manufacture and adequate strength within the essential external characteristics which governed the aerodynamic qualities of the clean monoplane, notable among these being B. N. Wallis's geodetic "basketwork" airframe and wing design.

New developments began others. Variable pitch airscrews were followed by constant speed and fully feathering airscrews. As translational speed and flying height increased, more blade area was required to transmit into thrust the torque of the more powerful engines, and so came airscrews with five blades rotating in one direction, and contra-rotating airscrews with four and six blades. Retractable tricycle undercarriages were developed; these gave greater latitude in speed when alighting, because all wing lift was destroyed when the three wheels touched ground. Devices for de-icing the leading edges of wings were produced, mainly in the form of rubber sleeves through which compressed air was passed to break up ice crustation. Automatic pilots and visual instruments were invented to enable pilots to fly blind through all weathers. High-frequency radio beams were developed to provide an invisible guide line to a safe landing on a fog-bound aerodrome. Radar (*q.v.*) provided aircraft with anti-collision apparatus, and means to navigate when flying blind. Wireless telegraphy and radio telephony gave continuous contact between ground and air and between airborne aircraft.

Military and civil aeroplane developments have always been

scientifically interlinked, although civil aircraft have to incorporate higher standards of safety and comfort; it was to be expected, therefore, that experience gained in the manufacture of military aircraft during the Second Great War would be embodied in greatly improved transport aeroplanes built after it. This expectation was quickly realized in the construction by 1950 of giant passenger aeroplanes like the Boeing Stratocruiser and Bristol Brabazon, of the jet-propelled air-liner the D.H. Comet, and of the Armstrong-Whitworth turbo-propeller air-liner Apollo. These and other post-war types are illustrated in p. 136. Detailed information about all the more important aircraft, military and civil, will be found under their own names.

Aerosols. Colloids in drop solution suspended (like a mist), in the air. Spraying the air in crowded indoor places with solutions of bactericides (disinfectants) in the form of aerosols has been found effective in preventing the spread of disease. *See* Colloid.

Aerostatics (*Gr. aer, air; statikos, at a standstill*). Term originally used to denote the science which deals with atmospheric pressure, the equilibrium of the atmosphere and other gases and the control of such objects as balloons. The word is used in the study of the art and science of air navigation as applied to lighter-than-air craft, *i.e.* an airship which is buoyant in the air because its gas envelope contains hydrogen or helium, gases which make the all-up weight lighter than the volume of air which the aircraft displaces throughout its altitude range. *See* Aeronautics; Airship; Flight.

Aerschot. Town of Brabant, Belgium. It is on the Demer river, 22 m. N.E. of Brussels. Fierce fighting took place here in the opening stages of the First Great War. Particularly severe

German atrocities were committed in the town during an occupation that lasted from Oct., 1914, until the autumn of 1918.

Aeschi. Swiss summer resort. It is in the Frutigen dist. of the canton of Berne, between Lake Thun and the Kander valley, 7 m. S. of Spiez.

Aeschines (389-314 B.C.). Athenian orator and statesman. After serving with distinction at the battle of Tamynae (*c.* 350 B.C.) against Callias, tyrant of Calchis, he became a government clerk, then an actor, and later a clerk again. Entering politics, at that time dominated by the Macedonian menace, he soon won prominence by his eloquence.

Aeschines was a member of several embassies to Philip of Macedon, and he probably succumbed to bribery, for he became leader of the party which urged the futility of resistance. Demosthenes did not hesitate to accuse him of corrupt motives. After the Macedonian victory at Chaeronea (338), Ctesiphon, a friend of Demosthenes, proposed that a golden crown be given to Demosthenes for his services to the state. Aeschines, in 330, prosecuted Ctesiphon on technical grounds. Demosthenes' speech for the defence (*De Corona, on the Crown*), in which he justified his whole anti-Macedonian policy, was a masterpiece, and the verdict went against Aeschines, who retired into exile. Though he had not the education of his great opponent, Aeschines had probably more natural eloquence, and in the judgement of antiquity his oratory was second only to that of his rival.

His three extant speeches are said to have been called the *Three Graces*. *Consult* Attic Orators. R. C. Jebb, 1876.

Aeschylus (525-456 B.C.). Greek tragic poet. He was born at Eleusis, a town of Attica. The

Aeschylus, Greek tragic poet
Bust at Capitol, Rome

prime of his life embraced the period when Greece was struggling for independence against Persia. He fought with distinction in the battles of Marathon (490) and Salamis (480). In 499 he first entered for the prize offered for the best tragedy, but it was not until 484 that he obtained first place. The later years of his life

were spent largely away from Athens, two, perhaps three, visits being made to Sicily, where he died at Gela.

Seventy tragedies in all are credited to Aeschylus, of which only seven survive. Of these the best are *The Persians*, an expression of the sense of triumph felt by the Greeks after the Persian Wars; *Prometheus Bound*, a majestic portrayal of the myth of Prometheus, who stole fire from heaven, and taught the arts to mankind; and the great trilogy of the Agamemnon, Choephoroi, and Eumenides, which relates the return of Agamemnon from Troy, and his murder at the hands of Clytaemnestra, his unfaithful wife; the vengeance exacted by his son Orestes, who kills his mother and her paramour; the pursuit of Orestes by the Furies, and his absolution by the Areopagus at Athens. The Agamemnon is the greatest of all the plays of Aeschylus and one of the world's masterpieces of dramatic literature. Seeing the wicked often prosperous and the good unfortunate in a world ruled by supposedly beneficent deities, Aeschylus endeavoured to explain this anomaly by conceiving a force called Necessity, which underlay the actions of both gods and men, and in the end made for righteousness. The idea of a family curse operating from generation to generation is a dominant motive of more than one of his tragedies.

The characters of Aeschylus are cast in heroic mould; his lofty earnestness and magnificent imagery make him one of the most sublime of the world's poets. Before the time of Aeschylus the action of a play was evolved from the dialogue between the chorus and a single actor. Aeschylus introduced a second actor, thus rendering practicable dramatic possibilities hitherto unthought of. There are English verse translations of the plays by E. H. Plumptre, Lewis Campbell, and Gilbert Murray. Consult Aeschylus, Creator of Tragedy, Gilbert Murray, 1940.

Aesculapius. Roman, and better known, name of the Greek god Asclepius. In classical mythology he was the god of medicine, though Homer speaks of him as a mortal. The son of Apollo and Coronis, he was a pupil of the centaur Cheiron. By his knowledge of the healing art he was able to restore the dead to life, and his use of this power aroused the anger of Zeus, who killed him

with a thunderbolt. In later times the chief seat of his worship was Epidaurus, where his temple served the purpose of a modern hospital. A guild called the Asclepiadae, of which Hippocrates was a member, was formed of his supposed descendants. The symbol of Aesculapius, a staff with a serpent twisted round it, is the badge of the R.A.M.C.

Aesculin. Glucoside discovered by Minor in 1830 in the bark of the horse-chestnut, *Aesculus hippocastanum*. In aqueous solution it exhibits a beautiful blue fluorescence which disappears on adding an acid. With nitric acid a yellow solution is formed which turns to a characteristic blood-red colour on adding ammonia.

Aesica. Roman stationary camp at Great Chesters, on the line of Hadrian's Wall, Northumberland, England. It was occupied by the second cohort of an Iberian legion recruited from Asturias. Water was brought from the Caw Burn along an open channel 6 m. long. Two exquisite late-Celtic bronze brooches, now in the British Museum, were found there.

Aesir. Plural of As and the collective name for the chief gods of Norse mythology. They included Thor, Baldr, Njörd, Frey, Loki, who with Freyja and other goddesses dwelt in Asgard (home of the gods). They waged war against the powers of evil and were themselves threatened with

Aesop, famous Greek fabulist
Bust in Villa Albani, Rome

destruction by Ragnarok, the twilight of the gods.

Aesop (c. 620–560 B.C.). Traditional author of the famous collection of fables. A native of Phrygia and originally a slave in Samos, he is said to have won the favour of Croesus, king of Lydia, who employed him on important missions. One of these was to Delphi, and Aesop, giving offence to the

Delphians, was thrown over a precipice. Tradition represents him as very ugly but very witty. The fables in Greek verse by Babrius (3rd century A.D.) and in Latin verse by Phaedrus (q.v.) contain translations or adaptations of many fables ascribed to Aesop.

Aesthetics (Gr. *aisthetikos*, perception). Body of mental concepts leading to a theory of beauty. The term Aesthetic is defined in the Oxford English Dictionary as "the philosophy or theory of taste or of the perception of the beautiful in nature and art." One of its purposes is to define the beautiful and to analyse the attitude to it of the human mind. The beautiful in its essence is a theme for the professed philosopher, though its concrete manifestations in nature and art appeal to the general intelligence.

Response to the perception of beauty does not move a person to action, but is contemplative, harmonious, restful, and disinterested in the sense that to enjoy beauty we do not monopolise—as in the pleasure of eating, for example—but share with others the satisfaction it affords. Objects which provide aesthetic satisfaction are in several categories, e.g. beauty in the ordinary sense, the sublime, the characteristic, and even the ugly.

What is presented in the arts affects us essentially in the same manner as the aesthetic material presented by nature, though there are differences, e.g. a great building may impress the beholder by its sublimity,

Aesculapius. Votive panel representing the god of healing, his daughter Hygieia, and two worshippers
National Museum, Athens

as does a mountain cliff, but it is also to be appreciated as a purposeful work of human hands. The discussion of the beautiful in art has for its practical end the establishment of a basis for art criticism, and this is sometimes called practical aesthetic. It concerns itself with the purely artistic qualities of form, design, and technique, as distinct from utilitarian purpose, not only in architecture, painting, sculpture, ornament, etc., but in poetry, drama, and other creative literary arts—although the modern development in the perception of the beauty that is inherent in fitness for purpose, has made the purely aesthetic qualities of, for example, architecture, more difficult to isolate. The devotees of "functionalism" derives equal aesthetic satisfaction from the contemplation of the lines of a sailing yacht or of a steel girder bridge like the Forth Bridge, and those of a factory building well planned for its purpose, or even a well-white-washed wall, all of which are entirely functional in purpose, the beauty being incidental.

Art concerns itself not only with the product, but with the conditions of production, the psychology of the artist, the character of the impulse from which artistic activity proceeds. This activity, like the appreciation of the beautiful, is an unconstrained ideal activity of a disinterested kind in that it is an end in itself. The only reason for indulgence in conscious and unrestrained artistic activity is that the agent takes pleasure in it. To define the nature of this pleasure is one of the problems of aesthetics, and no theory yet commands general assent. *See also* Architecture; Art; Criticism; Design; Drawing; Painting; Sculpture, etc.

Bibliography: History of Aesthetic, B. Bosanquet, 1892; The Sense of Beauty, G. Santayana, 1904; Essence of Aesthetic, B. Croce, trans. Ainslie, 1918; The Theory of Beauty, E. F. Carritt, 1923.

Aestheticism. In its full and strict sense, the practice of the theories of aesthetics. The word was popularised in the latter half of the 19th century by a group of notable artists and craftsmen, including Dante Gabriel Rossetti and William Morris, who revolted against the general ugliness of Victorian architecture, art, decoration, and furniture, and strove to educate public taste to appreciate better things. The movement they started was carried to ex-

tremes by younger men of brilliant wit but not impeccable judgement, among whom Oscar Wilde was chief, and aestheticism came to connote an affectation which was killed by ridicule. The Gilbert and Sullivan opera *Patience*, 1881, and George du Maurier's satirical drawings in *Punch*, assisted in the kill.

Aestivation (Lat. *aestivare*, to pass the summer). In zoology, the summer sleep of animals, resembling the more common hibernation, or winter sleep. It is seen chiefly in molluscs and freshwater fish, which are enabled by it to endure a dry condition.

The African mud fish (*Protopterus*) inhabits streams which dry up in the summer. The fish then forms a kind of cocoon in the mud, in which it coils up and goes to sleep until the rainy season returns. Land snails retire in dry weather into the ground or sheltered crevices, where they secrete an epiphragm or thin film over the aperture of the shell to prevent evaporation. They then become dormant until rain again brings them out.

Aetas. Aboriginal inhabitants of the Philippines. They are frizzy-haired, round-headed, broad-chested, and long-armed negro hunters, about 4 ft. 6 ins. tall. They use bamboo spears and poisoned arrows, wear breechcloths, erect rude shelters, and preserve a primitive culture and low animism. *See* Negrito.

Aethelred. Alternative spelling of the name of two Anglo-Saxon kings of England. *See* Ethelred. Similarly, except Athelstan, generally spelt thus, other Saxon names beginning with Ae will be found under E.

Aëtius (d. A.D. 454). Roman general under Valentinian III, Roman emperor of the west. He defended the frontiers of the Empire for nearly 20 years, and in 451 defeated Attila near Châlons. His son was betrothed to Valentinian's daughter, but in 454 the emperor, suspecting that Aëtius had designs upon the throne, killed him.

Aetolia. District of ancient Greece. It was bounded S. by the Gulf of Corinth, W. by the river Achelous, N. by Epirus and Thessaly, and E. by Locris and Doris, and is now included in the modern Greek nome or prov. of Acarnania and Aetolia. Almost wholly mountainous its people were hardy, warlike, and turbulent. After 146 B.C. Aetolia was included in the Roman prov. of

Achaëa. In the 13th century it passed to a Byzantine prince, in the 15th to Scanderbeg and Venice, and later to Turkey. Aetolia produces currants, wine, tobacco, and maize. It is rich in remains of ancient fortifications. Chief towns, Missolonghi and Lepanto. *See* Acarnania.

Aetolian League. Federation of Greek cities after the death of Alexander the Great. Originally based on Aetolia, the conquest of Boeotia in 245 B.C. gave it control over the whole of central Greece. Threatened by the Macedonians and the Achaean League, the Aetolians allied themselves with the Roman invaders, only to be disappointed in their hopes, for war with Rome followed, and from 189 B.C. the Aetolian League was little more than a name. *See* Achaean League; Greece.

Afar. Hamitic tribes of East Africa. *See* Danakilis.

Affection (Latin *afficere*, to affect). In psychology, a mental condition characterised by disturbance differing in kind and degree, the result of sudden or violent impressions. Formerly, affections were regarded as sensations, but are now considered to be conscious processes set up by stimuli (forms of excitement), not limited to particular organs of the body. *See* Psychology.

Affettuoso. Musical term, derived from the Italian, and meaning lovingly, feelingly.

Affidavit (Lat. he has sworn). In English law, a statement put into writing, and then sworn to and signed by the witness, who is called the deponent. The oath may be administered by any person who has authority to administer oaths in the court where the affidavit is to be used, usually a commissioner for oaths: or, abroad, by a British consul. J.P.s and registrars of county courts have also power to swear deponents in some circumstances. The deponent attends before the commissioner, signs the affidavit, and the commissioner repeats the words: "You swear that this is your name and handwriting, and the contents of this your affidavit are true, so help you God." The deponent may affirm, if he wishes, instead of swearing. At the trial of an action, facts must usually be proved by calling witnesses, but the court has power to order facts to be proved by affidavit unless a witness is reasonably desired and can be produced. Affidavits are, however, used in interlocutory proceedings other than trials.

Affiliation (Latin *ad*, to; *ilius*, son). Legal term meaning the fixing of the paternity of a bastard child. Proceedings may be taken against the man by the mother or a local authority or the national assistance board in a magistrate's court. They must be begun before the birth or within 12 months thereafter; and, upon paternity being proved, the magistrate may order the father to pay a sum to cover lying-in expenses, and not exceeding 10s. a week until the child is aged 16.

Affinity (Lat. *affinis*, related). Biological term to express an existing relationship or connexion between different species of animals or plants, pointing to a more or less common origin. It is estimated by the resemblance of structural characters, not by functions. Thus, a similar structural basis of a fore-limb points to affinity between the two animals concerned, irrespective of whether that limb be used for flight or other method of locomotion. It is an evidence of relationship.

In chemistry, affinity is the attractive force which causes elements or their compounds to unite with other elements to form new compounds. The name chemistry has been proposed for it.

In English law the term is used to describe relationship between the husband and his wife's relatives, or the wife and the husband's relatives. Affinity is a bar to marriage in certain cases of blood affinity, i.e. between husband or wife and deceased wife's or husband's blood relatives. The table is set out in the Book of Common Prayer. Since 1907, English law has permitted the marriage of a man to his deceased wife's sister, since 1921 that of a woman to her deceased husband's brother, and since 1931 that of a man with his deceased wife's niece or aunt.

Affirmation (Latin *ad*, to; *firma*, firm). Solemn declaration made before a competent officer in place of a judicial oath. Any person who, on giving evidence, or upon any other occasions when an oath is required—e.g. on enlistment in the Army, or upon taking a seat in Parliament, when the oath of allegiance is required, or on giving evidence in a court of law—objects to be sworn, is allowed to make an affirmation instead. But he must give as his reason for objecting to an oath either (1) that the taking of an oath is contrary to his religious belief; or (2) that he has no

religious belief (Affirmation Act, 1898). By a Statute of 1833, Quakers and Moravians are allowed to affirm, and the Oaths Act of 1888 gave atheists, free-thinkers, etc., the same right. An affirmation, made as aforesaid, has the same force as an oath, a witness who affirms falsely being fully guilty of perjury. See Oath.

Afforestation. The raising of plantations of trees on land that is naturally bare or land that has not carried trees for a number of years. It is contrasted with the replacement of recently felled wood. The term may be extended to the replanting of areas of open inferior forest or of valueless scrubland. See Forestry.

Affray (Fr. *effrayer*, to frighten). In English law, a disturbance of the public peace on the part of two or more persons by acts of violence which, while not grave enough to constitute a felony, are yet of such a nature as to terrify peaceful citizens. Mere threats do not amount to an affray; there must be a blow given or a weapon drawn. Affrays are distinguished from the graver offence of rioting by the absence of any common unlawful purpose in the minds of the offenders. Thus, a sudden outbreak among persons lawfully assembled would be only an affray, at least in the first instance. But if the disturbance result in an organized raid or a faction fight, it becomes a riot.

Affreightment (Fr. *affrètement*, the hiring of a ship). Term used to describe the contract under which a shipowner agrees, for hire, to carry goods in his ship. The remuneration is called freight. When a shipowner lets the whole of his ship in one contract, it is called chartering the ship; the hirer is called the charterer; and the document is called the charter-party. A charter-party may be for a voyage or voyages, as for the round voyage to Rio de Janeiro and back; or for a period, as for a year, in which case it is spoken of as a time-charter. When the shipowner does not charter his ship, but carries goods for a number of persons, the contract of affreightment is called a bill of lading.

By the common law of England, founded, in this case, on old maritime custom common to all seafarers in Europe, a shipowner who agrees to carry goods in his ship is liable for their safety at all hazards, except: (1) Act of God. (2) Act of the king's enemies. (3) Loss occasioned by the in-

herent defect of the thing carried, as where a horse, while being carried, plunges and kicks and hurts itself; or where combustible goods, owing to the rolling of the ship, ignite, or where goods are defectively packed. But not where he has notice of the dangerous character of the goods, or their defective packing. (4) Where goods are jettisoned, i.e. are thrown overboard to lighten the ship when it is in danger.

For long, however, shipowners have introduced special clauses limiting very severely their Common Law liability. They may still include such clauses in any charter-parties and in bills of lading outside the Carriage of Goods by Sea Act, 1924. This Act applies only to shipments abroad from a port in this country. Special agreements may still be made for goods not "ordinary commercial shipments made in the ordinary course of trade." The present British law now conforms with the recommendations of an International Conference held at Brussels in 1922.

Affric. Glen, river, and lake of Inverness-shire, Scotland. The glen is considered to be the most beautiful in the U.K., and the river, 18 m. long, passes through it and the lake to join the Glass river.

Arfrontée (Lat. *ad frontem*, to the brow or face). In heraldry, the figure of a living creature, a skeleton, or a helmet placed full face.

Afghan Hound. Breed of dog, probably an offshoot of the Arabian Saluki. A hunting dog in its native country, the Afghan can be trained as a highly intelligent and companionable home dog

Afghan Hound. Dignified specimen of this breed of large dog
Photo, "The Times"

The usual height is 27 to 29 ins. The characteristic shock of silky hair on the top of the head and the contrast of short hair on the back with long hair on quarters and legs give it an appearance that is eccentric but dignified.

AFGHANISTAN: A BUFFER STATE

Evans Lewin, former Librarian, Royal Empire Society

A succinct description of this country and its turbulent history.

Other information will be found under the headings Amanullah; Herat; Kabul; Kandahar; Khyber Pass; North-West Frontier; Pandyah; United Nations, etc.

Afghanistan is a country lying N.W. of Pakistan and forming a buffer state between the U.S.S.R. and that dominion. It is bounded W. by Persia, N. by territory of the Turkmen, Uzbek, and Tadzhik S.S.R., and E. and S. by Pakistan; in the N.E. it touches Kashmir and China. Its length from the Persian frontier to the Khyber Pass is about 600 m., extreme breadth N. to S. about 500 m., estimated area 250,000 sq. m.

Ethnographically Afghanistan embraces the region between the rivers Oxus (Amu-Daria) and Indus, but its political frontiers enclose a smaller area. The E. and S.E. Afghans were conquered by the Sikhs, became either part of British India (e.g. N.W. Frontier province) or semi-independent communities (e.g. Chitral), and later joined Pakistan. Afghanistan's frontier with the U.S.S.R. follows the decisions of the Russo-Afghan boundary commission of 1884-86 and the terms of an agreement signed in 1948. The boundary runs N.E. from Zulfikar to the Amu-Daria, and is mainly of an artificial character, protected by fortresses. From Khamiab the Amu-Daria forms the frontier, which continues along the river Panjah into the Pamirs. Passing through a mountainous snow-covered region, it ends on the borders of China near one of the breaks in the Sarikol range. Bending sharply S. and thence W., the boundary runs roughly parallel with the Panjah for about 50 m. and encloses a strip of territory known as Wakhan, dividing the Pamirs from Chitral. From this point S. the frontier is purely strategic.

Scientific Frontier

After the Afghan War of 1878 the scientific frontier, so termed by Lord Beaconsfield, was established so that the ameer's dominions should not include the semi-independent Pathan tribes in the hills N.W. of India. In 1893 a delimitation was agreed upon. Chitral, Bajaur, Swat, and Waziristan were recognized as within the British sphere of influence, while Kafiristan continued under Afghan control. The frontiers S.W. from the Khyber Pass are mainly deter-

mined by tribal and geographical considerations until a point S.W. of Quetta is reached. Here the boundary strikes due W., crosses the Helmand desert, and reaches Persia at the Koh-i-Malik-Siah, from which mountain it runs approximately due N. and is mostly undefined.

Afghanistan is mainly mountainous, broken by deep ravines and fertile valleys. From the N.E. it is crossed by the lofty ranges of the Hindu Kush, the W. continuation of the Himalayan system, striking off from the Pamir plateaux. Here peaks reach 24,000 ft. in height. The Hindu Kush, with its W. continuation, forms the backbone of Afghanistan and divides Afghan Turkistan in the N. from the Helmand desert regions in the S. Of the mountain passes, upwards of twenty in number, the Kushan Pass in the Hindu Kush is 14,350 ft. up, and few are below 12,000 ft. Numerous rivers rise in these ranges or enter the country from the N. They include the Amu-Daria; the Murghab, which rises in the Fruz Koh and runs N. through the city of Merv; the Helmand, rising in the Hindu Kush and flowing 680 m. S.W. into Lake Hamun; the Hari Rud, rising in the Hindu Kush and flowing 500 m. W. into Persia; and the Kabul, which joins the Indus at Attock. There are numerous small lakes, the most important being the Ab-i-Stada in Ghilzai.

INDUSTRIES AND COMMUNICATIONS. Generally healthy and dry, the climate is marked by extreme variations of temperature. For example, whereas at Kabul and in the N. the winter is severe, at Jalalabad it is almost as mild as in India. In all parts the heat is great during summer. In the S. and E. districts there are two harvests. The spring crop consists of wheat, barley, and lentils; the autumn harvest produces rice, millet, sorghum, tobacco, beet, and maize. All European fruits, especially grapes, are grown, and an extensive trade is carried on in these products. In the warmer districts, sugar-cane and cotton are grown. Copper, iron, and gold are worked. Silver was at one time plentiful. Gypsum, petroleum, asbestos, sulphur, and

lapis lazuli occur. Of manufactured articles, silk and carpets are the chief; Herat is a depot for the carpets of Central Asia. Kabul and Kandahar have factories, while hydro-electric schemes are being set up under government supervision. Reliable trade statistics are not available, but exports for 1945-46 were valued at £13,740,000, four-fifths of which was with India (and Pakistan). Textiles, cement, machinery, tea, coffee, cocoa, and drugs are the chief articles of import; wool and skins of fat-tailed sheep, cattle, horses, fruit, silk, and carpets the principal exports. Domestic animals include camels, goats, and dogs.

The lines of communication are through the valleys and across the mountain passes. The most important of all the frontier routes are those connecting the Amu-Daria regions and the highlands of Central Asia with Kabul, and those leading from Kabul to the plains of India. From Russia to Herat there are four distinct lines of advance: from the Caspian by the route through Meshed; from Chikishliar, on the Caspian, to Merv; from Tashkent; and through Balk in Afghan Turkistan. Herat and Dehdadi, near Balk, form the strategic keys to N. Afghanistan.

Four Famous Passes

Connecting with Pakistan there are four principal lines of communication: from Peshawar through the Khyber Pass leading to Jalalabad and Kabul; from Bannu over the Peirwar Pass to Kabul; through the Gomal Passes to Ghazni; and from Quetta through the Bolan Pass to Kandahar. This last is one of the world's great strategical positions, and is connected with the Indian railway system. A line has been carried through the Khwaja Amran range to the Afghan borders at New Chaman, where it opens on the route to Kandahar. Farther E. main rlys. run to Jamrud at the entrance of the Khyber Pass.

POPULATION AND GOVERNMENT. Afghanistan, with a population estimated at 10,000,000, is inhabited by a variety of nationalities, generally spoken of as Afghans, though properly only the Durani, one of the two dominant tribes, are Afghans. The other principal races are the Ghilzai, Hazaras, Tadzhiks, Uzbeks, Aimaks, and the Kafirs of the Hindu Kush. The languages are Persian, spoken by a large part of the non-Afghans,

1 Party of Baluchis from the Bolan Pass, bargaining in Quetta 2 Group of Brahuis, hill people of the southern frontier 3 Camel train in the Khyber Pass a formidable dchle 33 miles in length

on the Indo-Afghan frontier. 4 One of five colossal statues of Buddha in the Bamian Valley, between Kabul and Turkistan, they are carved out of the solid rock 5 Street in old Kabul

and Pushtu. Their religion is Mahomedan, chiefly of the Sunni sect. Until the creation of Pakistan, Afghanistan was, after Turkey, the most powerful Muslim state. Such education as exists is supplied by the village mullah or priest.

The Afghans as a rule form small village communities, but there are certain towns noted in history, or of importance as strategic points. The principal are Kabul, the capital, 6,396 ft. above sea level, in the E.; Herat, the chief town in the W.; Kandahar, the chief city in the S.; and Mazar-i-Sharif, Ghazni, Jalalabad, Kun-

good roads, and the strategic importance of the mountain passes, together with the fact that the warlike clansmen are armed with modern rifles.

Afghanistan is divided into seven major provinces: Kabul, Mazar, Kandahar, Herat, Kataghan, Simat-i-Mashriqi, Simat-i-Junubi, and three minor provinces. Each is under a governor termed Naib or Hakim. All governors are responsible to the king, and the provinces are subdivided into districts under nobles and judges.

HISTORY. The Afghans of the Durani clan claim to be the Beni-Israel and descendants of the

Subuktijin the Turk conquered it, and established himself at Ghazni. His son, the famous Mahmud of Ghazni, invaded India, and conquered Lahore and Delhi. The hordes of Genghiz Khan, about 1220, and those of Timur, in 1398, overran Afghanistan and displaced the native dynasties. Baber, the Mogul emperor, is buried at Kabul. With the decline of the power of the Mogul court at Delhi, Afghanistan fell under the sway of Persia.

The modern history of the country dates from about 1747, when Ahmad Khan, a general of the Saddezzai family, seized Kandahar. With the extension of Russian power in Central Asia, and the growth of British influence in N.W. India, the position of Afghanistan became of great strategic importance. The ameers intrigued with the Russian and Indian governments, and in 1839, Dost Mahomed having entered into negotiations with Russia, Afghanistan was invaded by a large British force, and the ameer was sent as a prisoner to India. Thenceforward the relations of Afghanistan with India were dominated by one main consideration—the position of the country in view of a possible Russian invasion of India.

The British occupation of Kabul led to an insurrection in 1841, when Sir Alexander Burnes and his suite were assassinated. In the following Jan. the British army retreated from Kabul, and was completely annihilated with the exception of one survivor. Two British forces went to avenge the massacres, and Kabul was captured on Sept. 16, 1842.

Dost Mahomed, again called to rule the Afghans, proved a valuable British ally during the Indian Mutiny. He died in 1863, appointing Shere Ali, his third son, as successor. In 1878, Shere Ali having intrigued with Russia and declined to receive a British mission, a British force invaded Afghanistan. (See *Afghan Wars*.) Shere Ali retired to Balk, and died at Mazar-i-Sharif Feb. 21, 1879. By the treaty of Gandamak (May 26), it was agreed that Shere Ali's son, Yakub Khan, should be recognized as ameer, and that a British representative should reside at Kabul; and the extension of the British frontier by the occupation of the Khyber Pass and the Kurram and Pishin valleys was secured. Sir Louis Cavagnari proceeded as British resident to Kabul, but there

duz, Balk, Maimana, Tash Kur-gan, and Faizabad.

Afghanistan is now a constitutional monarchy, with a parliament consisting of a senate (45 members nominated by the king) and a national assembly (138 elected members). The old title of ameer was discarded in favour of that of king in 1926. The nobles or chiefs are of three kinds: sirdars, khans, and mullahs. The sirdars are the hereditary nobility; the khans are the chosen representatives of the people; the mullahs are the Mahomedan priests and teachers. The revenue of the country is subject to marked fluctuations, and averages £4,600,000 per annum. The permanent army is stated to number about 90,000 men, but the force can be indefinitely expanded. The chief military strength of the country is its rugged and inhospitable nature, the absence of railways, or even

tribes carried out of Palestine into Media. Their language, however, does not support this claim. Before the Mahomedan invasions, Afghanistan was the centre of powerful Buddhist kingdoms. In the time of Darius Hystaspes, 515 B.C., it was included in the Achaemenian satrapies. Alexander the Great, in 329 B.C., crossed the mountains of the Paropamisus (Hindu Kush) and marched into Bactria, and in 327 he crossed the Indus, near the modern Attock, and invaded India. Many remains of Hellenic civilization are to be found in N. Afghanistan and in adjacent parts of Pakistan.

From the end of the 10th century, Afghanistan formed the principal highway of the Muslim invasion of India. The Hindu princes who had established themselves at Kabul were forced to abandon the country. In 977

on Sept. 3, 1879, he and his companions were assassinated.

The ameer, Yakub Khan, was forced to abdicate, and in July, 1880, Abd-ur-Rahman Khan, grandson of Dost Mahomed, was recognized as ameer. In the meantime, Ayub Khan, a brother of the late ameer, marched upon Kandahar, and on July 27, 1880, the battle of Maiwand (*v.r.*) occurred. Eventually, Ayub Khan, totally defeated, fled to Persia on Oct. 4, 1881, leaving Abd-ur-Rahman as the sole ruler of Afghanistan. Abd-ur-Rahman reigned until Oct. 1, 1901, when he was succeeded by his son Habibullah Khan. In the Anglo-Russian Treaty of 1907 Great Britain undertook not to annex Afghanistan and the Russian government declared the country to be beyond the sphere of Russian influence.

In 1915 the German government sent a mission to Afghanistan to incite the ameer to assist in liberating India. The ameer firmly refused the inducements held out to him to forsake his British ally. He was assassinated on Feb. 20, 1919, and the throne was seized by his brother, although the rightful heir was the eldest son of the former ameer. Even after the accession of Amanullah, third son of Habibullah, the country remained unsettled, and in May armed bodies of Afghans crossed the Indian frontier (*see* Afghan Wars). In 1929, Amanullah, whose western ideas were repugnant to his countrymen, abdicated in favour of his brother, Inayatullah Khan, who, however, was forced to abdicate. Habibullah, a brigand chieftain, seized the throne, but was subsequently defeated and executed by Nadir Khan, who became king. The latter was assassinated in 1933, when Mahomed Zahir Shah (b. 1914) succeeded his father Nadir.

Afghan Wars. The extension of the British dominion in India, coupled with fears of Russian aggression, led to wars between Great Britain and Afghanistan in 1839-42 and 1878-9. A further war broke out in 1919.

In 1839 Great Britain decided to restore the ex-ameer, Shah Sujah, whose place on the throne had been taken by Dost Mahomed. Under Sir John Keane an army marched through the Bolan Pass, entered Kandahar, and saw Shah Sujah crowned. The only serious resistance came from the fortress of Ghazni, but on July 21 it was successfully stormed.

In 1841 seven British officers were murdered in Kabul, and on Jan. 6, 1842, the garrison, which included 8,000 Anglo-Indian troops, surrendered on condition that they were allowed to return to India. A treaty was signed and the retreat began. In a pass between Kabul and Jalalabad all the troops and their followers, 16,000 men, women, and children, were overwhelmed and murdered, one man alone, Dr. Brydon, escaping. The Afghans followed the way to India, but General Sale held Jalalabad against them. An Anglo-Indian army forced the Khyber Pass, relieved Jalalabad, and in Sept. occupied Kabul, where it was joined by a column from Kandahar, which the British garrison had refused to surrender. At the end of the year Afghanistan was evacuated.

Shere Ali and Russia

In 1875 the British Government, alarmed for the safety of the Indian frontier, requested Shere Ali, the ameer to allow a British agent to reside at Herat. After some negotiations he refused, and in July, 1878, signed a treaty placing Afghanistan under the protection of Russia. The viceroy sent a mission to Afghanistan, but this was not allowed to enter the country, and war followed.

In Nov., 1878, three Anglo-Indian armies took the field. One entered Kandahar; a second occupied Jalalabad; but the third, under Roberts, reaching Kuram without opposition, there found an army of Afghans in a formidable position on the Peiwar Kotal. Roberts led a force round the enemy's flank, and on Dec. 2 drove them in headlong flight. On May 26 the treaty of Gandamak granted the British demands.

On Sept. 3 following, Sir Louis Cavagnari, the British representative at Kabul, and his staff were murdered. Roberts, sent there at once with an army, defeated the Afghans and entered Kabul. He remained there for nearly a year, engaged in almost constant hostilities. In July, 1880 a British force met with disaster at Maiwand, near Kandahar, and there followed

the siege of the British garrison in that city. Roberts was ordered to avenge the loss, and with 10,000 men, marching over 300 miles in three weeks, he defeated the Afghan army outside Kandahar on Sept. 1. British prestige was restored, and Abd-ur-Rahman, the candidate favoured by the Anglo-Indian authorities, eventually became ameer.

In May, 1919, Amanullah Khan began a campaign against the British, his troops crossing the frontier at several points in the Khyber Pass district.

Having seized three points in the hills N. of the Khyber, the Afghans advanced to Ashrafi Khel, and threatened Landi Kotal. Sir Arthur Barrett, commanding the British forces on the frontier, drove the enemy from the neighbourhood on May 9, and marching into Afghan territory occupied Dakka Fort, 10 m. N.W. of Landi Kotal. On May 16 the Afghans attacked Dakka in force, but were repulsed. Next day they were again defeated on the hills W. of the fort. On May 21 Jalalabad and Kabul were bombed from the air. The Afghans started an offensive in the Tochi and Gomal valleys, and a force of 3,500 Afghans attacked Thal Fort in the Kurram Valley, but these efforts failed. Amanullah made overtures for peace; a conference was held on July 26 at Rawalpindi, and peace was concluded on Aug. 8, the ameer forfeiting the subsidy of £120,000 a year which the Indian government had previously paid.

Afmadu. Town in the former Italian Somaliland, 100 m. E. of the Kenya border. After severe bombing raids by the South African Air Force, the Italians evacuated the town on Feb. 10, 1941, and fled towards Kismayu. Afmadu was occupied by the King's African Rifles on Feb. 11.

A fortiori (Lat. from the stronger). Form of argument in which it is assumed that what has been found true or applicable to certain cases is with all the more reason true or applicable to the case under consideration. It may be thus expressed mathematically: if B is greater or less than C, and A is greater or less than B, much more then is A greater or less than C.

Afranins, LUCIUS (c. 100 B.C.). Roman comic dramatist. He wrote *comœdiæ togatæ*, comedies dealing with Roman manners, as contrasted with those of Plautus and Terence, whose plots were more or less taken from Greek sources. Fragments of his writings survive.

AFRICA: ITS LANDS, PEOPLES, AND HISTORY

EVANS LEWIN. Author of *A Geography of Africa*

This general article is introductory to others on separate aspects of the continent, e.g. Abyssinia, Congo, Egypt, Nile, Rhodesia, Sahara, South Africa, Zambesi. For African campaigns in the Second Great War see East Africa Campaign, North Africa Campaign, and articles on particular regions and towns

This great continent of the eastern hemisphere forms a S.W. extension of Asia, to which it is attached by the isthmus of Suez. It is of irregular triangular shape, with its base resting upon the Mediterranean and Red Sea and its apex at the junction of the Indian and Atlantic Oceans at Cape Agulhas, Cape Province of South Africa. From the northern point of Tunisia (Cape Blanco) to Cape Agulhas it stretches southwards about 5,000 m., and is divided into two almost equal parts by the Equator. The extreme W. and E. points are Cape Verde, in Senegal, and Cape Guardafui, on the coast of Somaliland at the entrance to the Gulf of Aden, about 4,000 m. apart. The total area of the continent is about 11,500,000 sq. m., and the estimated pop. is some 180,000,000.

GENERAL CHARACTERISTICS. With the exception of Australia, Africa is the most regularly shaped of the continents. With few exceptions there are no deep indentations into the coasts, and there are comparatively few bold headlands. The principal capes are Bon and Blanco (Tunisia). Sparte (Morocco). Verde (Senegal). Lopez (Gabun), Cape of Good Hope and Agulhas, and Guardafui; and the chief natural harbours are the Gambia estuary, Freetown (Sierra Leone), the Cameroons estuary, the mouth of the Congo, Lobito Bay (Angola), Walvis Bay (South-West Africa), Table Bay and Simon's Bay (False Bay); Delagoa, Mokambo, Momba, and Pemba Bays, in Portuguese East Africa; Kilwa, Dar-es-Salaam, and Tanga, in the former German colony of East Africa (Tanganyika), and Mombasa and Kilindini harbours, in Kenya. Long stretches of the coast have no natural openings, e.g. the greater part of South-

West Africa, and others are provided only with indifferent anchorages, e.g. Morocco to Cape Verde and the coast of Somaliland. Although about three times the size of Europe, the littoral is about 1,000 m. shorter.

The whole of Africa may be regarded as a vast plateau or inverted plate, at an average elevation of 1,300 ft. in the northern half and from 3,000 ft. to 3,500 ft. in the southern portion. Despite a certain general uniformity, the northern and southern portions of Africa present sufficient contrasts in their main physical conditions, ethnographical features, historical evolution, and general culture, to constitute two practically distinct regions. But there is no rigid partition between the two divisions, which are joined together, roughly speaking, by the Tibesti route across the Sahara, the low-lying valley of the Nile, and the Abyssinian massif, and divided by the great land-mass of the Sahara, the

Sudd regions of the Nile, and the desert-like country S. of Abyssinia.

The mean elevation of the continent is considerably less than that of Asia, and its highest elevation is much inferior. The area of land above 10,000 ft. in height is insignificant, although about one-fifth of the continent lies 3,000 ft. above sea level. Orographically it may be divided into four regions: (1) the coastal plains, commencing with extensive mangrove swamps, or lagoons, as on the Gulf of Guinea, the coasts of Mozambique and old German East Africa, or sandy regions, as along the coasts of N.W. Africa from Mogador to Sierra Leone, the coasts of W. Africa from Benguela to Saldanha Bay, and the coasts of E. Africa from Mombasa to Suez, rising, generally gently, to the interior highlands; and the more abrupt coastlands of Algeria, Morocco, and S.E. Africa, with their backgrounds of considerable mountain groups; (2) the Atlas region of N. Africa; (3) the north and west African plains, including the Sahara; and (4) the great southern and eastern tablelands.

The Atlas region is a mountainous tract of land lying north of a valley-like depression which extends from the Gulf of Gabes, roughly, to the Rio de Oro. The north and west African plains may be considered to embrace the comparatively low-lying area south of the Atlas, and, stretching southwards across the continent, to include the basin of the Congo. This area includes three great desert regions. It is crossed from N.W. to S.E. by a series of elevated plateaux and mountain groups, including the Hoggar or Ahaggar massif.

In Western Africa the area is broken by elevated regions consisting of the Futa Jalon highlands and their offshoots,

Africa. Woman and children of Manica, Portuguese E. Africa

Africa. Arabs with their camels in the Tunisian desert. The ridges formed by wind-blown sand are clearly seen in the foreground

forming the hinterland of the West African colonies and extending, with breaks, through N. Nigeria to the mountainous region of Adamawa.

The fourth great division, consisting of the south-eastern tableland, has a greater mean elevation than any other portion of Africa. It stretches in a widening area from the Abyssinian highlands southwards, through the Great Lakes district, into southern Angola on the one side and Mozambique on the other, to the extremities of the Cape Province and Natal. The eastern portion has been modified by great rift valleys, starting from Lake Nyasa and branching east and west at a point north of the Abercorn portion of the Tanganyika plateau. The first of these depressions, the Eastern trough or rift valley, runs northward across old German East Africa and British East Africa to Lake Rudolf, and then turns N.E. to the Red Sea, which in reality itself forms a still larger rift valley and owes the straightness of its shores to this fact. The second, the Central African or Albertine rift valley, includes Lake Tanganyika, with its comparatively straight and high shores, and Lakes Kivu, Edward, and Albert, and terminates N. of the last lake and S. of the Nile. Volcanic action has been associated with the formation of these rifts.

Associated with these valleys are peaks E. of the Eastern trough,

such as Kilima-Njaro and Kenya, and the great ranges of Mfumbiro and Ruwenzori, the latter with heights of 16,800 ft., lying E. of the Albertine rift valley. Many of these mountains are still active volcanoes, especially those in the Mfumbiro range between Lakes Kivu and Edward. In the centre, between the two valleys, lies Lake

Africa. New style of native house built of wattle and daub in the Congo district. Healthier, cleaner and more comfortable than the old-style grass huts

Victoria. The descent from the central tablelands to the North African plains is abrupt, the Somerset Nile descending in about 90 m., over the Ripon and Murchison Falls, from 3,800 ft. to 2,400 ft. Southwards the central tableland becomes highest in its southern and south-eastern regions, where it culminates in the

Drakensberg Mountains, which form a N.E. extension of the mountains rising behind Cape Town. This South African tableland slopes gently to the west, but more abruptly on the eastern side, especially in Natal. There are heights of 10,360 ft. (Mont-aux-Sources).

The main mountain buttress in South Africa runs, like the coast, in a semicircle. At the N.W. end of the Cape province it is called the Kamiesberg and rises to over 5,000 ft. It is then continued in a S.E. direction as the Langeberg, Kamiskow, and Bokkeveld Mts. This system then turns and runs E. as the Roggeveld, Komsberg, and Nieuwveld Mts., and then bearing N.E. continues as the Sneeuwberg and Stormberg ranges until it merges in the Drakensberg Mountains

RIVERS AND LAKES. Africa is mainly drained to the west and north, or towards the Atlantic and Mediterranean. Eliminating the Sahara Desert, about two-thirds of the continent drains towards the Atlantic. The rivers may be divided into four main systems, as follows:

(1) Those that flow into the Mediterranean. With the exception of the Nile, all these rivers are short and unnavigable, the principal being the rapid Medjerda, which drains Tunisia. Certain other rivers, such as the Igharghar, which at one time flowed from the Hoggar region of the Sahara, have either dried up or remain as intermittent streams. The Nile (3,500 m. long) issues from Lake Victoria and forms the main drainage system of the Ruanda, Uganda, and Abyssinian regions. The Blue Nile rises in the Abyssinian highlands.

(2) Rivers flowing into the Atlantic. Many extensive rivers, north and west of the Niger delta,

Africa. Part of a convoy of natives bearing elephants' tusks, the raw material of the ivory of commerce. African ivory is regarded as the best

flow into the Atlantic, including the Gambia and the Senegal. The Niger forms the great drainage system of Western Africa, and, receiving many tributaries, such as the Kaduna and Benue, enters the Gulf of Guinea in Southern Nigeria, after a circuitous course of some 2,000 m from the high lands of Futa Jalon. The Congo the principal river of Africa, with a drainage area of about 1,425,000 sq m, only inferior to that of the Amazon, drains with its great tributaries the Ubangi, Kasai, Lomami, etc., the greater part of Central Africa, including Lake Tanganyika and the regions E thereof as far as Labora, and Lakes Mwari and Bangweulu. Other rivers flowing into the Atlantic S of the Congo are the Kwanza, Kunene, and Orange river (receiving the Vaal and other rivers draining from the Drakensberg), and N of the Congo, the Sanaga, Nyong, Ogowe, Nyanga and Kuilu.

(3) Rivers flowing into the Indian Ocean. The principal rivers draining into the Indian Ocean are the Limpopo, Sabi, Zambezi, Rovuma, Rufiji, Tana, and Juba. Of these by far the most important is the Zambezi, which drains the greater part of Rhodesia and portions of southern Angola, and the Nyasa region by the Shire affluent of Lake Nyasa.

(4) Inland drainage. In addition to the rivers entering the sea there are others either (a) draining into lakes or (b) losing themselves in the sand, such as the Gash river in the Kassala district of the Anglo-Egyptian Sudan. Of the former the principal are the Shari

with its tributary the Logone, which flows into Lake Chad, and certain rivers flowing into Lake Ngami. In the case of rivers with no exits, underground water supplies are formed, which by means of artesian wells are brought to the surface, as in the Wad Rhir

Africa. African boys, in their simple attire, and one of their village wine jars

region of Algeria. It is probable that vast underground supplies of water exist in many parts.

The interior lake system is only inferior to the North American system. In addition to the great lakes, such as Victoria, Albert, Edward, Kivu, Tanganyika, and Nyasa, of East Central Africa, there are numerous other lakes, with fresh or brackish water, such as Bangweulu and Mwari in north-eastern Rhodesia, Rukwa in old German East Africa, Leopold II and Tumba in the Belgian Congo, Rudolf and Stephanie, and the so-called Lake Magadi, with extensive soda deposits in British

East Africa, and Lakes Chad and Ngami, the last being now mainly an immense swamp. In addition there are extensive depressions, such as the Lorian swamp in British East Africa, the Okavango swamps, the Lake No and Sudd regions of the Nile, which after rains become great swamps.

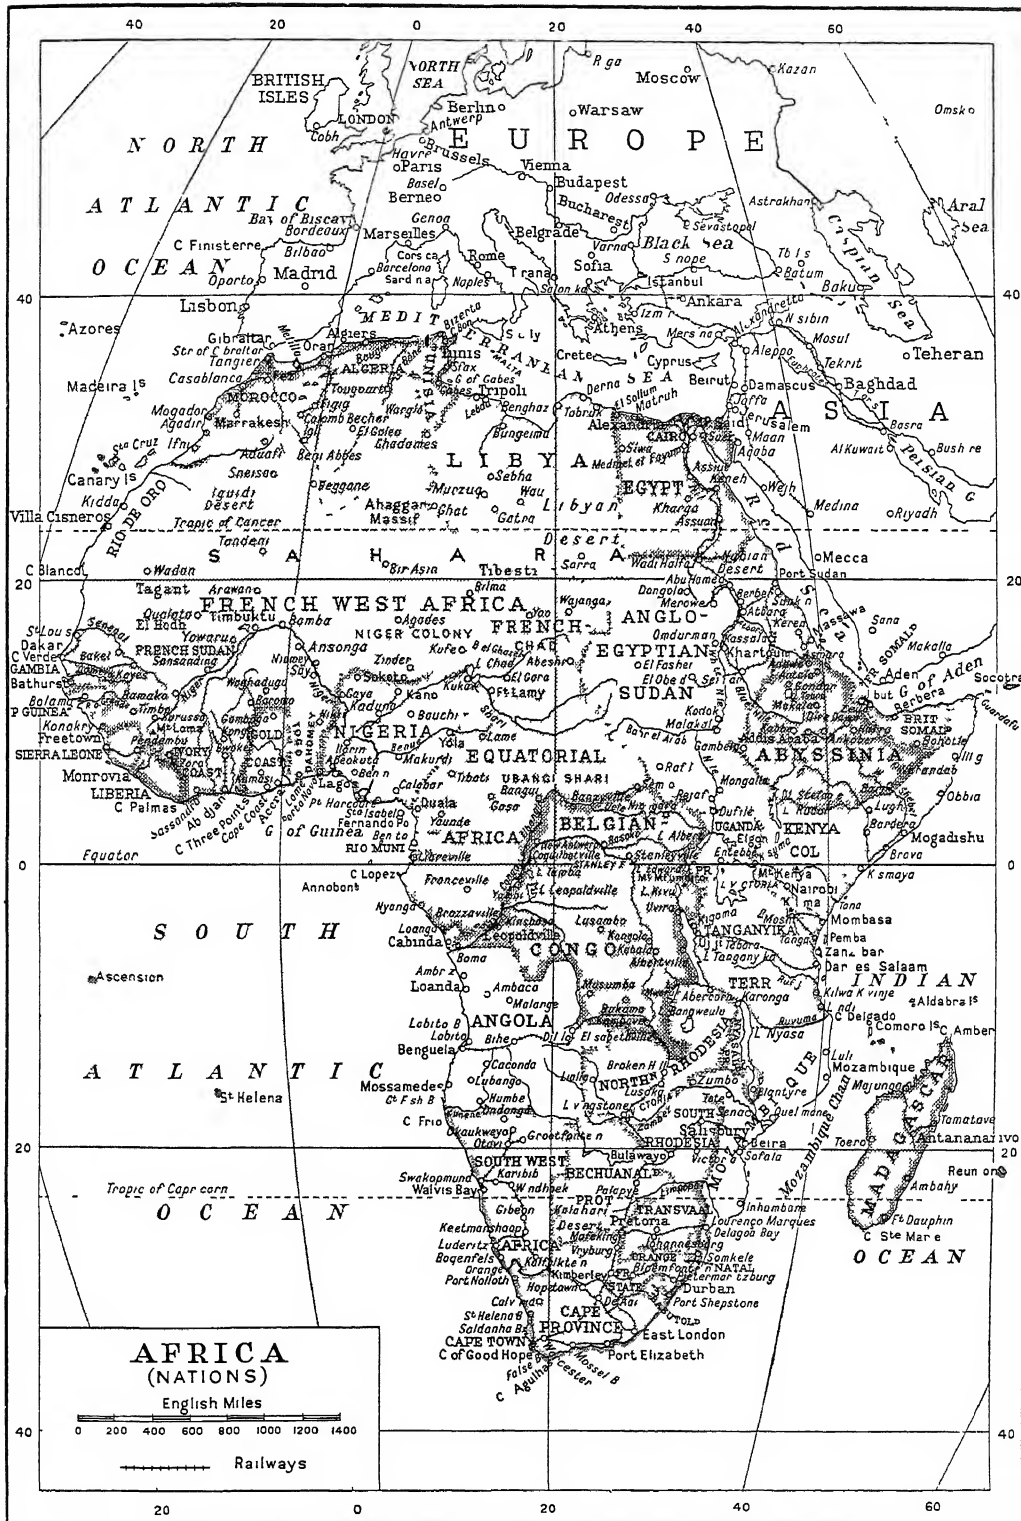

DESERTS In historical times great portions of Northern Africa, which were capable of producing vast quantities of cereals in the Phœnician and Roman periods, have dried up. This is especially the case where Semitic invasions have swept over the country, entailing the destruction of forests. Where the original population (Berber) has largely survived, as in Morocco, the process of destruction has been arrested in part. In South Africa, even during the past century, there has been a distinct increase of arid country, such as in the Ngami region, which in Livingstone's time was well watered. The Zambezi itself has probably a less volume of water than when it was first discovered by the Portuguese. The level of certain rivers, such as the Shire, has fallen, and it is probable that the level of some of the great lakes, e.g. Nyasa, has been affected within historical times. The principal deserts are the Sahara, Libyan, and Nubian, in reality one great system, and in the south the Kalahari, the remains of a great inland sea, with a desert area of some 275,000 sq m.

FLORA In the north the Mediterranean flora predominates. In many respects the Atlas regions form part of the South European botanical zone. Plants which can

Village street in Moussembe, in the Congo country. All of the dwellings shown were the property of one man, indeed were his multiple home, for in each of the huts he kept a wife. Each fresh marriage entailed the building of a new dwelling as however many a man's wives were two were not kept in one house.

1. Bushman of South Africa, one of the most primitive people of the continent. 2. Warrior of the Zulus, the most powerful Kaffir group. 3. Masai warrior of Equatorial East Africa, of Negro-Hamitic stock. 4. Ethiopian, one of the later people of Asiatic origin to penetrate into Africa

AFRICA: TYPES OF FOUR OF THE PRINCIPAL NATIVE RACES

Africa. Characteristic products are gold and diamonds, respectively about 1-4 and 4-5 of the world's output; rubber, palm oil, ivory, ostrich feathers, dates and cotton

obtain moisture at a great depth, e.g. the vine, karoo bush, and alfalfa or esparto, flourish. The last is exported in great quantities from Algeria. The olive, laurel, citron, orange, almond, fig-tree, white poplar, lime, myrtle, aloe, oleander, cork, and varieties of the oak are characteristic; but there is also an intermingling of tropical and subtropical forms. In the southern oases the date-palm attains its greatest perfection, especially in the Taflet region, and tropical elements predominate south of the Atlas. Forest vegetation has largely disappeared from Algeria and Tunisia, but there still are extensive forests in Morocco, where the trees have a close affinity with the Iberian flora and include evergreen oaks, the sanobar, carob, cedar, and acacia. Farther south the mimosa flourishes. Cereals of all kinds can be grown. Beyond the northern botanical zone occurs the highly specialised flora of the Sahara, with mimosa, acacias, and tamarisks along the wadi (river beds) where moisture lingers, and tamarinds on the slopes of the Hoggar and other mountains. In the extreme south of Nubia the baobab begins to appear.

West Africa is the habitat of the various rubber-yielding lianas, ground-nuts, and other economic plants. The oil-palm (*Elaeis guineensis*) flourishes in the upper

coastal regions, and mahogany and ebony in the coastal forests, as well as the bamboo-palm (*Raphia vinifera*), the bombax or silk-cotton tree, and teak. Farther north the grass and scrub lands of the Sudan afford pasturage for flocks and herds, as they do in the drier regions of southern Africa. Tropical forests cover the coastal belts of tropical Africa and much of the basin of the Congo. The trees are evergreen and often form an impenetrable cover. The great Ituri forests, west of the Semliki river, cover an immense area in the Belgian Congo. Uganda, British East Africa, Cameroons, etc., also have great forests, where cedar (*Juniperus procera*) and the Ibean camphor (*Ocotea usambarensis*) grow to an enormous size.

Woods and Flowering Plants

South Africa is largely destitute of forest, although extensive areas of various yellow-woods and stink-wood occur. The tropical flora of the central regions gives place in the semi-desert districts to fleshy leafless mesembryanthemums, aloes, and other succulent plants, and to the curious tree-euphorbias. On the veld there is a great variety of beautiful flowering plants. In Portuguese East Africa and Angola the vegetation is extremely prolific. In Angola landolphas,

the mafureira (*Trichilia emetica*), and other economic trees and plants flourish. Sisal and many other fibres do extremely well in eastern Africa generally. In addition to the usual economic plants of Africa, such as cotton, tobacco, coffee (which flourishes in Abyssinia, British East Africa, and Nyasaland), bananas, and most other tropical plants known to commerce, there is an alpine vegetation on the higher peaks of East Africa, Abyssinia, and Cameroons, where some of the plants resemble those of the higher slopes of the Swiss Alps.

FAUNA. North of the Sahara the fauna is largely common with that of Europe and northern Asia. South of it is the African fauna proper. Here the open plains are the home of the antelope, giraffe, buffalo, zebra, wild ass, rhinoceros, and lion, leopard, and hyaena; although some of these also occur in the north of Africa. The African elephant wanders in both savannahs and forest regions. In the south it is still found in the Knysna and Addo districts of the Cape Province, where it is protected, but it is practically extinct south of the Zambezi. Bears, wolves, and foxes are confined to North Africa.

Introduction of Game Laws

The chimpanzee and gorilla occur in the forests of Western Equatorial Africa. Baboons are, with a few exceptions, peculiar to Africa, and the single-humped camel is found in the northern deserts and steppes. The okapi and giraffe are indigenous. The former exists in the Semliki forests, and the latter is most common in the southern Sudan, Somaliland, and British East Africa, although it is also found in the Kalahari Desert and in the north of the Transvaal and Matabeleland. The hippopotamus and crocodile abound in the tropical rivers. Until recently the former was found in the rivers of South Africa. Game laws have been enacted, and extensive game preserves prevent the extermination of the rarer species.

MINERALS. Apart from native manufacture, iron ore is chiefly worked in Algeria, where there is a large export from the Mokta-el-Hadid mines. Gold is found over extremely wide districts, ranging from the Gold Coast and Ashanti to the great gold deposits of the Witwatersrand, in the Transvaal, where extensive coalfields also occur. In addition there are many important deposits in other parts of Africa, notably in the Kilo and Moto areas in the N.E. of the

Belgian Congo and in the goldfields of Mashonaland and Manicaland. Diamonds are found chiefly around Kimberley, E. of Pretoria, in the Orange Free State, and in South-West Africa around Angra P. quena (Lüderitz Bay).

Copper and Coal Workings

Immense deposits of copper occur in the Katanga regions of the Belgian Congo, and it is also worked in Namaqualand near Port Nolloth, in the north of the South-West Africa Protectorate at the Otavi mines, in the north of the Transvaal at Messina, in the Victoria district of Rhodesia, and many other places. Coal is worked in Natal, in the Transvaal, at Wankie in Rhodesia, and at the Udi coalfields in Nigeria, and large deposits have been located in Katanga and elsewhere. Phosphates are exported extensively from Tunisia and Algeria. Abyssinia is highly mineralised.

COMMUNICATIONS. Until comparatively recent times communications in Africa have been mainly by means of caravans of porters from inland places to settlements on the coasts and vice versa, and by navigation along the great interior waterways. Caravans are still necessary in partially developed regions in order to bring produce to the nearest railway centre (e.g. Cameroons, Belgian Congo, etc.). Railways were first established in Egypt (1856), Algeria (1857) and Cape Colony (1859). There are three main gauges on the African railways—the Cape gauge (3 ft. 6 ins.) of the South African, Sudan, Nigerian, Ben-guella, and other railways; the metre gauge (3 ft. 3½ ins.) of the French colonial railways, the Uganda Railway, etc.; and the standard European gauge (4 ft 8½ ins.) of many of the Algerian and some of the Egyptian railways.

After the year 1880 very extensive developments took place in railway construction. The new era of communication was heralded by the commencement of the Kayes-Niger Railway in 1881, and the construction of the Lower Congo Railway (1890), joining the navigable sections of the lower and middle Congo river and providing an outlet for the immense territories of the Congo basin. There were in 1939 at least twenty main lines of railway communication: (1) Cape Town to Bukama, in the Belgian Congo, 2,598 miles, via Kimberley and Bulawayo; (2) Bulawayo to Beira, 676 miles; (3) Kimberley to Lourenço Marques, via Johannesburg, 703 miles; (4) Johannesburg to Durban, 482 miles; (5) Johannesburg to Port

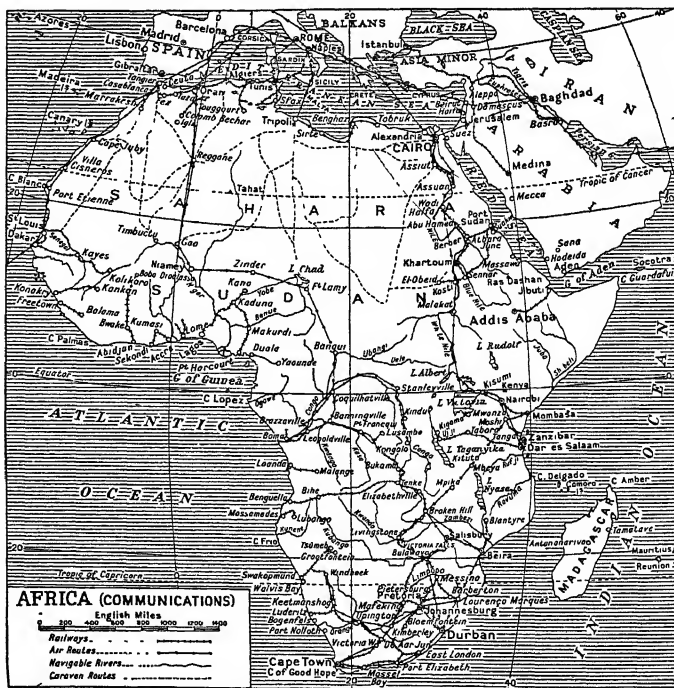

Elizabeth and East London, 712 and 665 miles respectively; (6) Dar-es-Salaam to Kigoma, on Lake Tanganyika, 780 miles; (7) Mombasa to Kisumu, on Lake Victoria, 584 miles; (8) Jibuti to Addis Ababa, in Abyssinia, 490 miles; (9) Port Sudan to Atbara Junction, 299 miles; (10) Wadi Halfa to El Obeid, via Khartoum and Sennar, 1,618 miles; (11) Alexandria to Shellal, via Cairo, 555 miles; (12) Tunis to the Moroccan frontier, 1,312 miles; (13) Philippeville to Touggourt, via Constantine, 337 miles; (14) Oran to Colomb Bechar, 465 miles; (15) Casablanca to Fez, via Rabat, 208 miles; (16) Dakar to Kayes, on the Senegal river, to run over 468 miles; (17) Kayes to Kolikoro, on the Niger, 343 miles; (18) Konakry to Kankan, 411 miles; (19) Lagos to Kano, 704 miles; (20) Walvis Bay to Cape Town, via De Aar, 1,635 miles.

Other railways have been constructed in Sierra Leone, Ivory Coast, Gold Coast, Togoland, Dahomé, Cameroons, Belgian Congo, Portuguese West Africa, Portuguese East Africa, Nyasaland, Tanganyika, and Uganda, while the important railway from Lobito Bay to Katanga provides a rail and water route across Africa from West to East, and also links with the Cape-Congo railway at

Tenke, 1,122 miles from Lobito Bay, 176 miles N. of Elizabethville, and 2,481 miles from Cape Town. This line is of great importance in the development of Katanga. A railway from Bene to Lake Nyasa crosses the Zambesi at Sena. Numerous other railways have been planned, the most important being (1) a Trans-Saharan railway from the coast of Algeria towards Konakry and Dakar in the one direction, and Lake Chad and the Congo regions in the other; (2) from Kafue to Salisbury in Rhodesia, shortening the route from Katanga to Beira by 587 miles; (3) from Porto Amelia to Lake Nyasa; (4) from Stanleyville to Lake Albert, giving direct communication between the Congo and the Nile. The so-called Cape to Cairo route, suggested by Cecil Rhodes, runs from south to north across Africa, but through railway connexion has not been completed.

Linking Waterways and Railways

An important problem of the future is the provision of adequate inter-communication between the navigable waterways and the railways. Many of the larger rivers of Africa are navigable for small steamers and launches over hundreds of miles (e.g. the Nile, Niger, Congo, Zambezi), but are broken into sections by rapids,

Africa The map shows the uniform plateau relief of the continent S of the Equator, the vast expanse of desert, and the almost unbroken coast line which impede traffic. There is steam navigation on the larger lakes, such as Victoria, Albert, Tanganyika, Nyasa and Mweru. Telegraphic communication from north to south is maintained via the Transcontinental line.

Africa is traversed by air routes from Cairo to South Africa and others in Western and Southern Africa. There is an important air route from Lisbon to Leopoldville, in the Belgian Congo, and thence to Cape Town.

LANGUAGES The languages of Africa may be grouped in the main under four heads: Bantu, Sudanic, Hamitic, and Semitic. The Bushmen and perhaps the pygmies have their own languages, of which little is known. Bantu and Sudanic are both negro language groups. Phonetically the former is distinguished by the simplicity and melodiousness of its vowels syntactically by its use of prefixes to indicate concords; the latter feature it shares with the semi-Bantu groups of Sudanic languages. Phonetically negro languages are usually distinguished by the importance of the tone (musical pitch) of a word.

The characteristics of Bantu and Sudanic languages can best be illustrated by a series of sentences translating our (1) good (2) woman (3) is working (4) Bantu *umfazi (3) wetu (1) omuhle (2) mya sebenza (4)* Timne *wunibon osu ofino o ; o mpant*

beings are the two Bantu classes which refer to human beings. The Bantu concord system is clear if the example above is compared with the plural form *abafazi betu abahle bayasebenza*.

Wolof belongs to a second order of language which has classes but no prefixes, and indicates the relations of words by the consonant prefixed to the *u* or other vowel of the particle, which is *d'* in the above instance in assonance with *d'igen*. The only change in the plural would be *yu* instead of *d'u*. Ibo has no concords and virtually no plural forms; the sentence can be made plural by inserting *obutu* (many) or *ja* (they). Hausa, which is perhaps an Hamitic language, has feminine forms, many plurals but no classes.

Some Sudanic languages are almost monosyllabic, like Boko, or if not monosyllabic, the words are made up of other words, each of which has its own meaning. At a stage beyond this—agglutinating—words are made up of roots and affixes; the latter cannot now be used alone, but may still be traced at times to originally independent words. Both in Bantu and Hamitic languages inflexions and internal changes are used to modify the meaning.

A third mode of classifying languages, applicable more especially to Sudanic tongues, is by their vocabulary. These languages may be grouped or classified according as they are, like Kru, now evolving classes, or, like Timne, have them fully developed, or, like Ibo, have had them and lost them. This gives us, geographically, fifteen or more groups, and formally, six or seven classes.

Ranging these geographical groups according to their syntax and vocabularies, we get (a) the West Sudanese including Kru,

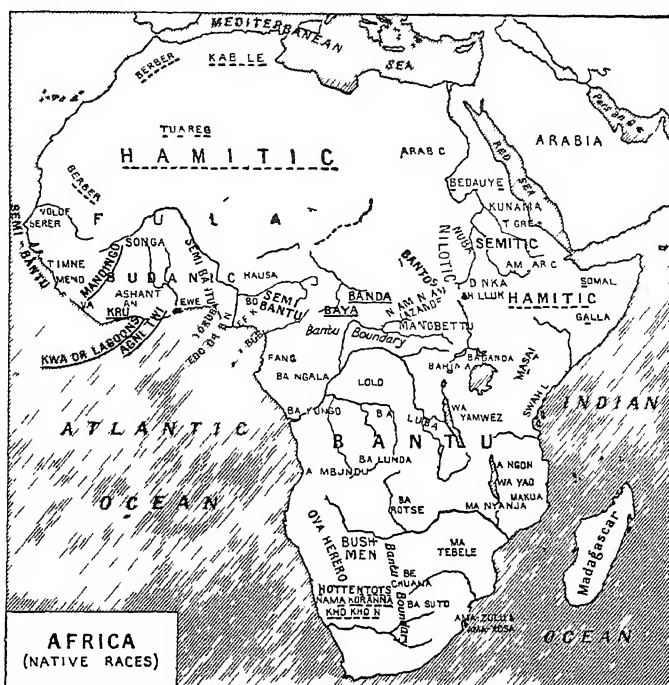

Africa Scene in a typical market place in British Central Africa, indicating something of the mixture of races that meet there

Mandingo Kwa, and Niger Chad, (b) semi Bantu, including the Atlantic coast tribes, peoples of the Volta river, Benue and Togoland, (c) Old semi Bantu, in Adamawa and on the Ubangi river, and (d) the middle Sudan group, which in the east includes Nilotic tribes closely allied in language to the Hamites. This system, however, disregards the history of the languages, and must be regarded as provisional.

The main characteristic of Hamitic languages is the use of gender in a sense nearly the same as in Indo European languages. In negro and Bantu it is common to distinguish human and non human, great and small, living and non living, but the Hamites commonly make sex the basis of distinction, though in Masai we find long grass is masculine, short grass feminine. It has been suggested that our notion of gender was originally based on the distinction of large (male) and small (female), and that Masai is a transitional language. Other features of the Hamitic languages are the use of suffixes, also found in negro languages, and inflexions proper, also in Bantu. They share with Bantu and some negro languages the use of many verbal forms, causative, inchoative, etc., distinguished by suffixes, and of tense distinctions dependent less on past, present, or future than on the completeness or incompleteness of the action. Owing to the influence of neighbouring tongues a language may pass from one group or one family to another, and in the transition stage its real position cannot be discovered.

The Bushmen of South Africa have their own languages, remarkable for the use of "clicks," sounds produced by the tongue, but their relations to other African languages are not determined. The pygmies of the equatorial zone speak Bantu or Sudanic languages.

The Fula language is spoken by

Eastern or Central Africa to the very extremity of the continent.

The Bushman and the Negro sub-species of man may have arisen in Asia, if not within the limits of the Mediterranean basin. From some focus in Southern Asia they migrated through Syria into Egypt and North Africa, and in another direction overspread India, Indo-China, Malaysia, and Oceania, even in a generalised form penetrating through Australia into Tasmania.

To some extent the negroid or negro type pervaded Southern Europe, and it certainly inhabited at one time the delta of the Nile. But with many fluctuations the Northern types of man could never leave Africa alone.

By about 20,000 to 10,000 years ago they had become the dominant race in North Africa, and had even penetrated to the Canary Islands. They must have pushed down either along the Atlantic coast of the Sahara Desert or across the Tibesti plateau-bridge into tropical Africa, and there have laid the foundations of the remarkable Fula cattle-keeping aristocracy. The Fulas invaded Egypt from the west, drove out, enslaved, or exterminated the dwarfish negro tribes, mingled in Ethiopia with those negroes and Bushmen whom they could not conquer, and produced an amalgam with contributions from Arabia, which we now know as the Hamitic race.

The white man from the north, again, colonised Asia Minor, Syria, Arabia, Persia, and Northern India. In Syria and Arabia, no doubt, he absorbed many pre-existing tribes of darker skin-colour and inferior physique. From Arabia, however, came across the Red Sea army after army of more or less Semitic people, seeking for a new home with a sufficiently abundant water supply. They first fused with the Hamites in the north of Abyssinia and the Red Sea coastlands, then took possession of the valley of the Nile, and by degrees extended their sway to its delta, and became what we know as the Ancient Egyptians, fusing to a great extent with the prior Libyan or Berber settlers from the west.

Foundation of Ancient Egypt

The civilized Egypt that was thus founded between 10,000 and 7,000 years ago had an immense effect on the subsequent history of Negro Africa. From Egypt there penetrated by degrees many of the inventions and the improvements of Neolithic Man. These included the domestic animals and cultivated plants of Asia

which could take root in tropical Africa, ideas on religion, ideas as to the use of metals, musical instruments, games, legends, the arts of weaving and dyeing, well-nigh all the elements of such civilization as was found among the negroes when the Arabs came in the full tide of Mahomedan propaganda, or as the Portuguese discovered them in the 15th and 16th centuries. No doubt, also, there were many influences spreading into Africa from prehistoric Greece and Italy, and certainly by way of Carthage and through the empire of Rome.

It would seem, indeed, as though 3,000 to 4,000 years ago there had been a distinct push southwards from the Mediterranean (distinct from Egyptian influence) which carried some great wave of North African influence into Central Africa. One of the earliest of such movements as these seems to have created a series of remarkable languages in Nigeria: first, the great languages of prefix, suffix, and concord, such as the Fula, the

Africa. Negroes of ancient Nubia
Painting in an Egyptian tomb

Bantu, and the semi-Bantu, and, at a later date, the sex-denoting languages of Hamitic aspect, such as Hausa and Musgu, or the Nilotic and Bongo languages of the Eastern Sudan and Equatorial East Africa. When the enterprise of Carthage declined and Egypt fell under the sway of Europe or Asia, a fresh enterprise arose, as to which in its earliest form we have only vague surmises and deductions. This was the direct influence of Arabia on East Africa, perhaps the outcome of Phœnician voyages.

The races of Africa range from the well-proportioned and comparatively fair Hamitic peoples of the Eastern Sudan, with regular European features, and the black populations of the Western Sudan and the White Nile valley, to the Bushmen and Hottentots, and dwarfish races of certain portions of the Congo regions. There is great variety of races even in the same district. Tall, dark peoples, such as those of the Ubangi, Aruwimi, Semliki, and Kasai basins, dwell in close contact with tribes who have a mean height of not more than 51 ins.; and in many parts differing races are inextricably mixed.

In the north occur the Hamitic Berbers, Egyptians, and Ethiopians, who are predominately Mahomedan, the Semitic Arabs and Abyssinians. The former are Mahomedans, while the latter profess a barbaric form of Christianity derived from Christian missionaries before the advent of Mahomedanism in North Africa.

The Negroids of Western Africa

The negroid peoples of Western Africa are divided into hundreds of groups, speaking distinct languages with little affinity to each other, and comprise the Fulas, who are more Hamitic in their characteristics than their immediate neighbours. Linguistically the negroids of Western Africa are roughly divided from the so-called Bantu peoples by a line running from Cameroons (Rio-del-Rey) to Lake Albert. North of this line are the Negroes proper and south of it races speaking one or other of the Bantu languages. With the exception of the Hereros of South-West Africa, they are mainly agriculturists. In addition, the Bushmen, who are nomad hunters, occur in scattered groups in the south-west portions of Africa, having been driven there from the far north of Tanganyika. They are a feeble and disunited people, and are closely allied to the Hottentots, a Negroid-Hamitic race who have retired before the Kaffir incursions into South Africa. The chief and most powerful Kaffir group are the Zulus of south-eastern Africa.

ANCIENT HISTORY. As stated above, the continent of Africa was not isolated from Europe or Asia in past ages, as it was imagined to be, before the Arabs, the Norman-French, the Catalans, and the Portuguese explored its interior beyond the Sahara Desert, or revealed the outline of its coasts to the astonished and greedy world of the Italian Renaissance. Northern Africa, N. of the Sahara Desert, was in almost all times of human existence more mixed up with Europe and Western Asia in its human history and migrations of the human species and varieties than tropical Africa across the Sahara Desert.

Although traces of ancient civilization have been found in the S. of Africa, e.g. the remarkable ruins at Zimbabwe in Rhodesia, the early history of Africa is mainly concerned with the various states in the N. part of the continent. The earliest recorded history is that of the Egyptians. Later the Phœnicians made settlements

along the littoral, founding the city of Carthage about 800 years B.C. The ancient Greeks, to whom Africa was known as Libya, founded the city of Cyrene c. 630 B.C., and in 332 B.C. Alexander the Great founded the city of Alexandria on the site of an Egyptian town. When Carthage fell in 146 B.C. the Romans erected the territory into an imperial province under the name of Africa, and to this day the Arabs call Tunisia

Reinforced by Mahomedan Persians from Shiraz on the coast of the Persian Gulf, they established some remarkable city states on the equatorial east coast between the mouth of the Juba river and Mombasa. Their predecessors, as early as the 6th century after Christ, had already penetrated East Africa in this direction and gained some knowledge of the existence of the mighty snow-crowned volcanoes of Kilima Niaro

that was now Christian, and to England and Ireland under the Plantagenets, but discovered, or rediscovered, the Azores and the Canary Islands, and found their way past the Atlantic coast of Morocco, probably right round Guinea, into the vast bight of West Africa. As early as the 14th century it seems as if Norman sailing-ships from Dieppe had reached the Gold Coast. Mahomedan adventurers and missionaries from Egypt and North Africa had in the meantime penetrated through the basin of the Niger from Lake Chad to Senegambia, and had not only discovered the gold of Bambarra, but had come to hear of the gold to be found in Ashanti, a region known vaguely as Wangara. In their intercourse with the Normans, Catalans, and Portuguese, they spoke of these gold-bearing regions in West Africa. But it seems to have been a desire for ivory and pepper as much as for gold which attracted to the Gold Coast the ships of Dieppe.

In the 15th century the Portuguese outdid all predecessors by their African discoveries. The royal family of Portugal had not only reconquered all Portugal from the Moors, but had now commenced to wage war on the Moors in Morocco, and in the early part of the 15th century conquered the promontory of Ceuta. They next seized other ports on the Atlantic coast of Morocco, and sent their vessels to reach the lands of flowing rivers and abundant forests south of the Sahara Desert.

Early Portuguese Explorers

By about 1484 the Portuguese, greatly assisted by Venetian and other Italian sea-captains and pilots, had discovered the whole coast of West and South-West Africa. By 1487 they had rounded the Cape of Good Hope, and at the very termination of the 15th century had passed round South-East and East Africa to Arabia and India. During the 16th century Portugal made acquaintance with Somaliland, Abyssinia, and the Red Sea, conquered more or less and explored Western Congoland, revealed to European knowledge the great Congo river so far as it was navigable from the sea, the Cameroons Mountains, South Africa and the land of the Hottentots and Bushmen, Zululand and the stalwart Bantu Kaffirs, Sofala and the gold mines, the Lower Zambezi, Mozambique, Madagascar, Zanzibar, and Mombasa. They discovered the Negro kingdom of Mosi north of the Gold Coast and had even, it is believed, penetrated to Timbuktu.

Africa. Typical Bantu house, Equatorial lakes region. It is made of Raphia palm stalks, the spaces between which are filled with leaves. The roof is of dried grass

Afrikiyah or Ifrikiyah. Later the Romans absorbed N. Africa into their empire and applied the name Africa to the whole of the continent as then known. (See Egypt, Ethiopia, Carthage, Cyrene, Alexandria, Nubia, Rome, Greece, etc.)

Before the Christian era opened, the sailing-ships of South-West and South Arabia seem to have passed cautiously from one port and island to another down the East African coast, until at last they discovered and colonised the north end of Madagascar and the Comoro Islands. Thence it appears likely that these pre-Islamic Arabs reached the mouth of the Zambezi and discovered the alluvial gold in South-East Africa.

MODERN HISTORY. After the first commotion created by the teaching and preaching of Mahomet, the Mahomedan Arabs recommenced their voyages to East Africa, this time more for the purpose of the slave trade and the procuring of ivory or the search for gold. By the 10th century they were already established in little sultanates at points like Kilwa on the east coast, and had seemingly reopened the communications with the gold-bearing regions of Southern Zambezia through Sofala, which was situated close to the modern Beira.

and Kenya. The Islamic Arabs, however, between the 8th and 18th centuries, directed their East African explorations rather in the direction of the Zambezi and Lake Nyasa. For some reason they fought shy of penetrating Eastern Equatorial Africa.

The renaissance of Europe after the Crusades began the tremendous movement, which reached its culmination in our own day, of the European exploration of the Dark Continent. The Crusades directed the attention of English, French, German, and Italian adventurers to the coasts of Morocco, Tunis, Tripoli, and Egypt, and as early even as the 11th century strange stories began to reach France, England, and Italy concerning the wonders of tropical Africa, stories picked up from contact with Arabs, Berbers, and Egyptians. When the ardours of the Crusades abated, there was a Europeanised Mediterranean which was regaining over the world of Islam something of the ascendancy that Rome won over Carthage.

In the 13th century there were bold Catalan and Genoese navigators with greatly improved and more seaworthy ships, who not only found their way through the Straits of Gibraltar to the Portugal

In the 17th century Italians—encouraged by the popes—English and French traders or sea-captains, and Dutch soldiers, merchants, and colonists had taken up the romance of African exploration. In the 18th century the British had as explorers distanced all other European nations. They put much of Lower Egypt on the map. They rediscovered, under Bruce, the sources of the Blue Nile, and set forth the geography of Abyssinia. They explored Senegambia and the Niger delta, and finally, through Mungo Park, discovered the Upper Niger. Acting for the Dutch Company in the south, they revealed the existence of the Orange river and some important features of South African geography.

As soon as the 19th century opened, British explorers again distanced all other competitors. Mungo Park followed the Niger from its upper waters to the falls of Busa; and a succession of other English explorers not only traversed the Sahara Desert from Tripoli and discovered Lake Chad, but also revealed the river Benue and the Middle Niger, and traced the Niger to its outlets into the sea. During the 19th century the British had revealed the whole course of the Congo, the sources of the Nile, and the great tributaries of the Bahr-el-Ghazal. They had finally surveyed Abyssinia and much of Somaliland, and discovered Lake Tanganyika, the Victoria and Albert Nyanzas, Lakes Bangweulu and Mweru, and the whole course of the Zambezi from its source to its mouth, as well as the course of the Limpopo river and all the other great and small streams of South Africa, the snowy range of Ruwenzori and the high mountains of North and South Nyasaland. In the discovery of South-Central Africa the missionary explorer David Livingstone (*q.v.*) played a great part.

Discoveries in the 19th Century

The Germans and the French likewise played a considerable part in the revelation of African geography during the 19th century. The Italians also took a hand, and the Portuguese interest in African geography was revived and filled up many of the smaller blank spaces on the maps of their possessions. The Americans, of the United States, founded the freed slave republic of Liberia, and they discovered the gorilla in the Gabun and the remarkable Fang people of that region. In the latter part of the 19th century they assisted to lay bare the geo-

graphy of the great British Protectorate of Uganda.

In the opening years of the 20th century the French completed the map of the Sahara, so far, at any rate, as all important geographical features are concerned. The Germans, who had cooperated with Stanley and Grenfell, with Belgians and with Frenchmen, in mapping the Congo basin, devoted themselves, with very remarkable results from a scientific point of view, to the survey of their large

for a time in West Africa. Taking advantage of the war with Holland in Charles II's reign, the English seized some of the Gold Coast possessions of Holland and retained them, though the Dutch remained a colonial power on the Gold Coast until the middle of the 19th century. The French also, in the 17th century, laid claim to Madagascar and occupied the Mascarene Islands abandoned by the Dutch. The British as a counterpoise took possession

Africa. Bantu maiden of the Equatorial lakes region, making a mat. The watching woman is wearing the skin of a cow as a token that she is married

colonies and protectorates in South-West Africa, in East Africa, and in Western Equatorial Africa.

The first European nation to take political possession of any part of Africa was naturally the Portuguese. Beginning with Morocco, Portugal, by the close of the 16th century, had erected many forts at different points along the coast of Africa. So far as the rest of Europe was concerned, she virtually claimed a monopoly of the African coasts from the Senegal right round to Cape Guardafui. But the Dutch seized Portuguese islands off the coast of Senegal, took possession of all the Portuguese forts on the Gold Coast, and all but conquered Angola, whence they were subsequently expelled by a return of Portuguese power. They founded under the Dutch East India Company the colony of the Cape of Good Hope, and made determined efforts—eventually defeated—to replace the Portuguese in Mozambique.

The French founded trading settlements in the 17th century at the mouth of the Senegal; the British established themselves at the mouth of the Gambia, and the Brandenburs

of St. Helena and Ascension. In the 18th century the French tried intermittently to replace the Portuguese in Abyssinia and on the Lower Congo, but their efforts were balked by British influence. The French similarly aspired to take over Cape Colony from the Dutch, and balked the British from similar ambitions. Their most amazing effort to found an African empire was the conquest of Egypt by Napoleon Bonaparte.

In the course of the Napoleonic wars the French were compelled to abandon Egypt, and although that country reverted to the Turks, the future British protectorate was more or less founded at the beginning of the 19th century. The British took possession, once and for all, of Dutch South Africa, and step by step extended the small Dutch colony of the Cape, until their flag waved at last over the whole of Trans-Zambezi Africa, save the Portuguese possessions on the east coast. The French, however, invaded and conquered Algeria. In the last half of the 19th century they added Tunis as a protectorate, and their small trading colony of Senegal grew into their gigantic empire over Western and North-

Western Africa, which now includes the greater part of Morocco, the whole of Algeria and Tunis, and extends to Lake Chad and Cameroons, to the middle Niger and to Dahomé, to the Ivory Coast and Guinea. At the end of the 19th century they had conquered Madagascar and had entered, explored, and annexed the Gabun and the N. Congo basin.

German explorers came to Africa at first more or less in the pay of the British government, or as missionaries affiliated to British missionary societies. They crossed the Sahara Desert and added greatly to our knowledge of Nigeria. They explored the Congo basin and South Africa. German missionaries discovered the snowy mountains of Kenya and Kilimanjaro, and played a considerable part in the opening up of the Nile valley. By the eighties of the 19th century the colonial movement for founding German possessions in Africa grew too strong for the German government to resist, and there were brought into existence between 1884 and 1890 a small protectorate over Western Dahomé (Togoland), a large protectorate between Lake Chad and Cameroons, and the huge colonies of South-West Africa and East Africa.

The Treaty of Versailles, 1919, deprived Germany of all her African possessions. Great Britain, France, and Belgium were appointed to act as mandatories of the League of Nations. Togoland was apportioned between Great Britain and France. About four-fifths of Cameroons were allotted to France, the remainder to Great Britain. S.W. Africa was placed under the administration of the Union of S. Africa, and German East Africa was divided between Great Britain and Belgium.

Italian Adventure

Both before and after German movements Italy's aspirations for an Italian Africa began. She commenced to take a definite interest in Tripoli when she was disappointed of Tunis, and in the opening years of the 20th century took the first excuse that Turkey gave her and conquered Tripolitania. When the British had established their virtual protectorate over Egypt, Italy secured from the crumbling Khedival empire the south-west coasts of the Red Sea and the frontier lands of Abyssinia and the eastern portion of Somaliland. To these were subsequently added the whole of Abyssinia (q.v.).

Portugal between 1884 and 1914 extended her possessions with the consent of other Powers, and thus became the mistress over about 900,000 sq. m. in West, East, and Central Africa.

Spain, owing to her unsettled government, has procured a very meagre portion. The Canary Islands she had had since the 15th century; in the following centuries she obtained from Portugal the port of Ceuta in Morocco, which has since been extended into the Spanish zone in Northern Morocco, the island of Fernando Po in the Bight of Biafra, and Corisco Bay to the north of the Gabun. But when the great partition of Africa began she managed to secure a protectorate over the Rio de Oro coastlands of the Western Sahara, which at any rate secured for her control over some of the most valuable fisheries in the world, and a desert region which is not without its importance in various directions. Simultaneously Corisco Bay was enlarged into the valuable little colony of "Spanish Guinea" or the Muni territory.

Holland and Belgium

After the Napoleonic wars Holland directed her colonising energies to the Malay Archipelago, and in order to make herself mistress of her Asiatic empire had to eliminate British claims. For this purpose she bargained away her forts and protectorates on the Gold Coast of West Africa and acquiesced in the Britannicising of South Africa. Dutch African commerce, however, found some consolation in the loss of the Dutch African colonies by flinging itself into the development of Congo trade.

Sir H. M. Stanley (q.v.) was the main agent in laying bare the geography of this wonderful region, but, at the time he did so, the British government had no desire to take advantage of his exploits, France was exceedingly jealous of this being done, and Germany intervened obscurely and put obstacles in the British path. Great Britain had to choose, in short, in 1884, between a Niger protectorate and a Congo claim, and she chose the Niger. But while the fate of the Congo was being secretly disputed between Britain, Portugal, France, and Germany, a rival, absolutely unanticipated hitherto, stepped in and secured the splendid prize. Leopold II of Belgium wished to make Belgium a colonial power and finally settled on Congoland

as his goal. The Congo Free State was annexed by Belgium in 1910.

Bibliography. Among the more important books on Africa for English readers are Tropical Africa, H. Drummond, 1889; The Development of Africa, A. S. White, 1892; History of the Colonisation of Africa by Alien Races, Sir H. H. Johnston, 1913; The Partition of Africa, Sir J. S. Keltie, 1895; Great Britain in Modern Africa, E. Sanderson, 1907; Map of Africa by Treaty, Hertslet, 1909; The Oxford Survey of the British Empire, vol. 3, Africa, 1914; The Dual Mandate, Lord Lugard, 1926; The Native Problem in Africa, A. L. Buell, 1928; Africa, a Geography, W. Fitzgerald, 1934. An African Survey, Lord Hailey, 1938; The Germans and Africa, E. Lewin, 1938; For discovery and exploration, see works by E. G. Ravenstein, T. E. Bowdich, James Bruce, Sir H. H. Johnston, Mungo Park, R. Caillié, D. Livingstone, Sir H. Stanley, Sir R. F. Burton, J. L. Krapf, J. H. Speke, Sir S. W. Baker, G. Schweinfurth, J. Thomson, W. Junker, M. Perham, and Robert Brown's Story of Africa and Its Explorers, 1892-5.

Africa General Service Medal. British decoration originally awarded in 1902 to commemorate military expeditions in East, Central, and West Africa. See Medals, colour plate.

African Lily (*Agapanthus umbellatus*). Fine bulbous plant

of the lily family, with long, fleshy, strap-shaped leaves, from the middle of which rises a leafless stem, two or three feet high. On the top is an umbel of many bright blue funnel-shaped flowers. It is a native of S. Africa, whence it was introduced to English conservatories in 1692.

African Lily,
Agapanthus

African Marigold (*Tagetes erecta*). Garden annual with a mis-

African Marigold,
Tagetes

leading name, for both this and its smaller congener, the French marigold (*Tagetes patula*), are natives of Mexico. They have much-divided leaves, the lance-shaped divisions having toothed edges. The composite flower-heads are borne singly on long stalks, which are thickened

considerably at the apex. This description applies to both species. While all the branches of the African marigold are erect, those of the French marigold are spreading. In colour, the flowers of the first are citron-yellow, of the second more tawny.

Africa Service Medal. South African award of the Second Great War. It was announced by Field-Marshal Smuts on Nov. 16, 1943, that King George VI had approved the institution of a South African medal to be awarded to all members of the Union Defence Forces or other uniformed services of the Union who "attested in service in Africa during the Second Great War before May 13, 1943," the day on which Africa was finally cleared of the Axis forces. The medal is of silver and represents the map of Africa. One side bears the inscription "Africa Service Medal," the other a leaping springbok. The ribbon is orange, with the green and gold springbok colours in vertical stripes on either side. Men and women were alike eligible for the award.

Africa Star. British award of the Second Great War, instituted Aug. 3, 1943, to commemorate the expulsion of the Axis forces from North Africa. This decoration was granted for service in North Africa between June 10, 1940 (when Italy entered the war), to May, 1943 (when operations against the Axis in North Africa ceased). The ribbon is pale buff in colour—symbolic of the desert—with a central vertical red stripe that stands for the armies, a narrower dark blue stripe for the naval forces and the merchant navies, and a light blue stripe for the air forces. It is worn with the dark blue stripe farthest from the shoulder. Awards of a clasp to the Africa Star for the

armies or in defence of Malta during the same period. In the Navy only those who served as part of the Eighth or First armies, on shore or in harbour, receive the clasp. The award to members of the Merchant Navy is restricted to those serving in vessels which worked inshore during the campaign. The star, of yellow copper zinc alloy, is identical in shape with the seven other campaign medals of the Second Great War. See Campaign Stars.

Afridi. Pathan tribe of the Indo-Afghan frontier. Tall, lean, light-tinted - Iranian Aryans, and avowedly Sunni Moslems, they speak a North Pushtu dialect. Of their eight clans the Adam Khel, of the Kohat Pass, and the Zakka Khel, of the Khyber Pass, have had to be the objects of British punitive expeditions.

Afridi of the Indo-Afghan frontier

Afrikaans. The home language of some sixty per cent of South Africa's European population. It is a direct, spontaneous, and unbroken development from the Dutch spoken in the province of Holland of the Netherlands three centuries ago. It differs from modern Dutch in that it has far fewer inflexions, less conjugation, no grammatical genders, and a simplified spelling, but especially in having its own home-grown idiom of the ox-wagon and the veld, as against that of the ship and the market-place. In the course of its growth Afrikaans has made a good many foreign words its own, but its vocabulary remains more than ninety per cent Dutch. Consider, for instance, the Dutch *Dat heb ik nooit kunnen denken* as against the Afrikaans *Dit het ek nooit kon dink nie*, for "I should never have thought that"; and *De geest is gewillig maar het vlees is swak* is, in Afrikaans, *Die gees is gewillig maar die vlees is swak*—"The spirit is willing but the flesh is weak."

The agreement between Afrikaans and Dutch is not always as close as it seems, because a particular Dutch word may have changed its meaning by being put to a new use in South African circumstances. So for instance

the Dutch *beest* may be an animal or insect, while the Afrikaans *bees* refers only to cattle. And the Dutch *meid* means very much what "maid" means in English, but in Afrikaans it is used exclusively of a coloured servant-girl. Put shortly, Afrikaans is not so much a simplified version of Dutch as a more analytic development from the same Old West Nether-Frankish dialect.

Afrikaans became a separate language about two centuries ago, but became generally known by that name only when Die Genootskap van Regte Afrikaners (The Society of True Afrikaners) was formed in 1875, and began publishing the monthly *Die Afrikaanse Patriot*. The champions of Afrikaans had to contend with opposition from Dutch as well as English from the very start, and its rights, whether constitutional or practical, have been political issues ever since. This accounts for the missionary zeal of Afrikaans writers and the comparative immensity of their output. After the South African War the cause of Afrikaans was taken up by J. H. H. de Waal, D. F. Malherbe, G. S. Preller (founder of the *Afrikaanse Taalgemeenskap* in 1906) and Eugene Marais, whose brilliant poem *Die Winternag* (The Winter Night) had appeared in 1905, and who was presently to gain an international reputation with his *Die Siel van die Mier* (The Soul of the Ant). Winternag was followed by an even greater piece of poetry in 1906—Jan Celliers' *Die Vlakte* (The Plain).

But the man who really taught the Afrikaner to read was C. J. Langenhoven, who thought at first that the cause of Afrikaans was lost, but later made magnificent amends by achieving for it an official status as the medium of instruction supplanting Dutch in the lower forms of the Cape Provincial schools. That was in 1914, and in the same year the Orange Free State and the Transvaal provincial councils followed suit. Largely because of his efforts Afrikaans became—instead of Dutch and equally with English—an official language of the Union in 1925. Since Langenhoven's death in 1932 both his further ambitions have been realized: the translation of the Bible was completed in 1933, and the Afrikaans Hymnary in 1944. Langenhoven's work was, and is being, carried on by D. F. Malherbe, Leipoldt, A. G. Visser, C. M. van den Heever, Joggem van

Africa Star. Ribbon and emblem for men of the British 8th army

army are restricted to service in the Eighth and First armies from Oct. 23, 1942, the date of the battle of Alamein, to May 12, 1943, inclusive. A silver emblem in the form of a figure 8 or 1, denoting the award, is worn on the ribbon on service dress. A clasp, denoted by the standard silver rose emblem, is awarded to R.A.F. personnel who operated in support of the Eighth and First

Bruggen, "Sangiro," the Hobson brothers, P. de V. Pienaar, Hettie Smit, and A. H. Jonker, and the poets W. E. G. Louw, N. P. van Wyk Louw, I. D. du Plessis, Uys Krige, Elisabeth Eybers, and a good many others.

Consult Professor J. J. Smith's authoritative article on the origin of Afrikaans in the Official Union Year Book for 1925; The Achievement of Afrikaans, by T. J. Haarhoff; and, in Afrikaans, E. C. Pienaar's *Die Triomf van Afrikaans*.

Jan Tromp

Afrika Korps. German army corps of the Second Great War. Erwin Rommel, after playing an important rôle on Hitler's staff in the Polish campaign of 1939 and commanding a division in France in 1940, was entrusted with one of Hitler's most ambitious military experiments—the formation of a body of soldiers to serve in North Africa. The men, specially selected by Rommel for this purpose, underwent an extremely arduous training at a camp near Hamburg, where they were subjected to the rigours of desert warfare in artificially created conditions approximating as closely as possible to those existing in Libya and Egypt.

In March, 1941, almost simultaneously with the German attack on Greece, Rommel struck at Wavell's imperial army in Western Cyrenaica, reinforcing the shattered Italian forces with the highly mechanised divisions of the Afrika Korps at El Agheila, 130 m. S.W. of Benghazi. Developing an extremely powerful weight of armour, the Afrika Korps used the ports of Tunis and Tripoli as landing-bases for its Libyan campaigns, and the speed with which supplies were landed doubtless contributed to the success of Rommel's men as they struck against the British, driving Wavell's troops back across Libya to the Egyptian border. After the fluctuating desert campaigns of 1941-42, the Afrika Korps was eventually held, and then routed, by the British 8th Army at El Alamein. In the British offensive that opened on Oct. 23, 1942, Rommel's defensive lines were smashed. Within 15 days he lost half his great tank force, and the remnants of the once powerful Afrika Korps fled across Libya towards Tripolitania and Tunisia, defeated and broken. See Alamein; North Africa Campaigns.

Afrikaner Bond. Association of Afrikaners, i.e. Dutchmen born in S. Africa, formed in British South Africa in 1880. Its object was to secure the independence of the country, "a united South Africa under its own flag." It held its first congress in 1882, and its leader was J. H. Hofmeyr. In time it became less hostile to British rule, but it was supported by the more aggressive section of the Dutch population, and during the war of 1899-1902 it sympathised with the Boers. After the war the Bond was re-organized, and its members, aiming at an extension of Dutch influence, but favouring federation under the British crown, shared in the Union negotiations of 1910. See South Africa: History.

Afterbirth. Term which includes the placenta, or mass of tissue uniting the infant with its mother, while in the womb, by means of the umbilical cord, and the membranes which surround the infant during development. Normally the afterbirth should be expelled shortly after the birth of the infant. See Obstetrics.

Afterdamp. Also sometimes called choke damp. Following an explosion in a coal mine, the air is deficient in oxygen, with high proportions of carbon dioxide and carbon monoxide, and is consequently both asphyxiating and highly poisonous. It is the cause of many fatal casualties. Rescuers in the affected pit have to wear oxygen masks. Choke damp is more correctly described as fire-damp and is given off from a coal seam. It consists largely of methane, and when mixed with air is highly explosive. It is not poisonous but affects mine personnel because of the reduction in the oxygen of the air. By the Coal Mines Act of 1911 underground workings are required to be adequately ventilated to prevent the accumulation of afterdamp and fire-damp. Fatal casualties due to the explosion of fire-damp and coal dust in 1944 were 19; there were also 8 deaths from asphyxiation due to natural gases produced in the workings. See Fire-damp; Mining.

Afterglow. A faint glow occasionally seen in the western sky during very clear weather. Soon after sunset an observer and the air for several thousands of feet above him are in the shadow of the earth which is cast by the sun as it sinks below the horizon. Therefore at this time a glow can only be seen in the upper air,

where it is produced by very fine particles and increases in intensity as the lower air becomes darker. This rosy-coloured glow disappears when the sun reaches about 68° below the horizon, but is followed in the clearest of weather by an afterglow whose shades are a delicate rose or purple colour. This afterglow is probably a second glow ring of the same origin as the earlier glow, but at a greater angular distance from the sun. Afterglows are usually best seen in winter, when the lower atmosphere is less troubled by haze. For a long time after the eruption of Krakatoa in 1883 very striking afterglows were witnessed in almost every part of the world. See Bishop's Ring.

Afyon Karahisar. Town of Turkey, capital of the vilayet of the same name. Standing at the junction of the Izmir and Anatolian rlys. 180 m. E. of Izmir, it is the centre of an opium-growing district, the name meaning "opium black castle." It has manufactures of saddlery and carpets, and there are several mosques. Its ancient name was Synnada. Pop. of vil., 299,248.

Agades. Town of French West Africa. Capital of the Saharan oasis of Air or Asben, it is on the caravan route between the Sudan and Tripoli.

Agadir. Bay and port of Morocco, 23 m. S.E. of Cape Ghir. In 1910, as a counterpoise to the influence of France in Morocco, some German capitalists bought from the sultan concessions over a large part of the country. In July, 1911, the German government sent the gunboat Panther to Agadir, and her officers promised the Moroccan kais the support of Germany in resisting the control of France. This nearly brought about a European war, but the two Powers came to an arrangement by which France was given a free hand in Morocco in return for the cession of about 100,000 sq. m. of land in the Congo basin. See Morocco.

Agag. Amalekite ruler spared by Saul against the divine command and cut to pieces by Samuel at Gilgal (1 Sam. 15).

Agaiambo. Tribe of mixed Papuan and Melanesian stock in Papua, probably now extinct. Driven by virile neighbours into the marshland behind Ketakerua Bay, they erected pile-dwellings for themselves and for the pigs which, with waterfowl and fish, formed their animal food. The

legend of web-footed Papuans arose from this tribe, whose canoe life and marsh-wading habits softened and splayed their feet.

Agā Khan. Title of Hasan Ali Shah (1800–81), hereditary chief and unrevealed imam of the Ismailite sect of the Mahomedans. Born in Persia, he claimed direct descent from caliph Ali and from Persian royalty. He was governor-general of the province of Kerman but fell out of favour and fled to India.

Agā Khan III. Sir Mahomed Shah, was born in 1877, knighted in 1902, and for important services

Agā Khan III,
Indian prince

in the First Great War was granted the status of a first-class Indian prince. He represented India at the World Disarmament Conference at Geneva, 1932, and led the Indian delegation to the League of Nations Assembly, 1932 and 1934–7, being elected president of the assembly in 1937. Hereditary head of the Ismaili Mahomedans, he founded the Moslem university of Aligarh (*q.v.*) in 1910. A well-known sportsman, he won the Derby four times. In 1935 his horse Bahram won the 2,000 Guineas, the Derby, and the St. Leger. The Agā Khan's palace at Poona was the scene of conferences in 1927 and 1931 presided over by Lord Irwin, then viceroy of India, and attended by Gandhi. In 1943–44, the latter was imprisoned there.

Agamemnon. In Greek legend, king of Mycenae in Argos, and leader of the Greeks in the Trojan War. He was the brother of Menelaus, the husband of Helen, whose abduction by Paris was the cause of the war. The Greek fleet was assembled at Aulis but detained there by a calm sent by the goddess Artemis, whom Agamemnon had offended by killing a stag sacred to her. To appease the goddess, Agamemnon agreed to sacrifice his daughter Iphigeneia; at the moment of sacrifice, however, she was carried off in a cloud by Artemis.

In the tenth year of the war occurred the famous quarrel between Agamemnon and Achilles over the possession of the captive maiden Briseis. At the end of the war, when Agamemnon returned to Mycenae, he was murdered, together with the Trojan princess

Cassandra, by his wife Clytaemnestra and her paramour Aegisthus. They were afterwards put to death by Agamemnon's son Orestes. The story is the subject of the trilogy—Agamemnon, Choephoroi, and Eumenides—of Aeschylus and of tragedies by Sophocles and Euripides.

Agamemnon. A tragedy by Aeschylus, first play of the trilogy Oresteia, acted 458 B.C. After the conquest of Troy, Agamemnon on his return to Mycenae is received with treacherous words of welcome by his wife Clytaemnestra, enticed into the interior of the palace, and murdered by her in his bath. The murder takes place behind the scenes, being indicated to the audience by the shrieks of the dying man.

Agamogenesis (Gr. *a*, not; *gamos*, marriage; *genesis*, origin). In biology, a method of reproduction found among some lower animals and in certain plants, in which the reproductive cell develops without fusion with any other cell. It is asexual reproduction. In the hydra, a fresh-water creature, this mode of reproduction is found to occur in spring and summer, when it produces these asexual buds. Having attained a certain size, they leave the parent body. See *Biology*; *Life*.

Agā Mohammed (c. 1740–97). Shah of Persia and founder of the Kajar dynasty. The son of the Kajar chief Mohammed Hasan, he was castrated in boyhood by Adil Shah, and became known as the Eunuch. After his father's death he surrendered to the Zend chief Karim Khan, by whom he was kept in honourable captivity at Shiraz. At Karim's death in 1779 he escaped from Shiraz and began his struggle for the crown. In 1795 he took Kerman, massacred the inhabitants, murdered the reigning sovereign, Lutf Ali Khan, and almost exterminated his family. He was crowned shah in 1796 at Teheran, which he made his capital, and in 1797 was assassinated by two of his slaves.

Agao. Collective name for various groups forming part of the primitive Hamitic stock in Abyssinia. They are mentioned in a second century inscription. Driven S. and W. by Semitic immigrants from Arabia, they are found chiefly in the Lasta and Agaomidir provs. Broad-faced, yellow, straight-haired, their racial characters and dialects include those of the Bogos and Falashas.

Agapanthus. Botanical name for the African lily (*q.v.*).

Agape (Gr. *agapē*, love). Love feast peculiar to the early Christian Church. It preceded or followed the Eucharist, and later became a charitable gathering and a social banquet. Abuses soon arose (1 Cor. 11, and Jude), and the agape was separated from the Eucharist. It was condemned by the councils of the Church, and between the 4th and 7th centuries almost disappeared. It survives in the distribution of blessed bread after the Eucharist in Eastern and French churches, and in certain gatherings held by the Moravian brotherhood. *Pron.* ā'-gāpē.

Agapemone (Gr. *agapē*, love; *monē*, abode). Headquarters of a community of both sexes, founded in Somersetshire in 1859 by Henry James Prince, formerly a doctor of medicine and a Church of England clergyman (1811–99). Prince styled himself "the beloved" and a reincarnation of the Holy Ghost. He and his followers lived in the "abode of love," a luxuriously furnished building at Spaxton, professedly with all things in common, but yielding implicit obedience to the head. Prince was succeeded by T. H. Smyth-Pigott, also a clergyman, in 1902. He was pastor of an affiliated church at Clapton, London. After many scandals, culminating in 1908, the movement died away. A similar community, the Familists, founded in East Friesland in 1540, spread to England, and in spite of a royal proclamation against it in 1580, existed until the 17th century. *Pron.* ā-gāpēm'-onē.

Agapetae (Gr. *agapetos*, beloved). Female celibates and widows who in the 3rd century devoted their lives to the service of the clergy. After being subject to repeated regulations and denounced by Cyprian, Jerome, and others, they were suppressed by the Lateran Council of 1139.

Agar. Town in Gwalior, Central India. It is 100 m. N.W. of Bhopal and 1,598 ft. above sea level. Pop. 3,586.

Agar-agar. Gelatinous substance obtained from certain red seaweeds (Rhodophyceae), obtained from Ceylon (Ceylon moss), Java, Japan (Japan isinglass), and, during the Second Great War, Great Britain. The gel (colloid jelly) from agar-agar is not liable to putrefaction and is therefore used largely as a medium for bacteriological cultures. Agar is also used in preserves, jellies, and soups, as a dressing or stiffening for light fabrics, and in constipation remedies. See *Algae*.

Agaric. *Agaricus campestris*, or the common edible mushroom

Agaric (Gr. *agarikon*, fungus). General term in botany used to denote numerous species of fungi, including the mushroom.

Agaric. Poisonous kind, the fly agaric

in the Carpathian Mts, it is on the Trotus river, 35 m. W.S.W. of Bacau. Rumanian territory was entered by the Austro-German forces at this point on Oct. 18, 1916.

Agassiz, Mount. Peak of the Andes, 10,400 ft. above sea level, named after Louis Agassiz. In Argentina, on the Chile border, it gives its name to a co. in Chile.

Agassiz, ALEXANDER (1835-1910). Swiss-American scientist. Only son of Jean Louis Agassiz, he was born at Neuchâtel, Switzerland, where his father was professor, and went with him to America in 1849. Graduating at Harvard, 1855, he became its curator at the Museum of Comparative Zoology, 1874-97. In the interval, as superintendent of copper mining south of Lake Superior, his knowledge of geology, chemistry, and engineering enabled him to develop the mines and to amass a fortune, which he devoted to zoological research. Specialising in marine zoology, he established a marine station on Rhode Island in 1875. His principal writings deal with coral formations.

Alex. Agassiz, Swiss-American scientist

Agassiz, JEAN LOUIS RODOLPHE (1807-73). Swiss-American naturalist. Born at Motier, Switzerland, May 28, 1807, he studied medicine at Zürich, Munich, and Heidelberg, was professor of natural history at Neuchâtel, 1832-46, and an ardent

follower of Cuvier. His work in 5 volumes, *Recherches sur les poissons fossiles*, was published 1833-43, and his scientific investigation of the movements of glaciers resulted in *Etudes sur les glaciers*, 1840. After lecturing at Boston, U.S.A., in 1846, he was appointed in 1848 professor of natural history at Harvard, where later he established the museum of comparative zoology. He left his great work on the Natural History of the U.S.A. unfinished. He died at Cambridge, Mass., Dec. 14, 1873. He gave his name to the Agassiz Association, an American society, formed in 1875.

Agate. Variety of chalcedony (silica) deposited from water, usually presenting a banded or ribbon-like structure due to pauses in its growth. Its hardness makes it suitable for mortars, pivots, bearings in electrical instruments and knife edges in chemical balances. The more delicately banded and coloured varieties are used as ornamental stones. The name is said by Pliny to be derived from Achates, a river in Sicily, where it was originally found.

Agates may be classed as semi-precious stones. When the bands are fairly regular the stones are known as ribbon-agates. Onyx is a ribbon-agate with cloudy white bands alternating sharply with black bands. In cornelians white alternate with red, and in sardonyx with brown. Moss agate, or mocha-stone, has beautiful moss-like patches of a fibrous mineral. The choicest varieties are found in India, Uruguay, Southern Brazil, and Bohemia. Scotch pebbles are pretty agates found chiefly in Angus and Perthshire.

Agate, JAMES EVERSHED (1877-1947). British author and critic. Born at Manchester, Sept. 9, 1877, he was educated at Giggleswick and Manchester grammar school. He was appointed dramatic critic of the Sunday Times in 1923. His many publications include a sequence of autobiographical volumes with the general title of *Ego* (1935 onwards): these form a valuable record of events and personalities in literary, theatrical, and social life. Died June 6, 1947.

Agatha (d. 251). Saint, virgin and martyr. Sicilian by birth, she suffered martyrdom under Decius at Catania, after having been tor-

tured by the praetor Quintianus, whose addresses she had rejected. Canonised by Pope Gregory I, a chapel in Catania cathedral is dedicated to her, and her festival is kept on Feb. 5. Her name is in the Church of England calendar.

Agathocles (361-289 B.C.). Tyrant of Syracuse. Of humble birth, he entered the army as a common soldier, but having married the widow of his wealthy patron Damas, became the richest man in Syracuse. Expelled from the city by his enemies, he returned with a band of mercenaries and was besieged in Syracuse 310 B.C., but triumphantly carried the war into the enemy's country in N. Africa. Henceforth (307 B.C.) he was king of all Sicily. His success-

Agathocles, Tyrant of Syracuse
Bust in National Museum, Naples

ful campaigns against the Bruttii in Italy and the people of the Lipari islands consolidated his rule.

Agathon (d. c. 400 B.C.). Athenian dramatist. He was a pupil of Gorgias and a friend of Plato and Euripides. Only fragments of his tragedies have survived, but the Alexandrian critics assigned him a high place. He wrote *The Flower*, the first Greek play with an original plot, the subject of previous dramas having been taken from mythology. Agathon was also the first to make his choral odes mere lyrics having no connexion with the theme of the play.

AGAVE OR AMERICAN ALOE.

Plant so called from a superficial likeness to the true aloe, to which it is not related, the agave being an amaryllid, while the aloe is a lily. There are many species of agave, all natives of S. America,

Agave,
or American Aloe

Mexico, and the southern United States; but the best known is the noble *Agave americana*, which is fabled to flower once in a hundred years. The stem is very short and supports a rosette consisting of from 30 to 50 leaves from 4 ft. to 6 ft. in length and more than $\frac{1}{2}$ ft. broad. They are very thick and fleshy, the upper surface is concave, and the edges are armed at short intervals with hard spines. A single leaf weighs about 12 lb., and lives about six years.

The plant matures slowly in 10, 20, 50, or even 70 years, and then very rapidly develops a flowering stem from 15 ft. to 40 ft., its upper portion with horizontal branches, which bear several thousands of yellow-green flowers. The flowering exhausts the plant, and it soon dies. The roots and leaves contain valuable fibres (pita thread) of a tough character, from which twine, cordage, and paper are made. The sap from the undeveloped flowering stem when fermented becomes pulque, the national drink of the Mexicans, and mescal, a kind of brandy of highly intoxicating quality.

Agde. Seaport and town of France, in Hérault department. On the Canal du Midi, 2 m. from the sea and 30 m. by rly. S.W. of Montpellier, it was known to the ancient Greeks as Agatha. Its fortified cathedral church of S. Étienne is medieval. It has an active coast and fishing trade.

Age (Lat. *aetas*, age, O. Fr. *age*). Physiologists divide the life of human beings into five ages: infancy to 7 years, childhood to 14, youth to 21, adult to 50, and old age thereafter. Some physiologists recognize, with Shakespeare, seven ages: infancy, childhood, boyhood or girlhood, adolescence, manhood or womanhood, age, and old age. In law a person is an infant up to 21 years, when he or she reaches majority. A child (boy or girl) cannot be legally guilty of crime before the age of 8 and only then on proof that he knew what he was doing; at 14 he can be guilty of crime without special proof. A child can be sent to prison at 17 and, in exceptional cases, at 14. At 16 he or she can marry (the consent is also required of parents or guardians up to the age of 21). Children cannot be employed if more than two years below the school leaving age. Eighteen is the earliest age at which a child can legally be sentenced to death. The sovereign becomes of full age at 18. At majority full legal rights

and obligations are applicable. In Scotland there is no legal infancy; a male is in a state of pupillage up to 14 years, a female to 12, both then becoming minors until 21. A person may marry without parental consent under 21.

In the British Empire, majority is usually reached at 21 and also in most of Europe. In France and Belgium marriage without consent of guardians was prohibited before 25. Majority ages in other countries are: China, 20; Brazil, Mexico, and Peru, 21; Argentina, 22; Chile, 24. In the United States the majority age is 21, but in seventeen States it is 18 for females. A male can vote in the U.S.A. at 21, be elected to Congress at 25, and to the Senate at 30.

The average age of Europeans has tended to increase in the twentieth century. In England and Wales the percentage of persons in the later age groups increased as follows:

Age Group	1921 Census	1931 Census	1940 Estd.*
	%	%	%
25-49	35.66	36.12	37.48
50-74	17.34	20.64	26.29
75-85 onwards	1.71	2.05	2.7
	54.71	58.81	66.47

* Civilians only

See Infant; Longevity.

For animals, reliable records of age are only obtainable under captivity or more or less unnatural conditions, and figures are accordingly vague. For instance, the African elephant has been credited with reaching 150 to 200 years. Hunters estimate that in the wild state 100 years is probable. The Indian elephant reaches 70-80 years. Other Zoological Society figures for mammals are: porcupine, 10-14 years; wolf, 12-15; reindeer, 12; antelope, leopard, sea lion, 15-20; tiger, 20; lion, Bactrian camel, 20-25; giraffe, 25; brown and Arctic bear, 30; rhesus monkey, 30-35; rhinoceros 35-40; orang-utan, chimpanzee, 40-45; gorilla, 45-50; hippopotamus, 45. For whales no reliable figures can be given, published estimates of 300 to 500 years being unsound. For domestic animals average ages are stated as: cat, 12-15 (may be greater); dog, 12-15 (authenticated cases of 25 years); horse, 25 (have reached over 30 years, equivalent to a man of 80). The common statement that a dog's age multiplied by 7 gives the human

equivalent is only partly correct, a dog reaching puberty at a much earlier relative stage, but at 5 years it may be said to be equivalent to a man at 35.

Among birds, parrots have been recorded as exceeding 100 years. Other statements are: raven, over 50; blackbird, 18; pigeon, 20; sparrow, 40; eagle, 60 and over: swan, over 100. Among fish, pike and carp are reputed centenarians. Insects have been studied, the common moth living for about $3\frac{1}{2}$ days, the mayfly for 1 day, and the dragonfly for 7 weeks. According to Weisman, protozoa, which multiply by division, are to be considered as immortal. See C. S. Minot, Problem of Age Growth, and Death, 1908.

Age. Term applied to any prolonged period of time which is regarded as having some special characteristic distinguishing it from other prolonged periods. An equivalent term is era. Occasionally, but incorrectly, epoch is used in the same sense, though it should be used only for the starting-point.

There is no limit to the length of the period which may be spoken of as an age. Geologists name ages in accordance with the formation of the earth during periods which may have extended over hundreds of thousands of years. The age of the palaeontologist or anthropologist is named according to the progress of mankind in the use of implements—the Palaeolithic and Neolithic, the earlier and later stone-periods when he employed flints, not having discovered the use of metals: the bronze age, and the iron age. Quite mythical ages, too, were imagined by the ancients, a golden age when the world was innocent and happy, a silver age of degeneration, a brazen age of violence, and the last and most unholy age of iron. But the world had entered upon the iron age before this conception had taken shape, and has remained in it.

Historians have not established such well-marked divisions under the name of ages, though the name of the Middle Ages is given to the interval between ancient and modern times, roughly speaking, from the 5th to the 15th century. The earlier and longer period of the Middle Ages is also occasionally called the Dark Ages from one point of view, and the Ages of Faith from another. The name age is given to specific sections of time, most commonly taking their title from some prominent personality, such as the Age of

Elizabeth, the Age of Louis XIV and the Augustan Age.

Ageing. Process, natural or artificial, whereby the properties or characteristics of materials are changed after a longer or shorter period of time. In rubber by perishing, in metals by fatigue, or in wood by decay, it is detrimental. In other materials it may be beneficial and be produced artificially. In alloys such as those of aluminium there is a period of age-hardening which can be hastened by heat or other treatment. Chemical changes due to the passage of time can be speeded up, as in the increased absorption of oxygen in varnishes, oils, rum, etc., by standing in open vats. Whisky is aged, or matured, by oxygen under pressure. In calico dyeing and printing, ageing machines are employed. The weathering of clay for brick and pottery making is a form of ageing. Iron used in electro-magnets in electrical machinery and transformers suffers an ageing loss which is considerably reduced by the use of special silicon alloys of iron, such as stalloy. Concrete hardens after a certain time and this is referred to as ageing or curing. See Alloy: Concrete.

Agen. City of France. Capital of the department of Lot-et-Garonne, it is on the Garonne. 84 m. by rly. S.E. of Bordeaux. The ancient Aginnum, it is a bishop's see, has a 12th century cathedral, and many old buildings and institutions. It is noted for its prunes, poultry, and other table delicacies, manufactures woollen and linen fabrics, and is an important rly. centre. It was the birth-place of the scholar Joseph Scaliger, and there is a statue of the native poet Jasmin. Pop. 24,939.

Agency (Lat. *agere*, to act). Term describing the legal relationship between a person, called the agent, who acts for another, called the principal. Agency is a matter of authority, and this authority may be implied or expressly conferred. The term agency was formerly also used to designate a group of native states in India the administration of which centred upon a British official agent.

Agent. In law, one who acts for and on behalf of another (the principal) in such a way as to make the principal legally liable for his acts and defaults.

As between principal and agent, the rights and liabilities depend on the agreement between them; but when an agent acts for his principal, the latter is bound by his

acts if they are within "the scope of his authority." By this phrase is meant that an agent of a particular class is supposed to have authority to do those acts which such an agent usually has. Thus, if a commercial traveller accepts an order for goods at £2 a ton, or on the terms of three months' credit, his principal is bound by these terms, although the traveller may have been told not to accept orders at less than £3 a ton, and to give no credit. Partners are agents for the other partners in all ordinary matters relating to the business in which they are jointly engaged.

By the doctrine of ratification, if a person purports, without authority, to act for a principal, the principal may, on learning what has been done, ratify the agency, and take the benefit and assume the burden of what has been done in his name. If, however, he refuses to recognize it, the agent is personally liable, on what is called a "warranty of authority." A wife, living with her husband, is his agent to pledge his credit for household necessities, including clothing for herself and the children suitable to her husband's station in life. The authority of an agent is revoked by the death or bankruptcy of the principal. It may also be expressly revoked at any time by the principal. And if an agent is engaged, say, for three years, and the principal revokes his authority at the end of one year, the revocation is good, though the agent may still have the right to bring an action for wrongful dismissal.

An agent is entitled, in the absence of express agreement, to the customary remuneration for his services, or, if there is no customary sum, to a reasonable amount. He must not accept remuneration from anybody but his principal, and may not make any other profit. If he does, he forfeits the right to remuneration. He is entitled to be reimbursed and indemnified for all acts done and expenditure incurred within the scope of the agency. He is liable for negligence in the conduct of his principal's business, and is bound to display all the skill and diligence necessary and usual in such agencies. Thus a solicitor must take the proper steps in an action at law; an accountant must be accurate in an audit; a stock-broker must know the prices on the Exchange. Agents on particular markets (e.g. brokers on the London Stock Exchange) can bind their principals according to the customs of those markets.

A servant is the agent of his master within "the scope of his employment," and the master will even be liable for his frauds. Thus, where a bank manager gave false information to a customer in answer to one of the usual inquiries, whereby the customer lost money, the bank had to pay, because it was part of the manager's business to answer such inquiries. The maxim, *Qui facit per alium facit per se*, i.e. who acts through another, acts himself, is always applied.

Agent-General. Name given to the London representatives of certain of the component states of the British Dominions. They act as business representatives of their governments, and have offices for the transaction of their duties. The representatives of India, Pakistan, Ceylon, Canada, Australia, S. Africa, New Zealand, S. Rhodesia, and Eire bear the title of high commissioner.

Agesilaus (c. 442-360 B.C.). King of Sparta. Though lame and of insignificant appearance, he was one of the ablest generals of his time. An appeal from the Greeks of Asia Minor for help against the Persians led him to declare war against Persia. After a victory on the Pactolus in 396 he was preparing an expedition into the interior of the Persian empire, but was obliged to return to defend Sparta against a coalition of Athens, Thebes, Argos, and Corinth. The coalition was beaten (394) at Coronea in Boeotia.

Thebes, however, gradually increased in power, and in 371 Sparta was defeated at the battle of Leuctra, and might have suffered extinction but for the efforts of Agesilaus. This danger lasted until the death of the Theban leader Epaminondas, at the battle of Mantinea, in 362. In 361 Agesilaus led an expedition into Egypt to assist King Tachos against the Persians, but died in the following year.

Aggershus or **ÅKERSHUS**. Amt or county of S.E. Norway, between Sweden and Oslo Fiord. It has several lakes, and an area of 2,064 sq. m. Oslo is the capital. Pop. 236,939. The fortress of Aggershus stands at the head of Oslo Fiord, on a headland dividing the harbour of Oslo into two parts. Erected in the 13th century, it was a royal residence down to the 18th century, then became a prison and arsenal.

Agglomerate (Lat. *agglomerare*, to form into a mass). In geology, name of deposits formed

of blocks of igneous and other rocks filling the neck of a volcano or other volcanic orifice. The blocks are usually of varying size and character. Such deposits may be studied in the shore-sections of Fife.

Agglutination (Lat. *agglutinare*, to glue). Term used in philology and bacteriology. Words or roots combined into compound terms are said to be agglutinated. Turkish, Mongolian, Japanese, and other languages are types of what are called agglutinative languages. In cases of infection by certain bacteria the blood serum has the power of producing defensive substances. Among these are the agglutinins which cause the infecting bacteria to adhere to one another in small masses or clumps and so deprive the organisms of their power of movement. While agglutination does not protect the body against disease, the reaction is valuable in the diagnosis of typhoid and para-typhoid fever, food poisoning, intestinal infections, cerebrospinal fever, and other bacterial infections. In typhoid fever, for example, a drop of diluted blood serum from the patient is added to a drop of a fluid culture of the typhoid bacillus. Examined under the microscope, the bacilli, which at first are widely distributed and moving freely, are seen an hour later gathered together in clumps, because of the action of the agglutinins produced by the typhoid infection. Agglutinins are specific for a particular infection; thus the serum of a typhoid patient will not agglutinate the organisms of cholera. *See* Bacteriology.

Aggradation. Term applied to the process by which rivers build up their beds and fill in their valleys. When rivers are overburdened with silt and flow over an almost level plain in a meandering course, the speed of the stream slackens to so great an extent that it becomes incapable of transporting the whole of the suspended mud, some of which is deposited on the bed and sides of the river. In time the deposits raise the bed and banks of the river above the surrounding level.

The lower courses of the Nile, Po, Mississippi, and Plate rivers are examples of this process.

Aggregate. Inert material combined with water and cement to form concrete. Except in certain special concretes (such as "no fines"), sand is used together with natural materials, like shingle, gravel, ballast, beach

pebbles, broken rock, and stone, or artificial aggregates such as broken brick, crushed slag, hard clinker, or coke breeze. Rock and stone aggregates are graded and sized according to a British Standard specification. For a light concrete which can be sawn and worked, sawdust is used as the aggregate. Foamed slag, which is steelworks furnace slag which resembles an artificial pumice, also makes a light concrete with good heat-insulating properties. *See* Concrete.

Aggtelek. Village of N. Hungary, in Gömör és Kis-Hont co., N.E. of Budapest. In the neighbourhood are the famous labyrinthine stalactitic caves, measuring, with side branches, over 5 m. in length, in which numerous prehistoric remains have been found.

Agha or **AGA.** Title used by the Turks for the chief of the janissaries, for military officers. and for the head eunuch. It is also used to some extent as a general term of respect. In Persia the spelling *Aga* is used, e.g. *Aga Khan*, *Aga Mohammed*.

Agheila, EL. Coastal fort of great military strength in Cyrenaica, 175 m. S.W. of Benghazi, protected on the E. by two large salt marshes, Sebkhah es Seghira and Sebkhah Gheizel, with a 15-m. gap of soft sand between them, including large areas of wind-blown crescent-shaped dunes; on the S. by a partly impassable escarpment, more sand dunes, and salt marshes; on the W. by another salt marsh, Sebkhah el Kebira. The farthest point reached, Feb. 8, 1941, during Gen. Wavell's advance into Libya, it was reoccupied March 24 by German armour after the withdrawal of Imperial forces. The British 8th army under Gen. Ritchie reached El Agheila again in Jan., 1942, but was driven E. by Rommel. In his retreat in Nov.-Dec., 1942, Rommel had no strength to make a stand at El Agheila, nor, with the opening of fresh battle-grounds in Tunisia, could he be reinforced with fresh troops; he therefore held it only long enough to compel the British to deploy in front of it, then retired to Buerat covering Tripoli. The 152nd bde. entered El Agheila Dec. 15. *See* North Africa Campaigns, and map in p. 6111.

Agincourt. British warship. The first of the name, a 64-gun ship launched in 1796, took part in the battle of Camperdown, 1797. In 1910 a warship of 27,500 tons was laid down for Brazil at

Elswick, to be called the *Rio de Janeiro*. After being launched in 1913 she was taken over by Turkey and renamed *Birinci Osman*. In Aug., 1914, when almost completed, she was appropriated by the British Admiralty, and named *Agincourt*. Commissioned for service in the Grand Fleet, she took part in the battle of Jutland.

Agincourt, BATTLE OF. Fought between the English and the French, Oct. 25, 1415. It takes its name, sometimes spelt *Azincourt*, from a village in the Pas-de-Calais, about 14 m. from St. Pol.

The English, under Henry V, had marched from Harfleur, and with some difficulty had crossed the Somme. They came into touch with the French about Péronne, and thence marched on parallel lines N.W. towards Agincourt. On Oct. 24, when they were closing in, the English being short of provisions, Henry offered generous concessions for permission to leave France, but these were rejected. After a wet night both armies were arrayed in battle order, the French "confident and over-lusty," the English sad and weary. The English were in three sections, vanguard, battle, and rearguard, but owing to numerical weakness, all were in line four deep with the archers in front. The French were crowded in three sections between Tramecourt and Agincourt, about 7,000 dismounted men-at-arms and a few cavalry forming the vanguard, wherein everyone clamoured to be in anticipation of victory.

The English opened the attack. Sir Thomas Erpingham gave the word "Now strike," and with a shout the whole line advanced. When near the foe they paused; to protect themselves against charging horsemen the archers drove sharp stakes into the ground and let go their arrows. The French vanguard then advanced, and, although the cavalry on the wings were foiled by the archers, the heavy mud, and the stakes, the footmen reached the English men-at-arms, and in hand-to-hand fighting King Henry was hit.

Soon, however, the French realized that they were worsted, and many surrendered where they stood. The victors advanced against the second line of their foes, but this and the third offered feeble resistance. The final stage of the battle was the plundering of the unguarded baggage of the English and a temporary rally by the French, events which

Agincourt. Map showing the route followed by the British force under Henry V, before the great battle of Oct. 25, 1415

led Henry to order the slaughter of the prisoners. After this he drove the remnants of the enemy from the field.

As to the numbers engaged, while the English may be put at about 9,000, the French are stated to have been 60,000 strong, but were probably 30,000. While the English losses were only a few hundreds, the French may have lost as many as 8,000, of whom 1,000 were made prisoners. See *History of the British Army*, J. W. Fortescue, vol. I, 1910.

Agio. Commercial term of Italian origin. It is the difference in value between the metallic and the paper currency of a country, and also that between the metallic currencies of different countries. For instance, if an English sovereign was only worth 19s. 6d., and was taken at this price in payment of debts abroad, the agio would be sixpence. It is not unlike the English premium. Originally the word meant accommodation, and referred to the price charged by Italian bankers when exchanging gold for silver.

Agira. Town of Sicily, in the province of Enna. It was formerly known as San Filippo d'Argiro, being on the site of the ancient Agrigum. It is one of the oldest cities of Sicily, is 35 m. N.W. of Catania and noted for its marble. Diodorus Siculus, the Greek historian and traveller, was born here. Pop. 22,485.

Agistment (Lat. *ad*, to; O. Fr. *giste*, lodging). Term in English law for the practice of hiring the right to graze cattle. The person who contracts to graze the cattle must take reasonable care of the beasts, or he is liable for damages. The agisted cattle cannot be seized for arrears of rent.

were rumours that they were to be disbanded or sent to Ireland. The agitators, who belonged to the rank and file, acted with the council of officers to resist the arbitrary acts of the Long Parliament; they obtained some money, but their main grievances were not redressed. They seized the king at Holmby House, and the army marched to London, but Cromwell restored order, and the agitators disappeared. The form adjutators arose from confusion with adjutants. Nowadays the word agitators is applied to leaders in certain political movements.

Agnano. Lake of Italy, drained in 1870. Situated 3 m. W. of Naples, it is in the crater of an extinct volcano. Near it are the sulphurous vapour baths of San Germano and the Dog Grotto.

Agnate (Lat. *ad*, to; *natus*, born). Term used in Roman law to describe persons related through descent from a common male ancestor. Cognates were persons related through descent from both male and female ancestors. The distinction was at first important, because succession to property depended upon it, but it was abolished by Justinian. See *Cognate*.

Agnel (Latin *agnellus*, little lamb). French gold coin struck in the time of Louis IX (1215-70), but not minted after 1574. It bore upon one side the emblem of the paschal lamb. See *Numismatics*.

Agnel. French gold coin of Philip IV, 1285-1314; $\frac{1}{2}$ of original size

Agitato. Musical term, derived from the Italian, and meaning restless or agitated.

Agitators OR **ADJUTATORS** (Lat. *agitare*, to act frequently). Name, merely meaning an agent, given in 1647 to the representatives chosen by the regiments of the New Model Army to present the grievances of the soldiers to the generals and to Parliament.

Their pay was heavily in arrears, and there

Agnello Pass. Mountain pass of the Asiago plateau, Italy. Here under enemy pressure the Italians were forced to withdraw their advanced position on June 29, 1917, having earlier captured the pass from the Austrians. See *Asiago Plateau*.

Agnes. Feminine Christian name derived from *agnus*, the Latin word for a lamb.

Agnes (d. 306). Roman saint, virgin, and martyr. She was beheaded at the age of 13 under Diocletian, and is commemorated on Jan. 21. A church in Rome is dedicated to her, her name is retained in the Church of England calendar, and her martyrdom is the subject of paintings by Tintoretto and other artists.

Agnes. Character in Charles Dickens's novel, *David Copperfield*. She marries David after the death of Dora. Agnes's father, Mr. Wickfield, in whose house David lodges while at Dr. Strong's school, is Miss Betsy Trotwood's solicitor, a gentle, honest man, with a weakness for drink, whom Uriah Heep seeks to ruin.

Agnesi, MARIA GAETANA (1718-99). Italian mathematician and linguist. She was born at Milan, daughter of a professor of mathematics at Bologna. At the age of nine she composed a thesis in Latin, and when thirteen knew Greek, Hebrew, and several modern languages. She displayed equal precocity in mathematics, being the author of two volumes on the analysis of finite quantities and the analysis of infinitesimals, not published, however, until she was thirty, and not translated into English until 1801. By the authority of Pope Benedict XIV she took her father's place as professor of mathematics at Bologna on his illness in 1750. After his death in 1752 she entered a sisterhood at Milan, where she became a nun, and died Jan. 9, 1799.

Maria G. Agnesi, Italian mathematician

Agnew. Family of art connoisseurs, dealers and publishers. They are now represented by the firm of Thomas Agnew and Sons, of London, Manchester, and Paris, the founder of which, Thomas Agnew (1794-1871), was mayor of Salford in 1851. Under the control of Sir William Agnew (1825-1910), the first baronet, and his brother Thomas, the reputation of the house greatly increased, and was maintained by William

Lockett Agnew (1858-1918) and other members of the family. The firm has carried out many negotiations for the National Gallery and other art galleries, and has often acted as expert advisers to the British Government. In 1870 the Agnews obtained, through marriage, an interest in

Sir W. Agnew, 1st Bt.
Bassano

Punch, and from 1890 William Agnew, as chairman of Bradbury, Agnew and Co., the proprietors of Punch, was closely identified with that periodical. He was also Liberal M.P. for S.E. Lancashire 1880-5, and for Stratford 1885-6. Until the middle of the 18th century the family, which claims descent from the Sheuchan (Stranraer) branch of Agnew of Lochnaw, resided at Clendry, in the parish of Kirkcolum, Wigtownshire.

Agni. In Hindu mythology, the god of fire. Prominent in Vedic hymn and legend, he is pictorially represented with two faces, three legs, and seven arms, and riding on, or accompanied by, a ram.

Agnomen. In Roman nomenclature, an extra name, added as a sign of service to the state or as indicative of some characteristic. Thus Scipio received the agnomen of Africanus as the destroyer of the African power of Carthage: while Fabius was called Cunctator (the delayer), in allusion to his waiting policy against Hannibal.

Agnosticism (Gr. *a*, not; *gnostikos*, knowing). Name given in 1869 by Professor T. H. Huxley (*q.v.*) to the doctrine, which he was by no means the first to state, that man does not know anything for certain about the spiritual world and existence, God, a First Cause, or the future life. Eternity and infinity, say the agnostics, are conceptions beyond the range of human understanding. Some maintain that they must always remain unknowable. The term was probably suggested to Huxley by the reference in Acts 17 to the altar at Athens dedicated to "an Unknown God" (*Agnosto Theo*).

Herbert Spencer was a leading exponent of agnosticism, and his *First Principles*, 1862, ranks with Sir Leslie Stephen's *An Agnostic's Apology*, 1893, Sir George Greenwood's *The Faith of an Agnostic*, 1919, and some of T. H. Huxley's essays as a classic exposition of

the agnostic standpoint. Agnosticism is to be distinguished from atheism, which denies the existence of God, as from theism, which asserts that existence. Nor are agnostics necessarily materialists, in the ordinary sense of the word as meaning those who believe only in the visible or ascertainable world of human experience. A spiritual world may exist, but the agnostic finds the evidence insufficiently conclusive, so keeps an open mind on the subject. But it is probably true to say that most agnostics disbelieve in the doctrine of free will, such is their regard for the principle of causation as seen throughout the universe. A critical analysis is Robert Flint's *Agnosticism*, published in 1903.

Agnus Dei (Lat. Lamb of God). Symbolic title given to Christ by S. John Baptist (John 1) in allusion to His atoning sacrifice. The representation of Christ under the form of a lamb bearing a banner or a staff headed with a Greek cross is of great antiquity in church art. The term is applied to the wax or silver medallions bearing the figure of a lamb, which are blessed and distributed by the pope on certain occasions, and is the name of a prayer in the Roman Catholic Canon of the Mass, placed after the Consecration and before the Communion. In the Holy Communion service of the Church of England the same prayer is often sung in English after the Consecration, and though not in the Prayer Book its legality was established in the case of *Read v. Bp. of Lincoln*, 1890.

Agonic Lines (Gr. *a*, not; *gonia*, angle). Two imaginary lines passing through places on the earth's surface where the magnetic declination is zero. At these places the compass points to the actual poles instead of N. or S. of them. One line passes through Eastern Europe, Arabia, the south of India, and the western part of Australia; the other from N. to S. of the American continent. See *Magnetic Declination*.

Agora (Gr. assembly). Originally used to denote the assembly of the people summoned by the kings of ancient Greece, the term came to mean meeting place. It was usually the central square of the city, corresponding to the Roman forum and the market place.

Agoraphobia (Gr. *agora*, market place; *phobos*, fear). Psychological condition in which the

individual manifests uncontrollable fear of open spaces, being, in severe cases, afraid to go alone into the street or to cross squares, fields, or parks. It is considered to be due to a complex of the unconscious mind and can be treated by psychological methods. It is the opposite of claustrophobia (*q.v.*).

Agordo. Town of Italy, in the prov. of Belluno. It stands on the river Cordevole, 15 m. N.W. of Belluno city, and was occupied by the Austrians in Nov., 1917, during their advance to the river Piave. Pop. 3,500.

Agoué. Seaport and town of Dahomé, French W. Africa. It lies W. of Great Popo, on the old Slave Coast.

Agouti, MARIE CATHERINE SOPHIE DE FLAVIGNY, COMTESSE D' (1805-76). French authoress, who wrote under the pseudonym of Daniel Stern (*q.v.*).

Agouti. South American and West Indian rodent of the genus *Dasyprocta*. The common agouti

Agouti. S. American rodent with back pair of curious three-toed feet

is about 18 ins. long and, though distantly allied to the guinea-pig, somewhat resembles a brown rabbit but without the characteristic ears. Dwelling in woods, and gregarious and nocturnal in habit, it is particularly destructive in sugar plantations.

Agra. City of India, in the United Provinces (*q.v.*) of Agra and Oudh. It stands on the right bank of the Jumna, 138 m. by rly. S.S.E. of Delhi. It is also connected with the latter by a canal, which leaves the Jumna 10 m. below Delhi and joins the Banganga some 20 m. below Agra. The city gives its name to a district, to a division comprising five districts, and to a province comprising seven divisions. The population of the city in 1941 was 284,149.

The most famous buildings are the fortress erected by the Mogul emperor Akbar in 1566, sur-

rounded by walls $1\frac{1}{2}$ m. in circumference and 70 ft. high, and containing the palace of Shah Jehan; and beyond the city to the E., the Taj Mahal (*q.v.*), completed by Shah Jehan in 1650 as a tomb for his favourite wife. Among many mosques and palaces the Moti Masjid and Jama Masjid are notable. British buildings include the government house, a medical and a teachers' training college, and barracks.

Agra is a busy commercial centre, manufacturing cotton, lace, shoes, carpets and mosaics, and serving as an emporium for wheat, barley, rice, tobacco, and sugar grown in the district. An affiliating and examining university was set up in 1927.

Under the Moguls, from 1566 to 1658, it was the virtual capital of India; and under the British in the 19th century it was capital of the North-West Provinces until superseded in 1861 by Allahabad. Captured successively by Jats, Mahrattas, and Moslems, it fell finally to Lord Lake in 1803. During the mutiny of 1857 it was besieged for several months.

Agram. Former name of the Yugoslavian town now known as Zagreb (*q.v.*).

Agrapha (Gr. *agraphos*, unwritten). Word used for reputed sayings of Jesus Christ not found in the Gospels and for certain sayings that, found therein, are thought to be interpolations. They include the sayings in Acts 20, v. 35, and 1 Cor. 7, vv. 10-12, and those found on papyrus at Oxyrhynchus by Grenfell and Hunt in 1897 and 1904, the genuineness of most of which is questioned. See Logia.

Agraphia (Gr. *a*, not; *graphein*, to write). A form of aphasia (*q.v.*) in which there is an inability to

communicate or understand ideas in writing. The patient may understand spoken words but not written or printed, though he has ordinary speech. It is a defect of the mental processes, due to brain damage, usually from apoplexy.

Agrarian Laws (Lat. *agrarius*, relating to land). Roman laws, the object of which was to ensure a fair distribution of the state domains (*ager publicus*, public land). These state domains, chiefly territory taken from conquered enemies, were from the first in the hands of the patricians, who paid at first a moderate rental, but later none at all. They remained state property, though holders could bequeath and sell them. The claim of the plebeians to a fair share of the land they had helped to win led to bitter struggles. By the Licinio-Sextian laws (367 B.C.) each person's holding was limited to 500 *jugera* (about 300 acres), and there were restrictions in regard to pasture-land. For a time this worked well, but the great wars ruined the small owners and led to the growth of large farms worked by slave labour, which, in the judgement of Pliny, "ruined Italy."

The Sempronian law (133) of Tiberius Gracchus imposed a maximum limit of 1,000 *jugera* for a single family, all in excess of this being broken up into

small allotments for the poor, inalienable, and leased from the state at a small rental. The still more radical proposals of Caius Gracchus in 123 were rendered valueless by that of Marcus Livius Drusus (122), which became law, legalising alienation of the holdings, which thus again passed into the hands of the wealthy. The Thorian law (119) assigned state domains as private property to holders on payment of a tax (later remitted). This put an end to all distribution of land among the poorer classes and destroyed the lower-class landed proprietors. No agrarian laws are heard of under the empire. See *Latifundia*.

Agrarians. Term applied generally to those interested in agriculture and to the agricultural population; specially applied to a political party in the second German empire, originating in 1876 as a society for the reform of taxation. When foreign corn began to

Fort and Delhi Gate of the city of Agra. The fort, which was built by Akbar in 1566, when Agra first became the capital of the Mogul Empire, is surrounded by walls a mile and a half in circumference and 70 ft. high. Above. View of the Taj Mahal, the beautiful and famous building which stands to the east of the city.

AGRA: AKBAR'S MASSIVE FORTRESS WALLS AND THE FAMOUS TAJ MAHAL

enter Germany in large quantities the Agrarians advocated protection; after 1893 they were influential within and without the Reichstag, and their insistence on subordinating everything to the interests of agriculture embarrassed the government; but as the Socialists grew stronger, the Agrarians became less powerful and merged with the Conservatives. *See* Germany: History.

Agreement (Lat. *ad*, to; *gratus*, pleasing). In English law an agreement presupposes two or more parties and a common intention; also that it is intended to affect the legal relations of the parties. Contract is one kind of agreement. There are others—e.g. marriage. An agreement to make a gift is not a contract. An agreement to do, or abstain from doing, or to pay money, is only enforceable if the agreement is a contract. *See* Contract.

Agreement of the People. English political manifesto of the Commonwealth period. In Oct., 1647, when negotiations were proceeding between Charles I and the Parliamentarians, the Levellers, the party in the army which disliked the rule of the Long Parliament, presented a manifesto to the Army Council. This demanded a redistribution of seats, a dissolution, and subordination, especially in foreign politics, of the executive to parliament.

An altered form of this agreement, issued by the Council in Jan., 1649, was presented to parliament on Jan. 20, ten days before the King's execution. This proposed a dissolution on April 30, 1649; the institution of biennial Parliaments, which should consist of one chamber; redistribution, and a franchise based on payment of rates. Royalists were not to vote for seven years and not to sit in parliament for fourteen. The Christian religion, which was not to be either popery or prelacy, but was to be reformed to the strictest puritan doctrine, was to be professed by the nation, and with this and six other matters parliament could not interfere.

Agricola, GEORG (1490–1555). Latinised name of the German scientist and author, Georg Bauer. Born March 24, 1490, at Glauchau, Saxony, he has been called by German writers the father of mineralogy. He studied chemistry, medicine, and physics at Leipzig; and, having taken his doctor's degree in Italy, returned to Germany and began practice as a

physician at Joachimsthal. Later he moved to Chemnitz. Prince Maurice of Saxony made him his historiographer. His principal work, *De Re Metallica*, published in twelve volumes in 1556, was long the standard work on mining and metallurgy. He died at Chemnitz, Nov. 21, 1555.

Agricola, GNAEUS JULIUS (A.D. 37–93). Roman general and administrator and governor of the Roman province of Britain. In A.D. 59 he served with the Roman army in Britain, and saw further service in Asia, again in Britain, and in Aquitania. Governor of Britain 78–86, he was recalled to Rome by Domitian. Agricola is the subject of a biography by his son-in-law Tacitus, the Roman historian. This claims for him a record as a conqueror and administrator which research has failed to confirm. He constructed a line of fortifications between the firths of Tay and Clyde, but the net effect of his conquests was to advance the Roman dominion only as far as York. His recall was probably due to the feeling that the results of the campaigns were not commensurate with his efforts. There is no evidence that he was poisoned, as was supposed, by the orders of Domitian.

Agricola, JOHANN (1494–1566). German Protestant reformer, also known, from his birthplace Eisleben, as Magister Islebius. His original name was Schneider or Schnitter. Educated at Wittenberg, he became a disciple and colleague of Luther. But his teaching as to the relative positions of repentance and faith provoked a violent controversy with Luther, who pronounced it Antinomianism, apparently coining the word. In 1540 Agricola went to Berlin, where he became preacher and general superintendent at the court of Joachim II, elector of Brandenburg. He made the first collection of German proverbs.

Agricultural Bureaux, IMPERIAL. British Commonwealth institutions designed as clearing-houses of information on research in certain specialised fields of agricultural science. There is an executive committee composed of nominees of the governments of the U.K., the Dominions, and India, and annual reports are submitted to each of the governments through their appropriate members. The bureaux, with the research institution to which each is attached, are: *Soil Science*: Rothamsted Experimental Station, Harpenden, Herts; *Animal Health*:

Veterinary Research Laboratory, Weybridge, Surrey; *Animal Nutrition*: Rowett Research Institute, Aberdeen; *Animal Breeding and Genetics*: Institute of Animal Genetics, Edinburgh University; *Plant Breeding and Genetics*: Plant Breeding Institute, Cambridge University; *Pastures and Forage Crops*: Welsh Plant Breeding Station, Aberystwyth; *Horticulture and Plantation Crops*: East Malling Research Station, Kent; *Agricultural Parasitology* (Helminthology): Institute of Agricultural Parasitology, St. Albans; *Forestry*: Imperial Forestry Institute, Oxford; *Dairy Science*: National Institute for Research in Dairying, Shinfield, Reading. The executive council of the bureaux is also responsible for the administration and finances of the Imperial Institute of Entomology, Natural History Museum, London, S.W., and of the Imperial Mycological Institute, Kew, Surrey.

Agricultural Gangs. Gangs of women and children, usually taken from the workhouses and hired out to farmers to toil on the land. They were in charge of a gangmaster, who took them from place to place. The system was common in the earlier part of the 19th century, especially in Lincolnshire, Norfolk, Cambridgeshire, and the neighbourhood, where land had been recently reclaimed from the sea and local labour was difficult to obtain. The lot of these gangs was wretched, and in 1867, as the result of an inquiry, the Agricultural Gangs Act was passed. This forbade all children under eight to work in gangs and placed gangmasters under supervision, while an Act of 1876 made the restrictions still more severe, and the system soon died out. The gangs are described in Karl Marx's *Capital*.

Agricultural Hall. Building in Islington, London, between Upper Street and Liverpool Road. It was built in 1861–2, at a cost of £53,000, by members of the Smithfield Club. It covers nearly three acres of ground, and the main hall measures 384 ft. by 217 ft.: it has an arched glazed roof of 130 ft. span, and galleries 30 ft. wide. There is a minor hall, 100 ft. sq. The first cattle show was held here in Dec., 1862, and the hall was long used for the Naval and Military Tournament. During the Second Great War the hall was taken over by the Ministry of Supply, and suffered slight superficial damage from anti-aircraft fire.

Agricultural Holdings Acts.

Acts for giving greater security to agricultural tenants in England and Wales. The Agricultural Holdings Act, 1923, consolidated certain earlier Acts and formed a code for controlling the relations between landlords and tenants of agricultural land as from July 7, 1923. The Act does not cover all points arising between a landlord and a tenant. A great deal is left to what is called the custom of the country. Such custom may vary not only from county to county but also from district to district and from time to time. A custom may, however, be excluded by the contract of tenancy whereas any provision in a contract inconsistent with the main provisions of the Agricultural Holdings Acts is void.

A holding may be either wholly agricultural or wholly pastoral, or in part agricultural and as to the rest pastoral, or in whole or in part cultivated as a market garden. It does not include an allotment garden.

Agricultural land is not a holding unless it is let for a term of years or from year to year.

The Act is designed to promote good husbandry. The improvement of land is a slow process, and it is essential that a tenancy should be for a lengthy period so that the tenant may look ahead and be induced to carry out improvements to the land even though it may be years before any benefit can be reaped from them.

The Act contains two main sets of provisions designed to achieve its object. First, in order to give the tenant security of tenure, his tenancy can be ended only on long notice; second, even if the necessary notice is given the tenant is entitled to be compensated by the landlord for: (1) certain improvements carried out to the land; (2) any loss or expense caused to him by having to leave the holding.

SECURITY OF TENURE. Notwithstanding any provision in a contract of tenancy to the contrary, a notice to quit, whether given by landlord or tenant, cannot terminate the tenancy before 12 months from the end of the then current year of the tenancy. There are a few exceptions, *e.g.* when a receiving order in bankruptcy is made against the tenant.

Moreover, if a tenancy is granted for two years or more, the tenancy will not expire automatically at the end of the period for which it is granted. In order to end it

the landlord or tenant must serve a written notice to quit at least one year before the tenancy is due to end.

The combined effect of these provisions is that the landlord and tenant can both always look ahead at least one year and know that the tenancy will last for at least that time. The advantages to the tenant are obvious. The landlord benefits also in that he is given time to find a new and suitable tenant for his land.

COMPENSATION FOR IMPROVEMENTS. Improvements fall under three heads:

(1) Improvements requiring the consent of the landlord. These include any new, altered, or enlarged buildings, the construction of silos, the establishment of osier beds, the making of water-meadows and other irrigation works; the laying down of permanent pasture; the making of gardens; the making or improvement of roads or bridges; the making or improvement of water-courses, water receptacles, or works for applying water power or supplying water; the planting of hops, orchards, or fruit trees; the protection of young fruit trees; the reclaiming of waste land, warping or weiring; the erection of embankments or sluices; the erection of wirework in hop gardens; the provision of sheep-dipping accommodation; the removal of bracken, gorse, etc., in arable land.

(2) Improvements of which the landlord must receive notice, *e.g.* drainage operations.

(3) Improvements regarding which notice to the landlord is not required. Such are the addition to the land of fertilisers, either directly or through the agency of stock; the laying-down of temporary pasture, of which the seeds are sown more than two years before the tenancy determines; and the execution of necessary repairs to buildings.

The tenant must give the landlord notice of his intention to do the repairs and may carry them out only if the landlord fails to do so within a reasonable time.

COMPENSATION FOR DISTURBANCE. When a tenant is compelled to leave his holding, even on proper notice, he may be entitled to compensation for disturbance.

The amount of compensation is the loss or expense caused to the tenant in connexion with the sale or removal of his household goods, implements, fixtures, farm

produce and stock; but to avoid dispute the amount is computed at one year's rent unless the tenant proves that his loss and expenses exceed that amount. The maximum obtainable is two years' rent.

The tenant has no right to compensation for disturbance if (1) he is not properly cultivating the holding; (2) he is in arrears with his rent or has failed to remedy a breach of a term of his tenancy consistent with good husbandry or has materially prejudiced the interests of his landlord by committing an irremediable breach of such a term; (3) he has become bankrupt or compounded with his creditors; (4) he has failed to agree to arbitration as to his future rent; (5) he has, without good reason, failed to comply with a demand of the landlord to execute an agreement setting out the existing terms of the tenancy.

A tenant who has himself given notice ending the tenancy may with some exceptions claim compensation for disturbance if the reason for his notice is that the landlord has failed to agree to submit the amount of the future rent to arbitration. A claim to have an arbitration as to rent cannot, however, be made oftener than every two years.

In certain other events the right to compensation for disturbance is also lost—*e.g.* if the landlord has offered to withdraw the notice to quit and the tenant has unreasonably refused to agree; or if the tenant has not given notice of his intention to claim compensation at least one month before the end of the tenancy; or if the tenant has died within three months before the notice to quit. The landlord must have had a reasonable opportunity of valuing the goods, implements, fixtures, produce and stock, to be sold.

Where the value of a holding has been increased by the continuous adoption of a standard of farming which has been more beneficial than the standard (if any) required by the contract of tenancy, the tenant is entitled to further compensation representing the value to the incoming tenant. Likewise the landlord may recover from the tenant compensation if the value of the holding has deteriorated through failure by the tenant to cultivate according to the rules of good husbandry as defined in the Act. The compensation will be estimated by a single arbitrator, to whose appoint-

ment both parties agree, or who, in default of such agreement, is nominated by the ministry of Agriculture and Fisheries.

The Acts also contain provisions compensating a tenant for damage done to his crops by game, and others (1) entitling him, subject to certain conditions, to remove at the end of his tenancy fixtures, such as engines or fencing affixed to the holding by him; and (2) limiting the landlord's right of distress.

Some of the provisions of the Acts are slightly modified in their application to market gardens.

The Agricultural Holdings (Scotland) Act, 1923, consolidated certain earlier measures for the same purpose as in the case of England and Wales.

War-time Holdings

During the Second Great War it became necessary to plough much land which had not recently been used for agricultural purposes. The considerations which led to the passing of the Agricultural Holdings Acts did not arise in the case of temporary war-time tenancies of land of this kind, and accordingly such tenancies were for the most part excluded from the Acts by the Agriculture (Miscellaneous War Provisions) Acts, 1940 and 1943.

The urgent need for food made it necessary that land should be cultivated very intensively, and this often involved a wide departure from long-established agricultural practices. The ministry of Agriculture was therefore given the widest and most absolute powers, many of which were delegated to the war agricultural committee appointed by the ministry to replace the peacetime agricultural committees of the local councils.

The minister could give directions as to how land was to be cultivated, and if the directions were not obeyed he could compel the tenant to give up possession of the land. On a tenancy being terminated in this way the tenant was entitled to compensation for improvements but not to any compensation for disturbance.

When a landlord or tenant gave notice to terminate the tenancy the committee had to be informed.

When a tenant was directed to plough up permanent pasture, any liability under his tenancy agreement or any custom or rule of law to sow it again or pay increased rent or a penalty was extinguished.

Where, to comply with directions, he had removed bracken, gorse, etc., he was entitled to compensation for the improvement, even if the landlord had not consented as required by the Agricultural Holdings Acts.

Agricultural Labourer. One who works on the land for weekly wages. According to estimates there were in June, 1948, 689,000 male (excluding prisoners of war) and 129,400 female (excluding the W.L.A.) agricultural workers in the U.K.

Owing to low wages, bad housing, long hours of labour, and a general lack of the amenities of life, and to the facts that they had no proprietary interest in the soil and no prospects of material advancement, agricultural labourers for long were regarded as the poorest and most depressed class in the social system. They alone had little or no share in the great social advances of the 19th century. According to an official return issued in 1910 their average wages were then only 17s. 6d. a week, 14s. 6d. in cash and the balance in kind.

One remedy for these ills, the formation of a strong trade union of agricultural labourers, was unsuccessful in the 19th century. The prospective members were isolated, poor, and timid; moreover, conditions varied greatly in different districts. One such union broke up in 1872 through the pressure of adverse circumstances. However, there was a revival of agricultural trade unionism in 1906. Though the total income for the first full year was only £166, the figure had risen to £87,000 in 1943, when the union claimed 2,100 branches. The union is represented on all public bodies connected with agriculture, and hundreds of its members serve on parish, district, and county councils. Its aim is to establish the right of the farm worker to a standard of life equal to that of other workers.

Meanwhile various schemes of improvement have been put forward by politicians and social reformers. The Corn Production Act of 1917 established an Agricultural Wages Board by which wages are fixed. This board is a department of the ministry of Agriculture and Fisheries. Wages formerly varied considerably from county to county. The average minimum for England and Wales was in 1939 35s., and in 1945 70s., a week. In 1949 the board established a minimum of 94s. for men, 71s. for women.

Agricultural Research Council. British official body incorporated by Royal charters in 1931 and 1933. It consists of agricultural experts appointed by the government and charged with the tasks of advising the development commissioners and the agricultural departments upon the application of moneys voted by parliament for the furtherance of agricultural research, and the promotion of research with the aid of funds voted by parliament and received from private sources, societies, etc. The council's field station is at Compton, near Newbury, Berks.

Agricultural Society. Association of farmers and others connected with the land for the furtherance of common aims.

The oldest existing organization of the kind in Great Britain is the Bath and West of England Agricultural Society, which extended its operations to the southern counties and to Wales. It was founded in 1777 for the encouragement of agriculture, arts, manufactures, and commerce in Somersetshire, Wiltshire, Gloucestershire, and Dorset, and the city and county of Bristol. The society has rendered great services to agriculture by holding shows and meetings, awarding prizes for stock and produce, issuing publications, and retaining experts for the assistance of its members.

The Highland Society of Scotland was founded for similar ends in 1784, obtained a charter in 1787, and changed its name to the Highland and Agricultural Society of Scotland in 1834, when a new charter was obtained. Before 1881 the society played an important part in veterinary training, and from 1856 to 1900 conferred agricultural diplomas.

The Royal Agricultural Society of England, founded as the English Agricultural Society in 1838, was so styled by a charter granted in 1840. Its famous shows are the largest of the kind held in Britain, each year at a different centre, and the addition of a horticultural section has proved a special attraction. The annual journal is of high standard, and the society has published several editions of a standard text-book, W. Fream's *Elements of Agriculture*. It also issues technical leaflets and pamphlets from time to time. The Royal Dublin Society, founded in 1731 and granted a charter in 1749, is the Irish equivalent of the Royal Agricultural Society.

AGRICULTURE: HISTORY AND PRINCIPLES

LORD BOYD-ORR, Director-General U.N. Food and Agriculture Organization, 1946-48

This general article surveys the development, social, economic, and administrative, of mankind's most essential industry from primitive times to the age of mechanisation and scientific research. For information on methods, see Cattle; Dairy Farming; Farm; Ley Farming; Pasture; Poultry; Sheep, etc.; also articles on Crops; Food and Nutrition; Food and Agriculture Organization; Manure; Root (Crops), etc.

Agriculture (Latin *ager*, a field; *cultura*, tillage) is the basis of civilization. Primitive man depended for his food on natural vegetation and the chase, and hence human society was limited to small tribes moving from place to place in search of food. The development of agriculture led to the permanent settlement of communities in the areas where food was grown and so to the rise of cities with a relatively secure food supply all the year round, making possible conditions favourable to discovery and invention, with resulting growth of civilization. Agriculture continues to be the foundation on which civilization rests. The products of the soil, e.g. food and raw material for clothes and many other commodities, still supply the primary necessities of life and exceed in value the products from all other sources.

Even with the great development of other industries, there are still more people in the world engaged in agriculture than in all other occupations put together. Nor is there any likelihood that the importance of this basic industry will decrease, at least in the immediate future. The carrying-out of the recommendations of the United Nations Food and Agricultural Conference of 1943 was to involve doubling world production of the more expensive agricultural products. This would have far-reaching social and economic consequences.

Prehistoric Agriculture

The beginnings of cultivation and the domestication of animals occurred some time between 20,000 and 10,000 B.C. It may be assumed that the use of grain as food occurred earlier. Wheat grew wild in Eastern Asia and in the great Mediterranean Valley, now the Mediterranean Sea, and it is most probable that primitive man learned to knead and pound the seeds for food long before he learned to grow it. The origin of cultivation was the discovery that seeds buried in the ground reappeared as living plants bearing seeds of the same kind. This new conception must have had a profound effect on the myth-making mind of primitive man. Rituals

became associated with seedtime and harvest. Among the Neolithic peoples, sowing was traditionally associated with the offering of a human sacrifice, usually of the finest youth or maiden in the tribe.

For many centuries progress in cultivation was slow. About 5000 B.C. a rapid development began in both Egypt and Mesopotamia. The earliest actual evidence of systematic cultivation consists of wheat grains found in pre-dynastic tombs in Egypt and early Sumerian dwellings in Mesopotamia, dating in both cases from about 3500 B.C. The Sumerian grains are assigned by experts to be the highly developed species of *Triticum compactum*, thus indicating that even by this time selection of seed for the improvement of the crop had been already well established. It is probable that artificial irrigation was practised as early as this.

Egypt, Greece, Rome

By the time of the Egyptian 5th dynasty (c. 2750 B.C.) and that of Hammurabi in Babylonia (c. 2120 B.C.) agriculture had become a highly developed industry. The stone axe used as a crude hoe and other primitive tools had been replaced by ploughs, seed drills, and other agricultural implements not unlike those used in the most advanced countries until about the 18th century. In Egypt the main crops were wheat, barley, millet, peas, beans, and edible roots. The principles of manuring were understood and practised. Cattle were selected for breeding. The land was divided into great estates worked by slaves. In Biblical times the Israelites were a great agricultural nation. The land was regarded as being held direct from Jehovah. It was parcelled out among 600,000 occupying owners, and the holdings could not be alienated by debt. The land was well watered by irrigation and enriched with manures. It is described in 2 Kings 18 and 32 as a land of "corn and wine, a land of bread and vineyards, a land of olive oil and honey."

An account of agriculture in Greece is given by Theophrastus (3rd century B.C.), the first writer on botany. He describes the mix-

ing of soils, manuring, and other agricultural projects in vogue in his time. In the 5th century B.C. more than half of the Athenian citizens were owner-occupiers. A normal-size farm included about 30 acres of arable land, 4 or 5 acres of vines and olives, and some orchard and pasture. In addition to these farms a large number of agricultural labourers were the holders of small plots.

Descriptions of Roman agriculture are given by Cato, Varro, and Virgil (2nd and 1st century B.C.). In the early days of the Republic a high proportion of the citizens of Rome were working farmers. A typical Roman farm in the 1st century B.C. was one of about 150 acres worked by the owner with a bailiff and farm hands who were slaves. It was a system of mixed farming with a variety of crops and cattle, sheep, and pigs. The Romans were skilful farmers. They practised fallowing to rest the land and a good rotation with legumes to enrich the soil in nitrogen, though, of course, the means whereby the legumes enriched the soil were unknown. They grew green crops and ploughed them in as manure, irrigated the land, and were careful in the selection of seed for the improvement of crops. As the wealth of Rome increased, however, under the Emperors, supplies of grain were brought from Sicily, Sardinia, and Africa. The small farms were merged into large estates (*latifundia*) worked by slaves and used mainly for grazing and for the large-scale production of wine and oil.

The Middle Ages

After the fall of Rome agriculture deteriorated, and throughout the Dark Ages in Europe both the science and practice of the industry were at a lower level than that which was attained in the Mediterranean civilization at the beginning of the Christian era. A notable exception was found in Spain, occupied by the Moors. There agriculture reached probably the highest level which had ever been attained by that date, a level not surpassed by any Western European country until the 18th century. An account of the science and art of farming in

Spain, including such advanced science as plant diseases, is given by the Moorish writer, Ibn-al-Awam (12th century).

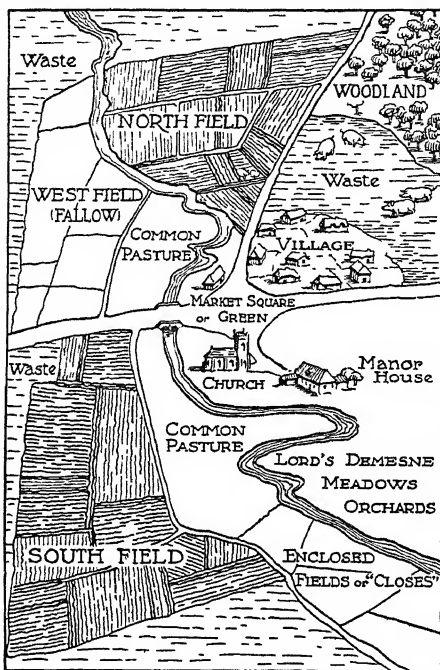

In Western Europe in the first 3 or 4 centuries B.C., apart from the villas of the Romans, agriculture seems to have been based on the common ownership of the land by the people, who lived together in small hamlets of usually 10 to 20 families, though some contained as many as 100 families. Families cooperated in cultivation. In medieval Europe a feature that emerged from the Dark Ages following the fall of Rome was the predominance of the great proprietor, the *dominus* or lord. Under Charlemagne cultivated land was in part reserved for the lord's profit and in part granted to the serf in return for ploughing and reaping services on the lord's reserve. The tenure of land became the basis of military service, and thus the feudal system emerged.

At the outset of the feudal period in England the bulk of the population were peasantry or serfs (villeins), who formed village communities, the unit of land holding and cultivation being the manor.

There was common pasture and there was also village arable land, consisting of unhedged areas many acres in extent, divided into three sections or "fields," one of which was left fallow each year. Land belonging to each villager was divided into numerous small separate strips spread all over the area, perhaps to secure equal productivity. The strips were from one to one-and-a-half acres each, separated by a furrow or ridge (a balk).

This form of strip farming and common cultivation disappeared very gradually and some medieval strips still exist in England today. Soil was improved by the use of marl, by ploughing in the stubble, and by pasturing herds on the arable land after harvest. The chief crops were wheat, rye, oats, barley, peas,

beans, and vetches. Two bushels of wheat or rye were sown per acre, and the yield was only about 10 bushels. About 10 bushels of oats or barley were sown, giving a yield of 12-16 bushels. The grazings consisted of natural grasses and weeds. Artificial grasses and clovers were unknown, and there were no root crops. Hay was cut in the meadows for winter feed, but it was of poor quality.

Agriculture. Manorial system of the Middle Ages: two great "fields" were divided into strips, a third was left fallow. There were also common pastures and "closes" in individual occupation

The dead weight of cattle was only about 300 lb. and of sheep about 28 lb. Owing to the lack of winter feed, cattle to be used for beef were killed and salted in the autumn. Swine, which were plentiful, had to subsist mainly on what they could forage in the woods. Hens and geese were plentiful, and the lords kept great flocks of pigeons in dovecotes, both for eating and for manure. The pigeons which lived on the grain were a great source of grievance to the villagers. Wheat and rye were used for bread, rye being the peasants' chief bread. Barley was used for brewing. Oats were grown extensively in the north of England and in Scotland, but less on the tenants' land in the south.

The manors were largely self-contained. There was little

surplus for sale. The lord of the manor got such money as he needed mainly from the sale of livestock and their produce. The completion of the harvest was an occasion for general rejoicing and merriment because it meant a food supply for the winter was secured. In years of bad harvest there was often a scarcity approaching famine. In 1315, owing to incessant rain during the summer, the harvest was so poor that it was followed by a dreadful famine accompanied by pestilence. Poor harvests, followed by food shortage and high prices, occurred not infrequently until the 19th century, when home production began to be supplemented by imports. On three occasions as late as the 18th century, failure of the harvest in Scotland was followed by the death of thousands of people through starvation.

The manorial system began to decline in the 13th century, when, by the Statute of Merton (1235), the lords were allowed to enclose land provided they left sufficient common land unenclosed to meet the needs of the commoners. The lords began to commute services for payment in money or in kind with which they hired labour for work on their own land. Villeins thus became tenants. This led to an increase in productivity, because the tenant, in addition to providing for his own needs, had to provide a surplus for rent. Part of the surplus was sold by the lord, thus increasing the trade in corn.

The breakdown of the manorial system was accelerated by the Black Death which raged in 1348-49, carrying off nearly half of the population. This caused a great shortage of labour. Wages rose, and serfs found it easy to escape from their masters and get employment on other estates as free men. The Statute of Labourers in 1349 fixed wages at the 1346 level. The resulting discontent led to the Peasants' Revolt in 1381. The labour problem was partly solved by abandoning the wasteful manorial system. The separate strips belonging to individual holders were collected into one unit and enclosed with a hedge. This economised labour. A further saving of labour was made by converting cultivated land to grazings for sheep, which were highly profitable owing to the great and constant demand for wool for export to Flanders.

The enclosure movement, which began in a small way in the 14th

century, continued and reached its peak between 1700 and 1845. The enclosures caused serious discontent among the villagers deprived of their land. In some districts they revolted. A serious revolt occurred in East Anglia in 1547. When the enclosure was carried out by holders who collected the strips into one unit by agreement, the development was beneficial and there was no discontent. Indeed, the change from the wasteful open-land cultivation in strips to enclosed fields was essential to the development of modern efficient agriculture. But the enclosure of common lands and the eviction of peasants with inadequate or no compensation for the sake of the profits to be made from sheep has been condemned by most writers. Hundreds of Acts of Parliament dealing with enclosures were passed, most of them promoted by landlords to legalise their action. In 1845 an Act was passed which was designed to safeguard the interests of peasant-holders, but by that time it was almost too late, for practically all the agricultural land in the country had already been enclosed.

Enclosed fields under the continuous control of one individual made possible the carrying-out of experiments with improved methods. Early in the 18th century a number of landlords began

Agriculture. Jethro Tull (1674-1741), who gave up his career at the bar to study and practise farming
Royal Agricultural Society

experimenting with new crops and new methods of cultivation, and in the 18th and 19th centuries agriculture, which up to the end of the 17th century had changed little since the Dark Ages, underwent a revolution almost as drastic as the Industrial Revolution.

New Men and Methods

The first great pioneer was Jethro Tull. He showed that the yield of crops could be increased by proper cultivation to eradicate weeds. He is also credited with

inventing the seed drill to replace the wasteful method of broadcast sowing. A primitive form of seed drill, however, was in use long before his time. More important innovations were introduced by Lord Townshend, who left politics in 1727 to devote himself to the improvement of his estate in Norfolk. He introduced artificial grasses and clovers and the turnip crop and showed that a rotation of crops, e.g. wheat, turnips, barley, and clover, kept the land in better condition than the old wasteful method of leaving land fallow for a year.

The improvement in pastures and the use of turnips for winter feed was followed by a remarkable increase in the weight of cattle and sheep. The average weight of cattle rose from about 350 lb. at the beginning of the 18th century to 800 lb. at the end of it, and, of sheep, from 28 lb. to about 70 lb. In Roxburghshire the increase in the size of the cattle fed on the new pastures in summer and on roots and straw in winter was so great that some people regarded them as unnatural "monsters" and were afraid to eat the beef from them.

The improvement in feeding was accompanied by an improvement by selective breeding. Robert Bakewell produced the famous Leicester breed of sheep

Agriculture. These engravings by David Loggan, dating from about 1675, are of the country round Cambridge in pre-enclosure days. The lower view shows corn being reaped by the village farmers, while above is a field from which the crops have been gathered, leaving it free for huntsmen and the peasants' livestock

and Robert Colling the famous Durham cattle. A demonstration of how these new ideas worked out in practice was given by several landowners, the most noteworthy of whom was Thomas Coke, whose estate in Norfolk became famous and attracted many visitors. These improvements, which occurred in localised areas, took a long time to spread over the whole country. Arthur Young, though a failure as a practical farmer, grasped the significance of the new ideas and had a gift for exposition. He travelled widely throughout England and the Continent. In 1784 he began to publish the *Annals of Agriculture*, and in 1793 became the first secretary to the Board of Agriculture. His lectures and writings disseminated the new knowledge. Towards the end of the 18th century agricultural societies began to be formed. These promoted improvements by holding agricultural shows and demonstrations and arranging for lectures and publications. By the middle of the 19th century modern methods had replaced medieval methods on most farms.

Science and Mechanisation

The latest development has been the application of modern science to increased agricultural efficiency. Early in the 19th century Liebig, on the Continent, analysed plants to find out what substances were needed to promote their growth. The Board of Agriculture employed Sir Humphry Davy to give lectures on agricultural chemistry. Lawes started experimental work at Rothamsted in 1835 to show the effect of artificial fertilisers. The results were so striking that phosphates, potash, guano, and other nitrogenous substances gradually came into general use.

Agricultural research on a big scale, however, did not begin until the 20th century. In 1911 the Development Commission, which had been set up to promote rural industries, set aside part of their funds to promote the establishment of agricultural research institutes in different branches of agricultural science. About a dozen of these have since been established. As a result of the work of these and other institutions, in both Great Britain and other countries, there has been a marked improvement in agricultural production in the last few decades. Thus, for example, new strains of plants, giving higher

yields and, in many cases, with a higher resistance to disease, have been bred and rapidly brought into general use. Better types of grasses and clovers have been introduced, with resulting improvement of pastures and increased fertility of the soil. In animal husbandry the new science of nutrition has been applied to the elimination of diseases due to the deficiency of vitamins and minerals, and to improved methods of feeding, leading to increased yield and greater resistance to disease. Great advances have been made in the treatment and control of some diseases of both animals and plants, though disease of one kind and another is still the cause of enormous losses.

The result of all this application of science has been to increase potential food production. It is estimated that the full application of the best agricultural methods could lead to the production of as much as is at present being produced in the world on half the area under cultivation, and that we have now the knowledge to produce sufficient food to feed three times the present population of the world.

An almost equally important contribution which science has made to agriculture is mechanisation. In 1799 a mechanical reaper was invented. Later there appeared a reaper and binder, and then, finally, the combine harvester which cuts and threshes the grain in one operation. The tractor is now rapidly replacing horses. Milking machines, electric incubators, and new and improved implements for practically all kinds of farm operations have been introduced in the last two or three decades. It has been estimated that in wheat production one day's labour by the most modern methods is equivalent to about a month's labour by the 18th century methods. The rise in wages of farm workers has accelerated the adoption of every possible labour-saving device.

Other Countries

The foregoing account of the development of agriculture in the last two or three hundred years is based mainly on what took place in England. In all countries, developments, so far as they have taken place, have followed roughly the same general course. In Scotland, until towards the end of the 18th century, improvements lagged far behind those in England, but when the change-over to modern methods did begin they moved

much more rapidly, and towards the end of the 19th century agriculture in Scotland was on the whole more efficient than in England and both beef and dairy cattle excelled in quality. Denmark, during the 19th century, developed a highly efficient agriculture, especially in dairying, pigs, and poultry, from the products of which they had a large export trade, mainly to England. Agricultural developments in Holland preceded those in England. Indeed, many of the improvements introduced by English agricultural pioneers were imported from Holland, which still excels, especially in dairying and in market gardening. In France the small size of the holdings has delayed the introduction of mechanisation. In Eastern European countries agriculture is not so well developed as in England. North America led the world in mechanisation, but the yield per acre of grain crops is less than in England, where more intensive methods, with a more liberal use of fertilisers, are practised.

In the U.S.S.R.

In Asiatic countries, where the great bulk of the population is still engaged in agriculture, some of the methods are more primitive than those in use in Rome and Greece in classical times. In Soviet Russia a revolution in agriculture has taken place since about 1925. Very large communal farms have been established and rapidly mechanised. In agricultural research, especially in soil science and plant breeding, Soviet Russia is, in some respects, in advance of all countries. Artificial insemination as a means of rapidly improving the breed of cattle, etc., which was introduced in Russia in pre-war days, has been so successful that it has since been introduced in England. There are thus in the world today all gradations of efficiency in agriculture, from the most modern farms with high yields and high output per man hour to the most primitive methods which have not changed for 2,000 years.

The problem of how to produce food in abundance has been solved, but there remains the difficult economic and political problem of adjusting agriculture to modern world conditions. In subsistence agriculture, where most of the food produced is consumed locally, prices are of less importance than the fluctuation in yield due to climatic factors, but as the trade

1. Guiding an old-fashioned plough drawn by horses, a crofter near Stornoway plods along the furrow he has just cut. 2. A Ransome six-furrow plough drawn by a caterpillar Diesel tractor. 3. Single roller, horse-drawn. 4. Triple roller drawn by a tractor. 5. Laborious hand-watering of a crop threatened by drought. 6. Multiple spray installation on fields at West Drayton

Photos, 1, Topical; 2 and 4, *Farmer's Weekly*; 3 and 6, *Planet News*; 5, *Fox*

in foodstuffs grew, prices became of paramount importance, and they have always fluctuated often violently. This is especially true of wheat. Thus, for example, in 1709 wheat in England was 81s. a quarter; in 1732 it had fallen to 24s. In the 19th century it fluctuated between 126s. and 22s. 10d. When the price of food goes up, the poverty of the poor, who spend the greater part of their total income on food, increases. On the other hand, a sudden fall in prices brings ruin to the farmer who has difficulty in reducing his cost of production.

This rapid fluctuation in prices, with resulting social and economic evils, runs through the history of agriculture since medieval times, and is still unsolved. Several attempts were made by Parliament to stabilise the price of grain at a level profitable to the farmer by measures such as import duties, tariffs, subsidies for export, or price-fixing. Until the outbreak of the Second Great War governments were groping after a solution of this difficulty. It had been realized that the fall in prices affected more than the farmer. The decrease in his purchasing power led to a decrease in the prosperity of industry and trade. The difficulty is always increased by the incidence of war, when there is a rise in prices followed by a post-war slump.

Controlling the Market

Prices rose during the First Great War, but from 1920 onwards prices fell and some foodstuffs became almost unsaleable. Some countries imposed tariffs to prevent the importation of cheap food, and the internal price was sometimes double the world price. In Great Britain and the U.S.A. measures were taken to control production. In Great Britain agricultural marketing boards were set up under two Acts of Parliament (1931 and 1933), giving producers power to control the amount marketed and to fix the price. Wheat-exporting countries tried to make arrangements for each to reduce production according to an agreed ratio. These measures, designed to adjust production to economic demand, tended to stabilise the industry.

The position was complicated, however, by the new science of nutrition which showed that even in the relatively wealthy countries, like Great Britain and the U.S.A., a third of the population did not have sufficient of the right kind

of food for health and that the main reason for this was poverty. Thus two contradictory policies were urged, one for reducing production and raising prices in the interest of farmers, the other for increasing production and lowering prices in the interest of public health.

In Great Britain the milk-schools scheme (1934) served to absorb a considerable amount of the surplus liquid milk. In the U.S. the Food Stamp plan (1939) enabled low-wage earners and unemployed to purchase certain foods at half-price. This achieved the desired object of putting the so-called glut of food into empty bellies. Various measures of this kind were adopted as temporary expedients to reconcile the interests of producers and consumers. In 1935 the assembly of the League of Nations discussed the world food position in relation to the interests of agriculture, public health, and trade, and considerable progress was made in evolving a new policy designed to bring about what has been called "the marriage of health and agriculture."

The Second Great War

When the Second Great War broke out, Britain adjusted its agriculture to the food requirements of the people. Home production *plus* imports were planned to provide, as far as possible, the food needed to maintain the health of the whole population. To increase home production, farmers were offered a guaranteed market at a guaranteed price much above the pre-war level. By rationing, subsidising food to the extent of over £200 million p.a., and making provision for the special needs of mothers and children, and of heavy workers, distribution was based on the nutritional needs of different classes of the population.

This war policy of production for consumption and distribution according to nutritional needs brought prosperity to farmers and a marked rise in the standard of living of farm workers. In spite of the scarcity of some foods, the equitable distribution, with retail prices within the reach of every family, resulted in a definite improvement in the state of nutrition of the poorest third of the population.

The present trend of thought is that the principles of the war food policy, with modifications to suit peace-time needs when food is more abundant, should be the permanent food and agricultural

policy, as the one most likely to benefit public health and to bring permanent prosperity and stability to agriculture.

Agriculture and Fisheries, MINISTRY OF. Department for supervising these industries in England and Wales. A Board of Agriculture was established in 1889 to take over duties previously performed by the Privy Council and by the Land Commissioners then abolished. In 1903 the supervision of fisheries was transferred to it from the Board of Trade, and it was known as the Board of Agriculture and Fisheries. It was constituted a ministry in 1919, and on Jan. 9 following its first head was appointed. The minister now holds cabinet rank, is responsible to Parliament, and is assisted by a parliamentary, a permanent, and a second secretary.

For administrative purposes the work of the department is divided into the following categories: (1) Agriculture, including statistics, economics, and trade relations; produce and subsidies; local organization, small-holdings, and allotments; man power and wages; supplies, foodstuffs, livestock, and machinery; land drainage; animal health; technical, education, horticulture, and publications; intelligence; and special inquiries. (2) Wales and Monmouthshire. (3) Fisheries, including scientific investigation. (4) Royal Botanic Gardens, Kew, Surrey, under a director. (5) General, including the establishment and finance divisions and the legal branch. (6) Ordnance Survey, with headquarters at Southampton, under a director-general (a military officer).

Scotland has its own Department of Agriculture, established as a board in 1911 to take over work previously discharged by the Crofters' Commission and the Congested Districts Board. There is also an Inspectorate of Fisheries under the Scottish Home Department. Northern Ireland has a cabinet minister in charge of agriculture. In each of the British Dominions a responsible minister of agriculture is included in the government; and in Canada every province, and in Australia every state, has a similar minister in its cabinet. See Kew Gardens; Ordnance Survey.

Agriculture, CENTRAL AND ASSOCIATED CHAMBERS OF. Society for protecting the interests of agriculture. In England and Wales a central Chamber of Agri-

culture was founded in 1866. With this numerous local chambers are associated. Its avowed object is to watch over all measures affecting the agricultural interests before Parliament, and to take such action, both in and out of Parliament, as may seem desirable for the benefit of agriculture. Agricultural and dairy associations other than local chambers are included in the federation. Scotland is organized on similar lines. In June, 1918, the Council of the Central and Associated Chambers of Agriculture adopted the constitution of a National Agricultural Council, consisting of representatives of the Agricultural Organization Society, the Central Association of Agriculture, the Central Chamber of Agriculture, the National Farmers' Union, and other such bodies.

Agriculture, INTERNATIONAL INSTITUTE OF. Organization intended to provide agriculturists in all parts of the world with a knowledge of crop conditions and supply of farm products (more particularly those which enter into world commerce, e.g. cereals and cotton) that will help them to adjust supply to demand. The idea was conceived by David Lubin, a Californian merchant. Finding little support in the U.S.A., he went to Europe, where he won the sympathy of King Victor Emmanuel III of Italy; and in 1908 the Institute was opened in Rome. Its chief work was the collection of statistics, which were published in monthly bulletins and in special reports. From time to time meetings were held in Rome, under the In-

Agrimony. Flowering spike and leaves of the wayside plant

stitute's auspices, of delegates appointed by the governments forming the union, and before the Second Great War the I.I.A. had come to be widely recognized as the principal source of information on the world's agriculture, seed breeding, soil chemistry, etc.

Agrigento. City and port of Sicily, on the S. coast, known before the Fascist period as Girgenti, and in ancient times Agrigentum or, according to the Greeks, Akragas. Founded by colonists from Gela about 581 B.C., it soon acquired both wealth and territory, and had, it is said, at one time a population of 200,000. Agrigentum had many handsome temples, that of Jupiter being one of the finest in Sicily. The Carthaginians destroyed the city in 405, but it was rebuilt by Timoleon in 340. It was sacked during the first Punic War, and again in 210 B.C. But it remained a great trading centre for several centuries, among the commodities dealt in being sulphur from the neigh-

bouring mines. It has medieval walls, a 14th cent. cathedral, and catacombs. Sulphur, salt, grain, oil, fruit, etc., are exported through Porto Empedocle. During the Anglo-American invasion of Sicily in July, 1943, U.S. warships bombarded Agrigento, and after 24 hrs. of confused fighting, the city surrendered to U.S. troops, July 16. Over 4,000 Italian prisoners were taken.

Agrimony (*Agrimonia eupatoria*). Small perennial herb of pastures and waysides. Its leaves are broken up into pairs of coarsely toothed leaflets, alternately large and small—in botanical language the leaf is interruptedly pinnate. From June to Aug. it sends up a tall, flowering spike, 2 ft. or 3 ft. in height, bearing numerous small yellow flowers and top-shaped fruits with hooked prickles. The rootstock yields yellow dye.

Agrippa. The name of two Idumean rulers of Judaea under the Romans. Agrippa I, grand-

Agrippa I. Coin showing his portrait on the obverse

son of Herod the Great, killed James, son of Zebedee, and cast Peter into prison. He reigned with much pomp and met with a horrible death at Caesarea, described in almost identical terms by Josephus and in Acts 12. His son, Agrippa II, with his sister Berenice, heard Paul's statement before Festus at Caesarea, and was "almost persuaded to be a Christian." (Acts 25-26.) After the fall of Jerusalem he returned to Rome, where he died A.D. 100, the last of the Herodians.

Agrippa, MARCUS VIPSANIUS (63-12 B.C.). Roman general and statesman, friend and confidant of Octavian, afterwards the Roman emperor Augustus. During the civil wars following the death of Caesar, in which Octavian had to fight for the mastery of the Roman world, Agrippa conducted a successful campaign in Gaul in 38 B.C.; effectually checked the menace of Sextus Pompeius by his naval victory at Naulochus in 36; and commanded the fleet at the decisive battle of Actium in 31. His military activity continued after Augustus became emperor,

Agrigento. The Temple of Concord, one of the most perfect of the surviving examples of Hellenic architecture, in this ancient city in Sicily

Agrippa. Roman general
Capitoline Museum, Rome

and he conducted successful campaigns in Gaul, Spain, Pannonia, and Syria. Agrippa was responsible for many public works at Rome and was a generous patron of art and letters. He had much to do with the survey of the empire, begun by Julius Caesar and completed under Augustus. His third wife was Julia, the emperor's daughter.

Agrippina (d. A.D. 33). Called the Elder, she was a daughter of Marcus Vipsanius Agrippa and Julia, daughter of Augustus. A woman of strong character, she shared the hardships of the campaigns of her husband Germanicus, by whom she was the mother of Caligula and Agrippina, mother of Nero. Her popularity is said to have aroused the jealousy of Tiberius, and she was banished to the island of Pandataria, where she died.

Agrippina (c. A.D. 15-59). Called the Younger, she was a daughter of Germanicus by Agrippina the Elder. Her first husband was Gnaeus Domitius Ahenobarbus, by whom she had a son, afterwards the emperor Nero. Later she married her uncle the emperor Claudius and persuaded him to adopt her son, to the detriment of Britannicus, his own son by his former wife Messalina. When Claudius died in 54, it was said he was poisoned by Agrippina. Nero, on his accession, had her assassinated. Agrippina wrote *Memoirs* (*Commentarii*), now lost.

Agronomy (Gr. *agros*, field; *nemein*, to manage). Term applied to that part of agriculture which is concerned with crops. A fully equipped agricultural depart-

ment in a university, or even a farm institute, should employ at least one specialist who is an agronomist.

Aguada. Town on W. coast of Puerto Rico, West Indies, 12 m. N. of Mayaguez. Here Columbus is said to have landed in 1493.

Agua Dulce. City and seaport of Panama. It is situated on the N. shore of Parita Bay, a W. arm of the Gulf of Panama, and is a flourishing commercial city, with sugar and rum distilling industries. Salt is worked.

Aguarico. River of Ecuador. Rising in the Andes, it flows S.E. for 250 m. to join the Napo.

Aguascalientes (Span. warm waters). One of the states of Mexico. Centrally situated on the Mexican plateau, it is named after its warm springs. Cereals, legumes, etc., are grown, stock is reared, and lithographic and building stone, copper, lead, iron, silver, and gold are found. It is well watered, salubrious, and has good rly. communications. Area 2,499 sq. m. Pop. 160,282.

Aguascalientes. Capital of Aguascalientes State, Mexico. It is 365 m. by rly. N.W. of Mexico city and has rly. connexion also with Tampico and the U.S.A. About 6,400 ft. above sea level, it has numerous fruit gardens, cotton and woollen factories and smelting works, manufactures pottery and tobacco, and exports bullion and hides. Pop. 81,124. There is a town of the same name in Peru.

Ague (Lat. *acutus*, acute). Name for acute fevers or affections occurring in paroxysms, such as malaria (*q.v.*); others are Aden ague and brow and face ague. See Dengue; Tic Douloureux.

Aguecheek, SIR ANDREW. A comic character in Shakespeare's *Twelfth Night* (*q.v.*). He is the boon companion of Sir Toby Belch.

Aguesseau, HENRI FRANÇOIS D' (1668-1751). French lawyer. Born at Limoges, he became advocate-general in 1690, procurator-general in 1700, and chancellor in 1717, an office he retained, save for two brief periods, until 1750. He died Feb. 9, 1751. A brilliant orator, he did much to reform the administration of justice.

Aguilar, GRACE (1816-47). English authoress. Daughter of a Jewish merchant, she was born in London June 2, 1816, and lived mostly in Devon. She wrote in defence of the Jewish faith, but is chiefly noted for her novels, *e.g.* *Home Influence*, 1847, and *The Vale of Cedars*, 1850. These dealt sentimentally with domestic life, reflecting a strongly religious temperament. She died while visiting Frankfurt, Sept. 16, 1847. *Pron.* A-ghée-lár.

Aguilas. Seaport and watering-place of Spain, in Murcia province. On the Mediterranean, 40 m. S.W. from Cartagena, it is a rly. terminus, exports iron ore and other minerals, and is the chief outlet for esparto. Pop. 17,000.

Agrippina the Elder. This beautiful example of ancient sculpture has long been traditionally believed to represent the mother of Caligula and grandmother of Nero
Capitoline Museum, Rome

Aguinaldo, EMILIO (b. 1870). Filipino patriot. Born at Cavite, Luzon, of which he was mayor

Emilio Aguinaldo,
Filipino patriot

1893-6, he took a leading part in the insurrection against Spain. In the Spanish-American War he first supported the American forces, but in 1899 led a formidable rising against them. Captured in March, 1901, a month later he formally swore allegiance to the U.S.A. and retired into private life, from which he emerged only for a brief period in 1935, when he stood unsuccessfully as candidate for the presidency of the Philippine Commonwealth.

Aguirre, LOPE DE (1508-61). Spanish pirate. In 1559, after a seafaring life, he joined de Ursua's expedition to the upper Amazon in search of El Dorado. He abetted Guzman in the mutiny in which de Ursua and his lieutenant were killed, and after his own faction was established he contrived the murder of Guzman. An amazing voyage followed, in which the self-proclaimed rebels sailed down the river, looting, murdering, and burning everywhere. They captured Margarita island, killing the governor and robbing the royal treasury. From here Aguirre wrote a letter to the king of Spain accusing him of ingratitude, but soon afterwards was shot by his fellow rebels, Oct., 1561. Southey describes his piracy in *The Expedition of Ursua* and the *Crimes of Aguirre*, 1821. *Pron. Ag-irray*.

Agulhas (Port., needles). Cape of Africa. The southernmost point of the continent, it derives its name from its jagged rocks, and is subject to violent storms. Agulhas Bank extends E. from the cape along the entire coast of South Africa.

Ahab. King of Israel (875-83 B.C.). He succeeded his father Omri (1 Kings 16-22), and by his marriage with Jezebel, daughter of Ethbaal, king of Tyre, was drawn to the worship of Baal and Astarte. When, to secure Naboth's vineyard for him, Jezebel caused Naboth's death, and Ahab hastened to take possession of the land he coveted, he was met by Elijah with the prophecy of his death and the destruction of his house, a punishment delayed by his repentance. In his reign of

22 years he carried on two successful campaigns against the Syrians under Benhadad II, and was slain in a third campaign at Ramoth-gilead by a "certain man" who "drew a bow at a venture." Ahab is the name also of a false prophet burnt to death by Nebuchadrezzar (Jer. 29).

Ahasuerus (c. 519-c. 465 B.C.). King of Persia. He is mentioned in Ezra 4, Dan. 9, and Esther, and is usually identified with Xerxes, son of Darius Hystaspes, but doubt has been thrown on the identity of the Ahasuerus of Dan. 9, since Darius the Mede is unknown to history. Ahasuerus is also the name of the principal character in the legend of the Wandering Jew.

Ahaz. Son and successor of Jotham, king of Judah (2 Kings 16; 2 Chron. 28; Is. 7). He became a vassal of Tiglath-Pileser, king of Assyria, whose aid he had sought against the kings of Israel and Damascus. He reigned for 20 years, about 735-15 B.C.

Ahaziah. Name of two kings mentioned in the O.T. One was son and successor of Ahab, king of Israel (1 Kings 22; 2 Kings 1). He was a worshipper of Baal, and reigned c. 851-49 B.C. The other was son and successor of Jehoram, king of Judah, and of Athaliah, daughter of Ahab (2 Kings 8; 2 Chron. 22), and was slain by Jehu after a year's reign c. 844-3 B.C.

Ahimelech. High priest at Nob (1 Sam. 21-22). For giving David the shew-bread to eat and the sword of Goliath, he and his house were slain by Saul. Another Ahimelech was a Hittite companion of David (1 Sam. 26).

Ahithophel. Friend and counsellor of David (2 Sam. 15-17). He joined Absalom in rebellion, but despairing of success, he "put his household in order and hanged himself."

Ahmad (1898-1930). Shah of Persia 1909-25, last of the Kajar dynasty. Born Jan. 20, 1898, Ahmad became shah when his father, Muhammad Ali, abdicated July 16, 1909, the country being governed by a regent. On July 21, 1914, he was crowned. He remained at Teheran during the First Great War, refusing to be

drawn into hostility to the Allies. Never popular with his subjects, he was deposed in 1925, when Riza Khan became shah. Ahmad died in Paris, Feb. 28, 1930. *See Persia.*

Ahmadabad. Chief city of Ahmadabad district, prov. of Bombay, India. On the Sabarmati river, 309 m. by rly. N. from Bombay, it is an important centre of the cotton industry, and also manufactures gold, silver, and silk thread, pottery, paper, and tin. A walled city, 2 sq. m. in area, it has some fine mosques, the architecture of which often displays a striking blend of Mahomedan and Hindu or Jain styles. Typical examples are the Jama Masjid or Great Mosque, with its decorated minarets, the Ivory Mosque, a marble building lined with ivory and inlaid with gems, and the Jain temple of Hathi Singh.

Ahmadabad. The Jama Masjid, or Great Mosque, a striking example of the blending of Mahomedan and Hindu architecture

Founded in 1412, it was a city of great splendour under the Mogul emperors and capital of the Mahomedan kingdom of Gujarat. Captured by the British in 1780, it was restored to the Mahrattas, but reverted to Great Britain in 1818. Disturbances occurred here in April, 1919, when two government buildings were burned.

The district has an area of 3,815 sq. m. and produces cotton. Pop. of city, 591,267.

Ahmadnagar. Chief town of Ahmadnagar district, prov. of Bombay, India. On the Sina river, it is 218 m. E. of Bombay by the Great Indian Peninsula Rly. A walled city, founded in 1494 and 3 sq. m. in area, it was captured in 1803 by General Wellesley (later the great duke of Wellington). Its manufactures include cotton and silken goods, copper and brass pots. Ahmadnagar Fort, used during the South African War for the internment of Boer prisoners and during the First Great War for that of Germans, lies $\frac{1}{2}$ m. to the E. Pop. 49,878. The district of Ahmad-

nagar, with an area of 6,600 sq. m., is chiefly agricultural and produces pulse, millet, oil-seeds, etc.

Ahmed (1724-73). Ameer of Afghanistan 1747-73. The son of Sammaun, or Seman, Khan, chief of the Abdali tribe, he served in the bodyguard of Nadir Shah. When, in 1747, Nadir was assassinated, Ahmed was acclaimed ruler; he then changed the name of his tribe to Durrani and founded the dynasty of that name. His wealth, which included the Koh-i-nur diamond, and his military talents helped him to popularity, and he made extensive conquests. He captured Lahore in 1748, mastered the Punjab in 1751, conquered Kashmir, and sacked Delhi, but had to yield the Punjab to the Mahrattas and Sikhs.

Ahmed I (1589-1617). Sultan of Turkey. The elder son of Mahommed III, he became sultan in 1603. He carried on unsuccessful wars with Austria and Persia, that against Austria being terminated in 1606 by the peace of Sitvatorok, said to be the first occasion on which the Turks observed the principles of international law in their intercourse with a Christian nation. According to Turkish writers, tobacco was first used in Turkey in his reign.

Ahmed II (1643-95). Sultan of Turkey. He was a brother of Suleiman II, whom he succeeded in 1691. The chief event of his reign was the defeat of the Turks by the Austrians, Aug. 18, 1691, at Slankamen.

Ahmed III (1673-1736). Sultan of Turkey. Brother of Mustapha II, on whose deposition he succeeded in 1703, he was the first sultan to announce his accession to the European sovereigns. In 1709 Charles XII of Sweden, defeated by Russia at Poltava, took refuge in Turkey, and this led to war with Russia in 1710. The war ended a year later, and by the treaty of the Pruth Russia ceded Azov. In 1715 the Morea was seized from the Venetians, but the Turks were defeated by the Austrians at Peterwardein in 1716 and at Belgrade in 1717, peace being concluded with Austria at Passarowitz in 1718. Ahmed was deposed in Sept., 1730, and was kept in prison until his death.

Ahmed Vefik (1819-91). Turkish statesman. Educated in Paris, he was ambassador in Persia 1851-5. In 1860 he went as ambassador to Paris, but was recalled in 1861. From 1879 to 82 he was vali of Broussa (Bursa), in Asia Minor, and his administra-

tion was eminently beneficial. He was twice prime minister of Turkey, and laboured to promote education. A French scholar, he translated Molière into Turkish.

Ahobalam. Village of Madras, India, in Kurnool district. On a neighbouring hill are three pagodas of great local sanctity. One temple contains on its walls, and also on its two great stone porches, which are supported on rock-hewn pillars, beautiful reliefs of scenes from the Mahabharata.

Ahom. Hinduised tribe of Tai origin living in the Brahmaputra valley, Assam. Their native chronicles record their crossing the Patkai Pass in A.D. 1228 into the land named after them Assam. Overthrowing the medieval Chutiya and Koch kingdoms, their domination, culminating in 1700, declined until the British subjugation in 1826. Their Tai speech is all but lost; matriarchy and other primitive customs survive.

Ahriman. Personification of the spirit of evil in the Zoroastrian belief of the ancient Persians and the modern Parsees. Like the Satan of the Bible, he is the chief of a hierarchy of demons of darkness, but, unlike Satan, is regarded as the equal of the creator Ormuzd, orOrmazd, the spirit of good, although before the end of the world he is to be finally subdued. Other forms of the name are Angra Mainyu and Arimanes. See Zoroastrianism.

Ahwaz, AHWAS OR AHWUZ. Town of Persia, in Khuzistan district. It stands on the river Karun, 70 m. N.E. of Basra, and is notable for the neighbouring ruins of the capital of Artabanus, the last king of Parthia. In the war with Persia, 1857, it was captured by the British. During the First Great War the British occupied Ahwaz in order to protect the oil wells of the Anglo-Persian Oil Company. It was again occupied by a British force in Aug., 1941, when armed intervention by British and Russian troops removed the danger of Nazi control in Persia. Ahwaz was subsequently used as an important clearing-station for British and American war supplies on the way to Russia. A new rly. to Ahwaz from Khorramshahr (near Basra) was constructed for the purpose. Pop. 30,000.

Ai OR HAI. Royal city of the Canaanites, E. of Bethel (Gen. 13; Josh. 7-8). The Israelites were smitten here after the fall of Jericho. With its inhabitants it was utterly destroyed by Joshua.

Aicard, JEAN FRANÇOIS VICTOR (1848-1921). French poet. Born at Toulon, Feb. 7, 1848, he achieved recognition with *Les Rébellions et les Apaisements* (1871). Other works include *Miette et Noré* (1880) and *Jésus* (1896). He also wrote plays and novels. He died May 13, 1921.

Aichi. Japanese aircraft-manufacturing concern which built dive-bombers used in the Second Great War.

Aich's Metal. A brass alloy of the same group as Muntz metal (*q.v.*), containing 60 per cent copper, 38.5 per cent zinc, and 1.5 per cent tin or iron.

Aida. An opera by Giuseppe Verdi (*q.v.*). It was written to the commission of the Egyptian government for the opening of the Cairo opera house and first performed there in Dec., 1871. The setting is ancient Egypt, and the libretto, by Ghislanzoni, was based on a theme suggested by Mariette Bey, the French Egyptologist. The music, rich and dramatic, belongs to the composer's middle period. In Feb., 1872, Verdi conducted the first Italian performance at La Scala, Milan. The opera was first performed at Covent Garden June 22, 1876.

Aidan (d. 651). Saint and Apostle of North Britain. He was a monk of Iona and was sent to Northumbria at King Oswald's request. There he won the people to Christianity, and was consecrated first bishop of Lindisfarne in 635. He made this place the centre of his missionary work, and when Oswald died his successor Oswy protected him. He died at Bamborough, Aug. 31, 651.

Aide-de-camp. Word, of French origin, applied to an officer who serves a general or a governor in a personal capacity. In times of peace his functions are secretarial and domestic. In war he arranges for the comfort of the commander, and sometimes acts as camp commandant at headquarters, supervising the batmen, drivers, clerks, etc. In Great Britain certain colonels are appointed as aides-de-camp to the King, an honorary distinction in most cases. An aide-de-camp is designated by the letters A.D.C.

Aidin OR GÜZEL-HISSAR. Town of Turkey, in the vilayet of Aidin. It stands 81 m. by rly. S.E. of Izmir. Built near the ruins of ancient Tralles, it makes leather and is noted for its sweetmeats, olive oil, fruit, and cotton. It suffered by an earthquake in 1899. Pop. of the vilayet, 281,784; town, 70,000.

Aiding and Abetting. In law, the act of encouraging anyone to commit a crime by expressions, gestures, or actions intended to signify approval. A great authority, Mr. Justice Hawkins, laid it down that mere passivity cannot be aiding and abetting. "It is no criminal offence," he said, "to stand by, a mere passive spectator of a crime, even of a murder. Non-interference to prevent a crime is not itself a crime." Aiding and abetting is a crime varying in degree of penalty with the crime that is aided and abetted. It is a contempt of court to aid and abet a contempt of court. Thus, when a sheriff's officer, in the execution of his duty, is assaulted, and someone standing by cheers on the assaulter, both the aggressor and the encourager are "in contempt."

Aids. Payments made in feudal times by vassals to the king, barons, and other overlords, the equivalent of the taxes of to-day. The Latin word for aid in this sense was *auxilium*, help.

At first in England the kings and barons collected aids as often as they could, but by the time of Henry I the number of times they could lawfully do this had been reduced to three: (1) when the eldest son was knighted; (2) when the eldest daughter was married; (3) when the king or lord himself needed ransom. These were the regular feudal aids. But the kings did not confine themselves to three aids, hence in Magna Carta King John was forbidden to collect any except the regular aids, unless with the consent of the council. In 1275 the amount of a feudal aid was fixed at 20s. for each knight's fee, and from time to time these were collected until the reign of James I, who took the last on record in 1613. The term aid was also used

in the time of the later Plantagenet kings (1272-1377) for other taxes—for the tax paid to the king by the towns, for money paid in lieu of military service, and for that paid to sheriffs for their own use. See Taxation.

Aigburth. Southern residential suburb of Liverpool, England. Its railway station is called Mersey Road and Aigburth. One of the Lancashire county cricket grounds is here. Sefton Park lies to the north. See Liverpool.

Aigrette. French name for the egret, the smaller white heron with a tufted head plume. In England the word was used for the plume once fashionable in millinery, also called osprey (*q.v.*). The plucking of the plumes involves the death of the bird during the nesting season, and importation into the U.K. is now illegal.

Aiguebelle. Village of France, in the department of Savoie. Situated 15 m. by rly. E. of Chambéry, and near the beginning

Aigrette, or egret, the small white heron with tufted head plume

connected by canal. Louis IX embarked here in 1248 and 1270 for the Crusades. Its well-preserved walls and towers were built about 1280. It carries on trade in coal, fruits, wine, and fish, and makes soda. Pop. 4,330.

Aigues-Mortes. Famous fortifications of the old French town of that name in the department of Gard. They were built about 1280

of the Mt. Cenis road, it was the scene of a defeat, in 1742, by French and Spanish of Sardinian forces.

Aigues-Mortes (Lat. *aguae mortuae*, dead waters). Old fortified town of France, in the department of Gard. It is 24 m. by rly. S.S.W. of Nîmes, and 3 m. from the Mediterranean, with which it is

Aiguille (Fr. needle). Name for a bare needle-shaped pinnacle of rock standing above the snow-line. Such pinnacles are formed by the action of frost causing granite or other crystalline rocks to split along joints or planes of cleavage. The use of the word is almost confined to the Alps.

Aiguillettes or **AIGLETS** (Fr. *aiguille*, needle). Metal tags or points sheathing the ends of ties, prevalent chiefly in the dress of the 16th and 17th centuries. These ties were used in great profusion as ornaments and as substitutes for buttons when passed through eyelet holes. Apparently in the time of Shakespeare aiglets, as they were then called, often consisted of little figures of gold or silver. Survivals are to be seen on the shoulders of naval and military uniforms.

Aiguille Verte. Mountain of France. E. of Chamonix, it is a peak of the Mont Blanc chain, 13,540 ft. high, first ascended by Edward Whymper (*q.v.*) in 1865.

Aiguille Verte. Peak in France, belonging to the Mont Blanc chain. It is the highest point to the left, and is 13,540 feet high

Aigun OR SAKHALIN ULA. Town of Manchuria. On the right bank of the Amur river, it is 18 m. S. of Blagoveshtchensk. It trades in grain, tobacco, and mustard. Here was concluded, May, 1857, a treaty whereby China ceded to Russia the left bank of the Amur. Pop. 38,112.

Aikawa. Town on the W. coast of Sado Island, Japan. It is 40 m. W.N.W. of Niigata, and to the N.E. is the famous Sado gold mine, discovered in 1601. Silver is also worked, and the town has ore reduction works.

Aiken, CONRAD POTTER (b. 1889). American poet. Born at Savannah, Ga., August 5, 1889, he graduated at Harvard in 1911. His first book of poetry, *Earth Triumphant and Other Tales*, appeared in 1914; and it was followed by many other volumes of verse and literary criticism, as well as a novel and short stories. From 1917 to 1919 he contributed to *Dial*, and in 1930 he was awarded the Pulitzer prize for the best volume of verse.

Aiken, FRANK (b. 1898). Irish politician, born Feb. 13, 1898. Active in the Irish Volunteers, 1914, he commanded the northern division of the I.R.A. in 1921, and was I.R.A. chief of staff 1923-25. He played a part in the negotiations resulting in the establishment of the Free State in 1922. Member of the Dáil for Louth from 1923, he was minister for defence, 1932-39, for coordination of defence, 1939-45, and for finance, 1945-48.

Aikenhead, MARY (1787-1858). Irish philanthropist. Born Jan. 19, 1787, eldest daughter of a Protestant doctor of Cork, she became a Roman Catholic when in her teens and entered a convent at York. Returning to Dublin, she founded the Congregation of the Irish Sisters of Charity, the first of its kind in Ireland, and was appointed its supreme general. Although almost bedridden for many years, she eventually superintended eight convents, an asylum for penitents, and a hospital in Dublin, the first hospital in Ireland to be served by nuns. She died July 22, 1858.

Aikenhead, THOMAS (c. 1678-97). Scotsman hanged for blasphemy. Born in Edinburgh, the son of an apothecary, he was accused of expressing contempt for the Scriptures and theology generally. He recanted, but being tried under a statute declaring blaspheming of any Person of the Trinity punishable by death, was hanged at Edinburgh, Jan. 8,

1697, after declaring full adherence to the Christian faith. *Consult* State Trials, XIII.

Aikin, JOHN (1747-1822). English author. Born at Kibworth-Harcourt, Jan. 15, 1747, he qualified as a physician, and from 1792 practised in London. A friend of Southey and Priestley, he produced in collaboration with his sister, Anna G. Barbauld, several popular books, including *Evenings at Home*, 1795. He also wrote a number of biographies. He died Dec. 7, 1822.

Ailantus OR TREE OF HEAVEN. The tree is a native of North China, whence it was introduced

the right aileron is moved downwards. The result is that the "angle of attack" to the airflow over the wings is reduced on the left and increased on the right. It follows that the left wing loses some of its lift and drops while the right wing rises as its lift is increased. The opposite effects are produced when the control column (or wheel) is moved to the right: the left aileron is then pulled down and the right aileron is moved up. Movement of the aircraft brought about by actuation of the ailerons is in that which is called the rolling plane. The other control surfaces

Ailsa Craig. Basaltic rocky islet in the Firth of Clyde, Scotland. It rises 1,140 ft. above the sea level. See p. 136

to Europe in 1751. In some places it is extensively planted as a shade tree. Its compound leaves are from 2 ft. to 6 ft. long, and may be mistaken for leafy branches. The flowers are small, greenish-white, and evil-smelling. The botanical name is *Ailantus* or *Ailanthus glandulosa*, and it belongs to the family Simarubaceae. The larva of the *Ailanthus* silk-moth feeds on the plant.

Aileron (French, wing tip). The hinged surface fixed to the trailing edge of aircraft wings to provide lateral control. Fitted near the wing tips, the ailerons are interconnected, usually by cables, and are moved by means of the control column ("joystick") in the pilot's cockpit. When the column is drawn to the left, the left aileron is moved upwards and

of a machine are the elevator and the rudder. The former gives control in the pitching plane and the latter in the yawing plane. See *Aeroplane*.

Ailesbury, MARQUESS OF. British title borne since 1821 by the family of Brudenell-Bruce. The family is descended from Thomas Brudenell, a younger son of the earl of Cardigan, who was made earl of Ailesbury in 1776. He was a nephew of Charles Bruce, 4th earl of Elgin, who made him his heir; hence the name of Brudenell-Bruce. The 2nd earl was created a marquess, and in 1868 the 2nd marquess inherited the title of earl of Cardigan, since used for the heir to the marquessate. The 6th marquess (b. 1873) succeeded his father in 1911. Savernake Forest, in Wiltshire, is the property of the family.

Ailette. River of France, in the department of Aisne. A left-bank tributary of the Oise, it was the scene of much fighting during the First Great War.

Ailly, PIERRE D' (1350-1419). French theologian and philosopher. Born at Compiègne, he became chancellor of Paris University in 1389, bishop of Cambrai in 1396, and cardinal in 1411.

Aileron. Hinged surface fitted to the rear edge of an aircraft wing in order to provide lateral control

Known as the Hammer of Heretics, he presided as papal legate at the council of Constance. From one of his works, *Imago Mundi*, Columbus was inspired to seek a western passage to Asia. As a philosopher, he was a nominalist.

Ailsa, MARQUESS OF. Scottish title dating from 1831 and borne by the family of Kennedy. The first Lord Kennedy, Gilbert, ennobled 1452, was one of the regents of Scotland during the minority of James III. The 3rd lord, made earl of Cassilis in 1509, was killed at Flodden in 1513; the 3rd earl was poisoned in France while arranging the marriage between Mary Queen of Scots and the Dauphin. The 12th earl was made marquess of Ailsa. The 5th marquess was born in 1875 and succeeded his brother in 1943. The family seat is Culzean Castle, Ayrshire, and the eldest son is known as the earl of Cassilis.

Ailsa Craig. Rocky islet in the Firth of Clyde, Scotland, 10 m. W. of Girvan. Rising 1,140 ft., it is composed largely of a form of columnar basalt which affords material for curling-stones. The island has a lighthouse, built in 1836. See illustration, page 185.

Aimak. Semi-nomad tribal group in the N.W. highlands of Afghanistan. Of Mongol stock, tracing descent from the Tartar hordes which overthrew the Caliphate in the 13th century, they speak a Persianized dialect.

Aimard, GUSTAVE (1818-83). French novelist, whose real name was Olivier Gloux. He shipped to America as a cabin-boy, and there passed ten years among the Red Indians, afterwards seeking adventure in Spain and Turkey. In 1848 he returned to Paris and served as an officer in the Garde Mobile, and in 1870 he organized and commanded the francs-tireurs of the press. He died in Paris, June 20, 1883. His adventure stories resemble those of James Fenimore Cooper (*q.v.*), and many of them have been translated into English.

Ain. River of France. Rising in the Jura Mts., near Nozeroy, it flows 119 m. W. and S. to join the Rhône 18 m. above Lyons.

Ain. Department of E. France. Between the Rhône and Saône rivers, and bordered N.E. by the Swiss cantons of Vaud and Geneva, it has an area of 2,248 sq. m. and is traversed by the river Ain. A centre of pastoral and agricultural activity, it yields bituminous limestone, from which Seyssel asphalt is made. The

chief towns are Bourg, the capital, and Belley. Pop. 316,710.

Ainger, ALFRED (1837-1904). British divine and man of letters.

Alfred Ainger
Elliott & Fry

Born in London, Feb. 9, 1837, he was educated at King's College, London, and Trinity Hall, Cambridge. Ordained in 1860, in 1865 he became reader at the Temple Church, and in 1887 canon of Bristol. In 1894 he was chosen master of the Temple. He is chiefly known as the biographer and editor of Charles Lamb, and his friends included Charles Dickens, Leslie Stephen, and Tennyson. He died Feb. 8, 1904, at Darley Abbey, near Derby.

Ainley, HENRY HINCHLIFFE (1879-1945). British actor. Born at Leeds, Aug. 21, 1879, he was a bank clerk before he went on the stage. After touring with Sir Frank Benson he made his first appearance in London at the Lyceum Theatre in 1900, and subsequently became one of the leading character actors on the British stage by his performances as Ilam Carve in *The Great Adventure* (1913) and Joseph Quinney in *Quinney's* (1915). In 1919 he became joint manager of the St. James's Theatre, London, and from 1920 to 32 appeared with conspicuous success in many of the leading plays of the day, notably in *Flecker's Hassan* (1923), *The First Mrs. Fraser* (1929-30) and *The Anatomist* (1931), and in many films. He was also distinguished in Shakespearean parts, among his finest interpretations being those of Mark Antony in *Julius Caesar*, and Hamlet. Owing to severe illness he left the stage for six years in 1932, but began broadcasting regularly in 1937. Radio proved an ideal medium for his exceptionally melodious speaking voice. He died Oct. 31, 1945.

Henry Ainley.
British actor

Ain Sefra. Territory and village of S. Algeria. The territory is traversed by the Saharan Atlas range. The village has rly. communication with Oman and other seaports on the N. coast. Pop. of territory 193,347.

Ainsworth, WILLIAM HARRISON (1805-82). British novelist. Born in Manchester, Feb. 4, 1805, the son of a solicitor, and educated at Manchester Grammar School, he was at first intended for his father's profession. He studied at the Inner Temple, but soon tired of the law and settled down in London as an historical novelist and magazine editor. His first success was *Rookwood*, 1834, and the last of his 39 novels, *Stanley Brereton*, was published in 1881.

W. Harrison Ainsworth
Portrait after D. Macise, R.A.

The Tower of London, 1840, *Old St. Paul's*, 1841, and *The Lancashire Witches*, 1848, are among his best works. From 1842-1853 he edited

Ainsworth's Magazine and for some years later *The New Monthly Magazine*. He died at Reigate, Jan. 3, 1882. See W. H. Ainsworth and his Friends, S. M. Ellis, 1911.

Aintree. Parish of Lancashire, England, a suburb of Liverpool, with a rly. station. The Leeds and Liverpool Canal passes across the racecourse, over which is decided annually (usually in March) the Grand National steeplechase.

Ainu or **AINO**. Primitive race of Caucasian stock inhabiting the Kurile Islands, Yezo and S. Sakhalen, but now rapidly dwindling towards extinction. Once occupying all Japan—and so recorded in native literature from 700 B.C. onwards—they appear to represent an early Caucasian stream, although when they reached Japan they encountered a still older aboriginal race of pit-dwellers and builders of kitchen-middens, wherein chipped stone implements and rude pottery have been found. Their name of the hairy Ainu is derived from their black wavy hair which is allowed to grow on head and chin, and involves the use of moustache-lifters (*ikubashi*).

Their primitive dress is a kimono-like robe of woven bark-cloth; their personal ornaments are largely of Japanese derivation. Occupying roomy reed-thatched huts, with separate storehouses on stilts, they are essentially hunters and fishers, using a detachable harpoon and cooking all animal food. Until recently their scanty cereal crops were reaped by mussel shells. Their

agglutinative language, clearly primitive, with no living analogies, is richly developed, a vocabulary of 14,000 words having been compiled. Their animism includes a complex nature-worship of the sun, fire, lightning, and rivers, and a system of magico-religious "message-bearers" loosely comparable with African fetishism. These are usually formed of wands hung with willow shavings, and set up at the east end of the living-room. Their ceremonial bear feasts are designed to offer divine honours to the victims, whose skulls are afterwards erected on village poles. Consult The Ainos D. MacRitchie, 1892; Alone with the Hairy Ainu, A. H. Savage Landor, 1893; The Ainu and their Folk-lore, J. Batchelor, 1901.

Air. As applied to the atmosphere we breathe the word denotes a mixture of gases surrounding the surface of the earth. Fresh country air consists of approximately 20.93 p.c. oxygen, 79.04 p.c. nitrogen. There is also present a small quantity of carbon dioxide which amounts to 0.03 p.c. in country air and approximately 0.04 p.c. in town air. A variable amount of water vapour is also present, the actual amount depending upon climatic conditions and on the locality. In addition there may be present in the air very small quantities of ammonia, sulphuretted hydrogen, sulphurous acid gas, and floating organic and inorganic matter, such as dust. See Atmosphere.

AIR AND PUBLIC HEALTH. An abundant supply of pure air is of the greatest importance in maintaining health. If the lungs are weakened by the effect of continually breathing impure air, they are apt to become the seat of tuberculosis or other disease.

Air may be vitiated or rendered unsuitable for breathing mainly by the following causes: (1) in rooms, by respiration and the burning of gas for heat or light; (2) in factories and workshops, by certain trade processes; (3) in towns, by smoke from chimneys and dust from streets.

AIR IN ROOMS. It was long believed that the injurious effects of ill-ventilated rooms were due to diminution of oxygen owing to its absorption in the process of breathing and the respiration of carbon dioxide gas. The air expired by human beings contains approximately 4.5 p.c. of carbon dioxide. In one hour an average man will exhale 0.6 cubic feet of carbon dioxide, so that in a closed

Ainu. Group consisting of an Ainu man with his son and four women. The women have tattooed marks round their mouths. Above, Ainu man and his wife

gas-tight compartment measuring $10 \times 10 \times 10$ ft. the air would be vitiated by one individual to the extent of 6 parts of carbon dioxide per 10,000 of air at the end of an hour. This led to the old-standing recommendation that the carbon dioxide in room air should not exceed 0.06 p.c.

It follows that if the carbon dioxide in the air of a room is kept down to this level there must be a good supply of fresh air ventilating the room. It must not be thought, however, that carbon dioxide itself is harmful in such small concentrations. In fact, it has been shown by Prof. Leonard Hill that a man can breathe 2 p.c. carbon dioxide in the air without experiencing discomfort. Usually, however, a high concentration of carbon dioxide in a room indicates stagnation of the air, which Prof. Hill showed to be the chief cause of discomfort experienced in a badly ventilated room. Satisfactory

air conditions in a room are not only a question of the purity of the air in respect of a low concentration of carbon dioxide. A human being is continually producing heat which must be lost to its surroundings if the body temperature is to be kept normal. Heat is lost by radiation to cool surroundings, by conduction (warming the air near the skin), and by evaporation of sweat. Hence the temperature, movement, and humidity of the air affect our bodies by virtue of their cooling effect.

AIR IN FACTORIES. Government regulations in regard to the purity of air in factories are strict. Pro-

vision must be arranged for securing and maintaining a suitable air temperature and effective ventilation. The air should be changed sufficiently often by the admittance of fresh air, impurities, unpleasant odours, and dust being intercepted. A satisfactory rate of air movement in the vicinity of a worker tends to ward off oppressive conditions and the relative humidity to create a feeling of comfort.

Special requirements apply to various types of manufacture. For example, all woodworking machines should be installed with mechanical exhaust fans, ducts, and hoods, by which sawdust and shavings are picked up at the machines and delivered at a point where they can be collected and used or destroyed. Grinding and polishing machines require to be treated in a similar manner so that dust is carried away from the worker and deposited in a settling

tank or receiver. Fumes from galvanising tanks, type-casting machines, and cellulose spray-painting also require to be exhausted by fans so that the workers shall not inhale dangerous particles or fumes.

AIR IN TOWNS. In industrial towns the air is most likely to be vitiated by solid particles, sulphurous acid and noxious gases contained in smoke from factories and private houses, and fumes from motor traffic. The regulations in regard to emission of smoke from factory chimneys are very definite, as shown by the following extracts from the Public Health (Smoke Abatement) Act:

"A chimney (not being the chimney of a private dwelling house) sending forth smoke in such quantities as to be a nuisance shall be deemed to be a nuisance liable to be dealt with summarily in manner provided by the Act, notwithstanding that the smoke is not black smoke . . .

"The expression 'smoke' shall include soot, ash, grit and gritty particles . . .

"The expression 'chimney' shall include structures and openings of any kind whatsoever capable of emitting smoke . . .

"Any local authority may, and if so required by the Minister of Health, shall, make by-laws regulating the emission of smoke of such colour, density or content as may be prescribed by the by-laws, and where such by-laws are in force the emission of smoke of the character so prescribed for such period as may be prescribed in the by-laws."

Contamination of the air by smoke has been considerably reduced by many factories now being provided with electric power for driving the machines, thus allowing the number of solid fuel burning boilers to be reduced. Smoke from private houses would be much reduced if central heating were adopted, as less fumes pass to the chimney through a well-designed hot water boiler using coke or anthracite as fuel.

L. J. Overton, M.I.H.V.E.

Air. In music this has several meanings, apart from the chief one of melody or tune. It means the highest or principal part in concerted music for voices or instruments; a simple song-like movement in a 17th or 18th century suite—which consisted otherwise mainly of dances—in which sense it is sometimes spelt *ayre*; and a similar movement in suites by Bach and his contemporaries of a

somewhat broader style and of weightier import.

Airacobra. A single-seat fighter aircraft manufactured by the Bell Aircraft Corporation of Buffalo, New York. Designated the P-39, this machine was of novel design. One of its most striking features was the position of the engine. This was mounted behind the pilot and drove the tractor airscrew by means of a shaft. A 37-mm. or 20-mm. shell-firing cannon was installed so that it could be fired through the airscrew hub, and machine-guns were mounted in the wings. It had a retractable tricycle undercarriage and stout armour plate was fitted around the cockpit. A low-wing monoplane, it had a wing span of 34 ft. and a length of 29 ft. 9 ins. Fully loaded it weighed 7,379 lb. The engine was a 1,150 h.p. liquid-cooled twelve-cylinder Allison. The prototype was built in 1939 and

ultimately a few machines were supplied to the Royal Air Force. The Airacobra was also used by the Red Air Force.

Airacomet. Name given to the P-59a fighter aircraft constructed by the Bell Aircraft Corporation of Buffalo, N.Y., U.S.A. It was the first reaction-propelled aircraft to be produced in the U.S.A. A mid-wing all-metal monoplane, it is powered with two gas turbine units manufactured by the General Electric Co. to the design of Air Commodore Frank Whittle, inventor of the jet-propulsion engine. The engines are installed in streamlined housings arranged below the wings and at their roots. The span is 48 ft., and the length 38 ft. 2 ins. The undercarriage is of the tricycle type and is retractable. Quickly outclassed by the Lockheed P-80 Shooting Star, the Airacomet was adapted and retained by the U.S.A.A.F. only as a fighter-trainer.

AIRBORNE FORCES AND OPERATIONS

MAJ.-GEN. R. N. GALE, C.B., D.S.O., O.B.E., M.C.

This article deals authoritatively and fully with the strategic and tactical uses of an essential feature of modern warfare, as developed during the Second Great War. See under Arnhem; Crete; D-day; Rhine; Rotterdam, etc., also under Parachute; Glider, etc.

The term airborne forces has by usage come to be applied to those forces which are transported by air to the battlefield. The term is thus not applicable to troops that are merely transported by air from one base of operations to another; nor is the term normally applied to those that are flown in to airfields as reinforcements. Airborne troops include parachute troops and airlanding troops. The former, as their name implies, land with all their equipment by parachute: the latter are landed normally in gliders, though they may be landed in aircraft if the terrain is suitable. The airlanding troops are more heavily equipped than the parachute troops, including in their armaments all types of anti-tank equipment, many types of vehicle, and light tanks.

Parachute troops have to be extremely fit and exceptionally self-reliant. The shock of landing is equivalent in effect to that of a free jump of 10 to 14 ft. or a rate of descent of approximately 20 m.p.h. However, because of special physical training and the development of a good technique, this produces an extremely small casualty rate. With winds of over 20 m.p.h. and on bad ground the casualty rate will obviously tend to increase. Parachute troops have to be prepared to act

quickly without previous reconnaissance, and on landing are often very scattered.

Glider-borne troops arrive in tactical sub-units, as each glider is designed to carry such units. The glider will carry heavy supporting arms and technical equipment and can land in comparatively high winds. They will land where there are no airfields and have often been successfully put down when it would be suicidal to land a powered aircraft.

The silent approach of a glider is one of its more important characteristics. The Germans exploited this in their assault on Fort Eben-Emael, Belgium, May 11 1940, and the British in their glider-borne *coup-de-main* parties in the assaults on the bridges over the Orne river on the night of June 5-6, 1944.

In this, however, as in any other operation of war, it is not in the copying of successful stratagems that success will lie, but in the learning of the lesson that surprise in method, in equipment, in tactics and in armament can teach; for surprise is the very essence of successful airborne attack.

Airborne forces are organized in divisions which, like normal infantry divisions, include a proportion of all arms. It thus follows that

they are capable, when on the ground, of playing their part as a normal division in battle. After landing, they may be supplied by air, either by parachute or by glider, or once they have linked up with the ground armies of their own side, they may be supplied over the ground. Airborne divisions may be grouped together as an airborne corps, and airborne corps may be grouped to form an airborne army.

The prerequisite for the employment of airborne forces is the possession of a reasonable degree of air superiority. In all forms of modern battle the first task that confronts the supreme commander in a theatre is to secure some degree of air superiority; without this no land battle can be won. Airborne forces are in this respect similar to the rest of the army; for against their extreme vulnerability while airborne it may well be possible to obtain a degree of local air superiority for a limited period of time.

The two principal adversaries confronting airborne troops are the enemy's fighter planes and his anti-aircraft fire. The night approach may defeat the day fighter, but leaves the column vulnerable to the night fighter, and technique in the development of defence against the night fighter is only in its infancy. Anti-aircraft fire can be doused by long-range artillery, by bombing, and by direct air attack. Bombing tends to crater ground on which it may be desired to land gliders. It also creates haze through which the landing of gliders may be so

hazardous as to preclude the use of the bomb weapon.

An airborne operation is, in fact, a combined operation of the first magnitude and is, so far as the airborne aspect of the plans is concerned, an air staff responsibility. This responsibility will include such action as the bombing of enemy airfields known to contain fighters which might interfere with the airborne convoy; the bombing and ground "strafing" of enemy anti-aircraft positions over the target areas; and the provision of a fighter escort during the approach. The army commander assumes control, of course, once the troops are landed.

The precise composition of the force to be employed, the order in which it is to land, and the precise areas where each unit is to be dropped are of vital importance to the army commander. All these matters will, however, have their reaction on the air plan. In this, as in a combined sea landing on the beaches, there must be a large measure of mutual understanding and give-and-take between the air and army commanders. It is noteworthy that in the Second Great War the commanding general of the 1st Allied airborne army was a U.S. Army Air Force officer, while his deputy was a British major-general.

The total number of aircraft required for a division is great, and the total number of troops and equipment to be lifted will often be in excess of the air lift. The assembly of a large airborne force in the battlefield will thus rarely be completed in one lift. In

planning for subsequent lifts the rate of enemy build-up *versus* the rate of airborne build-up will therefore determine the method by which the airborne troops can best be reinforced.

Airborne forces are mobile forces. They may be employed to seize ground vital to the advance of the main army; to secure ground as a pivot for manoeuvre; by direct assault, to overpower hostile defences; to complete annihilation of a defeated and retreating enemy; to seize airfields for the reception of ordinarily air-transported troops; or to disrupt enemy communications and cause confusion in his command by cutting telegraph lines and assaulting headquarters. They may, in fact, be used in mass for a major assault, as in the Rhine crossing, March, 1945, or in comparatively small parties as guerrillas behind the enemy lines.

Airborne forces can be landed either by day or by night. Modern scientific methods enable accurate flying to be carried out in conditions of darkness, and the development of the bomber technique for finding difficult targets can permit the dropping of parachute troops as accurately by night as by day. The Allied landing in Normandy in June, 1944, was carried out by night, the landings at Arnhem, Sept. 17, 1944, and in the Rhine crossing of March, 1945, were carried out by day. The Germans in Norway, Holland, and the Balkans used their airborne troops in the early hours of the morning. The British raid at Bruneval, Feb. 27-28, 1942, was carried out at night. The landings in Sicily, July 10, 1943, were carried out at night.

Another interesting element in this question of timing is: should the assault precede the main military operation or take place after this has opened? A blow delivered at an unexpected moment might well find an otherwise prepared enemy off his guard.

Airborne operations carried out during the war against Germany were remarkable for their diversity in conception and plan. The Germans in Norway in April, 1940, used one company of their 1st parachute regiment at Dombas to seize the railway station and close the road to the British. Casualties were heavy, but the experience undoubtedly helped the Germans in their later employment of this arm. In Holland in May, 1940, the Germans used it to capture the bridges of the

Airborne Forces. U.S. army parachutists jumping from a low altitude under cover of a smoke screen laid by bombers, during operations against the Japanese occupying New Guinea in 1942

Rhine and Maas and to seize the aerodrome at Rotterdam. This plan was put into execution with great skill, the airfield being seized by the early morning of May 10, 1940. A considerable number of troops were landed during the ensuing days. At Fort Eben-Emael the Germans carried out their first glider-borne operation. Here gliders were actually landed on the super-structure of the fort, and later the German troop carriers arrived and dropped their parachute troops. It is difficult to assess what a direct assault by ordinary ground troops on this fort might have cost the Germans: it certainly could not have been seized more economically.

The German landings on Crete in May, 1941, were carried out on a mass scale against little or no serious opposition. Here the plan was to use parachute troops to disorganize communications and interfere with the machinery of the British command, as well as to seize airfields on which troop-carrier aircraft were to land. The British possessed scarcely any anti-aircraft defences, and fighter cover was almost non-existent. So disproportionate were the strengths of the two sides that little can be learned from this operation.

Between this enterprise and the Allied use of airborne forces the balance of air power swung from the Germans to the Allies. British operations developed from the successful raid on Bruneval in 1942 by a company of parachutists, to the mass landings of

the Allies over the Rhine in March, 1945. They were used with success, but not on a large scale, in the landings on Sicily and again in the battle for the Anzio beach-head, Jan. 22, 1944; but it was not until the invasion of Normandy that really large-scale operations were undertaken. Here the British 6th division landed before the seaborne assault on the night of June 5-6. They secured high ground east of the river Orne, and held this ground, which was a pivot of the British 2nd army manoeuvre, for as long as three months; and finally drove the Germans back to the Somme.

Arnhem, the most spectacular and ambitious operation, was carried out by an airborne corps under Lieut.-Gen. F. A. M. Browning. They seized bridges at Eindhoven, Nijmegen, and Arnhem, laying as it were a carpet some 60 m. long down which the British 2nd army advanced. The heroism of these troops at Arnhem in the gallant part they played, and the failure of the 2nd army to make contact over the last river, has sometimes obscured the success of the remainder of this great operation; for it was the action of the airborne troops at Eindhoven and Nijmegen which facilitated and, indeed, made possible the advance of the 2nd army from the Belgian frontier to the very outskirts of Arnhem itself.

Airborne divisions did not confine themselves to airborne operations. The 6th British airborne division was reported as fighting

from D-day to the end of the war with Germany. The U.S. 101st airborne division won undying fame in the Bastogne battle in Jan., 1945.

The German parachute divisions, as they were called, fought continuously in the line. The last action in which they were used as airborne troops was in Rundstedt's offensive in the Ardennes in the winter of 1944-45. Here the German hand seemed to have lost its cunning, for these ventures achieved little or no success.

Air Chief Marshal. Title held by an officer in the R.A.F. It is the second highest in the service, the highest being Marshal of the Royal Air Force. It corresponds to admiral in the Navy and general in the Army. The rank is indicated when service dress uniform is worn by one broad ring of braid with three narrow braid rings on the sleeves of the tunic and on the shoulder straps of the great-coat. This rank with others was instituted in Aug., 1919, sixteen months after the Royal Naval Air Service and the Royal Flying Corps were merged to form the Royal Air Force.

Air Commodore. Title of an officer of the Royal Air Force which is equivalent to that of Commodore, 2nd Class, in the Royal Navy and Brigadier in the Army. The rank is indicated by a broad ring of braid on the tunic sleeves and shoulder straps. Before it was instituted in Aug., 1919, officers who had reached such status in the Royal Air Force

which was formed in April, 1918, carried either the naval or military titles according to whether they had served previously in the Royal Naval Air Service or the Royal Flying Corps. The W.R.A.F. equivalent is air commandant.

Air Conditioning. System by which the air in a room or building is rendered and maintained in perfect condition suitable for the comfort and health of persons in occupation. It also applies to obtaining the exact temperature and relative humidity of the air required in a room or factory when special materials are in the process of manufacture or kept in storage. For cinemas, theatres, and public halls air conditioning plants are in some districts compulsory, and many hotels provide this method of warming or cooling and ventilating in their principal rooms. Rly. coaches in the U.S.A. and elsewhere are also air conditioned.

An air conditioning plant provides that the incoming fresh air is cleansed, warmed or cooled to a definite temperature, humidified or dehumidified, and, if required, treated chemically to disinfect or deodorise. Complete air conditioning should control simultaneously temperature, humidity, volume, air movement, air distribution, and the elimination of dust, bacteria, odours, and toxic gases. Taking, for example, a suitable air conditioning plant for a cinema, a centrifugal fan capable of delivering 1,000 cubic feet of fresh air per hour per person (according to seating accommodation) discharges conditioned air through sheet metal or built ducts into the building. The fresh air is drawn from outside the building, and passes through a filter consisting of perforated metal trays coated with viscous oil. These trays are easily cleaned when dust accumulates on them. The air then passes through the air conditioning chamber, which is built of light metal sheets, enclosing steam or hot water batteries of special radiators or gilled pipes for warming the air, and water sprays for washing or cooling and humidifying, while for special cooling a refrigerating coil may be incorporated in the conditioning chamber. Automatic controls may be provided to regulate the temperature of the air delivered and the relative humidity, also to regulate the supply of steam or temperature of the water in the heater batteries. Extract ventilation at about 75 per cent of the volume

of air delivered may be used in conjunction with the air conditioning plant.

A small all-electric air conditioning unit is obtainable for use in single rooms. Contained in a neat casing are a motor-driven fan, a box filter, an electric heating element, a water tank with electric immersion heater to humidify the air, and a compressor refrigeration plant for cooling.

L. J. Overton

Air Council. The controlling authority of the Air Ministry. The Council supervises all matters relating to the Royal Air Force and the defence of the realm by the exercise of the country's air power. The president is the secretary of state for Air; the vice-president is the parliamentary under-secretary of state for Air; the remainder of the Council consists of nine service officers; the chief of air staff, the vice-chief of air staff, the air member for per-

sonnel, the air member for supply and organization, the air member for training, the air member for technical survey, two additional members, and the permanent under-secretary of state for Air.

Aircraft. Comprehensive term applied to every type of flying machine. In modern times it is normally employed to describe a power-driven, pilot-controlled, heavier-than-air machine, i.e. an aeroplane, but it is applicable to airship, balloon, glider, or helicopter. When the Germans introduced their flying bomb in the Second Great War this projectile was designated by the British Air Ministry the "pilotless aircraft," and later classified as a "guided missile." The later V2 was rocket-propelled, in a sub-division (as are jet-propelled aircraft) of the reaction-propulsion class. See the table below: also under Aeroplane; Airship; Flying Bomb; Glider etc.

AIRCRAFT CARRIER: TYPES AND USES

Capt. Norman Macmillan, M.C., A.F.C.

This article deals with developments in the design of aircraft carriers 1917-45, with their strategical and tactical deployment in war, and explains fully how carrier-borne aircraft are operated from the parent vessel. See also Fleet Air Arm

In the earliest days of naval flying, officer pilots of the Naval Wing, Royal Flying Corps, the forerunner of the Royal Naval Air Service, realized that their *métier* was air-cooperation with ships; and almost as soon as they had learned to fly, they sought means to use their aeroplanes from ships. Their experimentation took two lines: (1) development of seaplanes that could be flown from water, and hoisted outboard and inboard by parent ships called seaplane carriers; (2) flying landplanes from ships. It was the continuation of the second line of experimentation that brought about the aircraft carrier, a type of ship pioneered by the Royal Navy.

EARLY HISTORY. In 1911 Lt. C. R. Samson (one of the first four naval pilots) designed and had built in Chatham dockyard a double trackway for aeroplanes. It was erected in H.M.S. Africa,

and Samson took off from it in Dec., 1911. The platform, erected forward of the superstructure, could not be used for alighting. Airbags were therefore fitted to the undercarriages of early ship aeroplanes so that they could alight on the water alongside the parent ship. But this was unsatisfactory. It was realized that it was essential for the aeroplane to be able to alight on board a ship if it was to serve the real needs of the navy.

Flt. Comdr. E. H. Dunning piloted the first plane to alight on board the ship from which it was launched. On Aug. 2, 1917, he made a skilful landing in a Sopwith Pup on the forecable launching deck of H.M.S. Furious while she was under way. Five days later, during a second attempt, the Pup rolled off the deck, fell into the sea, and Dunning was drowned. The Furious was then fitted with a landing deck aft.

On July 19, 1918, aeroplanes flown from this ship destroyed a Zeppelin shed at Tondern. The *Furious*, originally designed as a cruiser (1916), underwent yet a third conversion. In 1925 she was commissioned as a flush-deck aircraft carrier. In her first conversion she carried 8 aircraft (Pups and Short seaplanes); in her second she carried 16 aircraft (Sopwith Camels and $1\frac{1}{2}$ -Strutters); in her third conversion she carried 33 aircraft, and in this form continued in commission and served in the Second Great War.

H.M.S. *Argus* was the first aircraft carrier with a flush deck; and the first to embark (Oct. 19, 1918) a squadron of torpedo-carrying aeroplanes. Her complement was 20 aircraft.

The *Furious* and the *Argus* were the only real aircraft carriers (as distinct from parent ships) in commission during the First Great War. They were followed between the two Great Wars by the *Eagle*, *Hermes*, *Courageous*, *Glorious*, and *Ark Royal* (completed 1919, 1923, 1928, 1930, and 1938, and carrying 21, 15, 48, 48, and 60 aircraft respectively). The speed of these aircraft carriers varied from the 20 knots of the *Argus* to the 31 knots of the *Furious*.

Other Countries

The Royal Navy, having pioneered the aircraft carrier, was followed by other nations' fleets. Japan's first aircraft carrier, the *Hosho*, was converted in 1922, to be followed in 1927, 1928, and 1933 by the *Akagi*, *Kaga*, and *Ryujō*. In 1921 the U.S. Navy fleet-collier *Jupiter* was converted to an experimental aircraft carrier and rechristened the *Langley*; she had a flush flight deck, and carried 30 aircraft; her speed was 14.9 knots. The first U.S.N. Fleet aircraft carriers were the *Lexington* and the *Saratoga*, both converted from battle cruisers under the Washington Treaty. They were completed in 1927, had a speed of 33.35 knots, and carried 72 aircraft. The *Ranger*, launched 1933, was the first U.S.N. aircraft carrier to be so designed from the outset. The first R.N. aircraft carriers so designed were the *Hermes* and the *Ark Royal*.

When the Second Great War began, there were 23 aircraft carriers in service in the world: U.K., eight; U.S.A., seven; Japan, seven; France, one (the *Béarn*, converted in 1927 to carry 36-40 aircraft, with a ship speed of 21.5 knots). The German *Graf*

Zeppelin, launched in 1938, was never completed; she was designed to carry 40 aircraft, with a ship speed of 32 knots.

AIRCRAFT OPERATION. Airfield runways are measured in yards, are seldom less than 800 and may be 3,000 or more yds. long. Aircraft carrier flight decks are measured in feet, are seldom more than 800 ft. in length, and, in the smaller classes of ships (escort and merchant aircraft carriers) may be about half that length. Aircraft flying from aircraft carriers must therefore become airborne during a relatively short run, the maximum length of which is arbitrarily fixed by the dimensions of the flight deck. Rapid acceleration is important, and engine reliability fundamental, for once the take-off run has begun it is seldom feasible to stop and try again.

Pre-determined Wind-speed

To overcome the runway handicap and enable the pilot to start his flight with assurance, it is necessary to establish artificial take-off conditions on the flight deck. Basically, this is achieved by creating a pre-determined wind-speed over the deck, to suit the particular aircraft and the load it carries. Advantage is taken of the natural wind, and the aircraft carrier steams head into wind during all flying-off operations. In conditions of calm, fast carriers, with speeds of about 30 knots, can operate their aircraft by steaming at or near full speed. The slower carriers may not be able to get enough wind-speed over their decks in these conditions, and other means must be sought to enable their aircraft to take off.

The wind-speed flowing over the flight deck gives the aircraft the equivalent of a running start. If, for example, an aircraft becomes fully airborne and controllable at 70 knots air speed, and is subject to a wind of 30 knots while stationary on the flight deck, it need only accelerate to 40 knots relative to the deck to obtain the necessary 70 knots relative to the air. So, when steaming into wind of sufficient strength, carriers can take advantage of the conditions to reduce speed and conserve the ship's fuel, consumption of which increases rapidly at or near maximum speed.

In aircraft powered with supercharged engines pilots can use the supercharger for the few seconds of take-off to obtain

additional power for the period of acceleration from the standing start to the fully airborne condition and its succeeding initial climb. When absence of wind, or the shortness of the deck run, or the weight of the load carried by the aircraft, or any combination of these three conditions makes the ordinary take-off too hazardous, recourse may be had to accelerators.

ACCELERATORS. Accelerators are of two kinds, one external to and the other integral with the aircraft. The first kind is the catapult. In the earlier form of catapult the aeroplane to be launched was mounted on a trolley which ran along rails. The trolley was propelled by a ram operated by either compressed air or the gas pressure of a special cordite cartridge; the second method became the standard. For many years these catapults were used on aircraft carriers; they are part of the equipment of other types of warships that carry aircraft, e.g. battleships and cruisers; they were used in the catapult aircraft merchant ships that preceded the merchant aircraft carriers. At $2\frac{3}{4}$ G (gravity) acceleration these catapults launch landplanes and seaplanes from rest to flying speed (about 60 knots) in 30 feet.

These catapults obstructed the decks of aircraft carriers, and a later form placed the mechanism under the flight deck. A cable running within a slotted rail provided the means to apply power to the aircraft through a strop attached to the undercarriage. This unobstructive form of catapult applied the same accelerative force to a landplane taking off on its own undercarriage.

Rocket Assisters

Rocket assisters were later employed to provide additional power for take-off. Mounted below the wings, close to the fuselage, they are ignited electrically by the pilot during his take-off run, and give additional propulsion by jet reaction for four seconds, enough to complete the take-off run and start the aircraft on its initial climb. The number of rockets (i.e. the propulsive force) is varied according to the type of aircraft and the conditions of deck-length, wind-speed, and load.

LANDING-ON. Landing on a ship's deck has always been regarded as more hazardous than taking-off, and much care has been devoted to improving this

1 H.M.S. Battler, pocket carrier designed for convoy escort work. 2. Ark Royal; completed 1938, she had engaged in 32 war operations before her loss in Nov., 1941. 3 and 4. Implacable and Indomitable

operation. Wind-speed of sufficient strength and a true fore-and-aft air-flow over the deck are essential. The ship must therefore steam into wind, irrespective of the course of other ships which may accompany the carrier. Mechanical means have been devised to arrest the aircraft when it alights on the deck, and four stages of R.N. arrester gear development can be distinguished. These are as follows:

(1) Cables laid transversely across the deck with filled sand-

engaging mechanism on the aircraft is a landing hook, carried beneath the after part of the fuselage and lowered by the pilot when required. The pilot approaches in a curving flight to keep the deck in view, straightening into wind and deck just above and behind the stern. The relative correctness of his approach is signalled to the pilot visually by means of two bats, of table-tennis shape, handled by the deck flying control officer (the "batsman"). It is often easier to judge an

aircraft carriers were of different design, although some sister ships existed, notably the *Courageous* and *Glorious*, and the *Saratoga* and *Lexington*. The first aircraft carriers to be laid down (1937) for the R.N. as a class were the *Illustrious*, *Victorious*, *Formidable*, and *Indomitable*. These ships, like their predecessors, were fleet carriers—ships of 23,000 tons, capable of over 30 knots, carrying 16 4.5-in. dual purpose guns, and considerable deck and side armour to take knocks in addition to giving them. To compensate for their heavier armour they had one hangar for aircraft instead of the two superimposed hangars of the *Ark Royal*. Such ships are costly—the *Ark Royal* cost £3,500,000—but what is more important in war, they take some years to build. The Second Great War provided the first real experience of aircraft carriers in active service, and it became apparent that a sufficient number of units could not be provided in the large fleet carrier class to deal with the manifold duties of the air component of modern marine power. As a result, four distinct classes of aircraft carrier emerged. These were: (1) the fleet carrier; (2) the light fleet carrier; (3) the escort carrier; (4) the merchant aircraft carrier. The M.A.C.s were solely British. After three years' experience of war the U.S.N. laid down another class, a heavy fleet carrier with a displacement of over 45,000 tons, designed to carry larger types of aircraft.

Variations in British and American carrier design in armament, ship speed, armour, equipment, and the exact number of aircraft carried per ship produce additional sub-divisions among the carriers in each class; but it can be assumed that M.A.C.s carry one flight of aircraft; E.C.s two squadrons; L.F.C.s two to three squadrons; and F.C.s three to six squadrons.

Certain features are common to all aircraft carriers. Their superstructure is carried on the starboard side of the ship, and in the later ships is built out to offer the least restriction to the width of the flight deck, while remote control, applied whenever possible, is used to keep the dimensions of the superstructure to the minimum. Radio telephony and wireless telegraphy are used for communication between aircraft and carrier, ship and ship, and ship and shore. Direction-finding radio is used to give aircraft homing

Aircraft Carrier. Approaching with flaps and undercarriage lowered and arrester hook extended, a fighter pilot receives the land-on signal from the batsman
Photo, British Official

bags attached to either end; these cables, entangling in the undercarriage and tail-skid, helped to retard the aeroplane.

(2) Fore and aft cables, held a few inches above the deck by stanchions, to engage in special hooks carried on the fixed undercarriages of the aircraft. The hooks had non-return spring jaws to retain the cables. The purpose was to keep the aircraft on the deck once it landed, prevent it from swerving, and arrest its speed by friction between cable and hook. This gear was not a success.

(3) A period when no mechanical deck arrester gear was employed. Wheel brakes had then become common to all aircraft, and were used both to arrest the aircraft and to control it directionally during the landing-on.

(4) Transverse arrester cables controlled by hydraulic braking mechanism below the flight deck. The number of arrester cables varies in different ships, but four is the minimum. For take-off conditions the cables lie flat on the deck; for landing-on they are raised to a suitable height above the flight deck by hydraulic rams, two to each cable. The

approach from the deck than from the aircraft, and a good "batsman" gives valuable guidance to the pilot.

When the hook engages a cable, the aircraft is brought rapidly to a standstill. Although comparatively smooth, the braking is powerful, and the air crew must brace themselves to resist the inertia forces affecting them during the landing. This is the standard method of deck landing in the R.N. and U.S.N.

In the earlier period of deck landing, nets and palisades were erected along the sides of the flight deck to prevent aircraft from falling overboard; these are no longer used, but transverse crash barriers are fitted in many carriers to safeguard aircraft parked on the forward part of the flight deck from collision with aircraft failing to land-on or take-off, and to prevent aircraft failing to hook-on from running over the bow. Wind brakes are sometimes fitted to give protection to aircraft parked on the flight deck.

For types of ship planes, see table of aeroplanes on page 136.

SHIP DEVELOPMENT. Before the Second Great War almost all

bearings on the ship. In most ships radio beacons enable pilots and aircraft wireless operators to determine the approximate directional position of the carrier. All the naval carriers are equipped with radar, which, as on land, enables the approach of enemy aircraft to be detected, so that counter measures can be taken for the defence of the carrier or fleet against air attack; the same means can be employed to detect enemy ships and organize an aircraft strike against them.

In addition to the captain, who is responsible for the whole ship, and the commander (executive), who is responsible to the captain for the ship's affairs, an aircraft carrier has a commander (flying), who is responsible for the aircraft side of the ship's activities, and an air staff officer who is responsible for the organization of the air operations detail. There are briefing and intelligence rooms for the air crews; an operations room for the control of all operational air activities; readiness rooms for air crews; chart room and chart store (charts are greatly multiplied, for every aircraft must be supplied with charts, and not only the ship, as in other categories of naval craft); photographic section and meteorological office.

On the air operational side an aircraft carrier has to be just as fully equipped as any shore operational air station.

Ship's Complement

The complement of an aircraft carrier is large, for in addition to the ship's company there are the air crews, aircraft mechanics, and the aircraft handlers who are the flight-deck crews. In the larger carriers the officer complement is from 50 to 100 per cent greater than in battleships and cruisers.

Embodied in the ship's company and equipment are to be found the usual components of a big ship—chaplain, schoolmaster, ship's stores, workshops, blacksmith, carpenter, paintshop, surgeon, operating theatre, and sick-bay; engineers for the main engines, the hydraulic machinery, compressors, electrical generating plant, refrigerating plant, stokers (who are boilermen in oil-fired ships), electricians; galleys (electrified and very modern with monel metal fittings and electric hot cupboards); and canteen with, in some ships, a cafeteria. The hangar has a secondary use as a cinema. Lifts convey the aircraft from hangar to deck and vice

versa. The lift well provides additional stowage space. M.A.C. grain ships have a lift; M.A.C. tankers have no lift, and their aircraft remain on deck throughout.

The lighter classes of carrier are constructed on merchant ship lines. Their engine-rooms are laid out as in the Merchant Navy, and are properly called machinery space. Naval carriers, like other large warships, contain a damage control room, a centralised action station coordinating the safety measures in a crippled ship.

Since full administrative and operational control over the Naval Air Arm was returned to the Board of Admiralty in 1938, all the personnel of the Air Branch have belonged exclusively to the Royal Navy. All the ships' companies are also R.N., except in the merchant aircraft carriers, wherein the ships' crews are Merchant Navy, and in the escort carriers, wherein the engineers are Merchant Navy incorporated within the Royal Naval Reserve.

CARRIER STRATEGY AND TACTICS. Aircraft carriers are not now, as formerly, concerned only with safeguarding sea communications, but must also play their part in combined operations to give cover to the army before and after a landing, spot for ship's guns providing such cover, undertake visual and photographic reconnaissance for the army and the covering ships, and provide mobile fire power through their aircraft with bomb, rocket fire, cannon-gun, and machine-gun. Such actions, in cooperation with the army, or when deployed against enemy land targets in task force duties, can be maintained at high pressure only for relatively brief periods because of the supply position in aircraft, petrol, bombs, and other material, and must be prepared for in advance. In this respect the aircraft carrier operation differs from that of a land-based air force, such as a Bomber Command, whose function is to maintain continuous operations. But aircraft carriers can operate for long periods at low pressure activity. Their use thus falls into a strategic category which offers the elements of mobility of base, power of concentration of effort, surprise, and capacity of manoeuvre to avoid counter-attack.

The element of surprise is increased by the ability of the aircraft to operate from carriers at night, an air operation carried out in R.N. carriers either as prac-

tice or in exercises during the decade preceding the outbreak of the Second Great War.

The several types of aircraft carrier, with their varying speeds and ranges of action, different qualities of armour and ship's armament, and their capacity to carry the appropriate types of aircraft for specific duties, gave navies a new striking force which did not diminish but augmented their power in fleet actions, and enabled them not only to control the seas, but to dominate the once-feared coastal batteries and carry naval fire-power deep into enemy land territory.

Following the defeat of the Japanese naval elements in the battles of the Coral Sea, Midway, and the Philippines, and the continuous war of attrition in the Pacific, aircraft carrier supremacy passed in 1944-45 almost exclusively into the hands of the U.S. Navy and the Royal Navy, and for several years at least this predominance in naval air strength should remain unrivalled.

Aircraft Constructors, Society of British. An organization formed in 1916 by the principal aeroplane manufacturers of Britain to develop coordination in all matters of common interest. The full title of this body is the Society of British Aircraft Constructors, Ltd., and the offices are at 32, Savile Row, London, W.1. It has become the governing body of the British aircraft industry and, being recognized as such, has the cooperation of the Royal Aeronautical Society and the Royal Aero Club. Before the Second Great War the Society sponsored an annual display of military and civil aircraft at which prototypes and standard production machines were demonstrated before foreign diplomats, air attachés, and trade representatives. In the later phase of the war it took steps to formulate a comprehensive plan whereby the industry would maintain the position it had secured in world aviation. Amongst the essential factors which were investigated were the establishment of a wide scheme for training in aeronautical engineering and a cooperative effort in scientific research and development.

Aircraft Escort Vessel. A class of ship introduced in the Second Great War to ease the situation in air-sea warfare when the employment of the U-boat and long-range aircraft by the enemy was intensified and seriously jeopardised Allied shipping.

A joint effort was launched by Britain and the United States to provide aircraft-carrying ships for convoys both by building these in British yards and by a large-scale conversion plan in America. The latter consisted in converting merchant ships into escort carriers. Great Britain produced the merchant aircraft carriers by the addition of flight decks on grain ships and oil tankers.

The first converted merchantman to go into service was the German ship *Hannover* which had been intercepted by H.M.S. *Dunedin* in March, 1940. A flight deck 450 ft. long and 60 ft. wide was built on her. Six Martlet shipboard fighters were carried aboard her, these being lashed to the deck as no hangar was provided. This ship, re-named *Audacity*, was sunk by enemy torpedo in the Bay of Biscay, December, 1941.

A great fleet of escort carriers was built by the United States, more than eighty having gone into service before 1944, and 38 were supplied to Britain under Lend-Lease, the Anglo-American scheme which came into operation in 1941. The length of these ships was about 500 ft. and the tonnage approximately 10,000. Hangar accommodation was built into the vessels so that they could each take 12 to 20 aircraft. They also had the "island control" (i.e. control of navigation, gunnery, flying, and radar centralised in a superstructure on the starboard side of the flight deck) and anti-aircraft armament.

The term aircraft escort vessel quickly became obsolete. See *Aircraft Carrier*.

Aircraft Establishment, ROYAL. Known as the Royal Aircraft Factory before the R.A.F. assumed the same initials this establishment, comprising numerous engineering workshops, an experimental and research department, aircraft hangars, and an aerodrome, was set up by the Government in the early days of flying, at Farnborough, Hampshire. Before the First Great War work was carried out there in the development of man-lifting kites, balloons, airships, aero-engines, aeroplanes, and wireless. Before and during the 1914-1918 period the prototypes of numerous aeroplanes were designed and built at this factory. Amongst the more renowned of these were the B.E., for which Sir Geoffrey de Havilland was responsible, the F.E., the R.E., and the S.E. types. The R.E.8 became

the standard artillery-observation machine used by the Royal Flying Corps in France until the end of the war in 1918, and the S.E.5 was one of the best scout (known later as fighter) aeroplanes of its time. R.A.F. 90 h.p. and 140 h.p. engines which were employed extensively in the First Great War emanated in the first place from the factory at Farnborough.

Between the wars the establishment continued to function, as an experimental and research station. Theoretical and practical work was done in the development of four-engined bombers and monoplane fighters, while the design of navigation and bombing instruments was revolutionised. Important tasks of the Second Great War were the development of airborne radar and improvement in air frames and engines for high altitude flying. In 1942 the first British jet aircraft was flight-tested here, and after the war improvements to guided missiles were made.

Aircraft Industry. Britain's first aeroplane factory was opened 1908 (see *Aeroplane*). British aircraft manufacturers established before the First Great War and still existing include A. V. Roe, Blackburn, Bristol, Handley Page, Short, Sopwith (now Hawker). On March 29, 1916, the Society of British Aircraft Constructors was founded. Many new firms entered the rapidly growing industry during that war, and some of these continued in it thereafter. The S.B.A.C. now includes in membership every established aircraft and aero-engine manufacturer in Britain,

and the majority of the suppliers of aircraft parts, materials, instruments, and accessories.

In May, 1935, when the Air Ministry expansion programme "E" began, the industry employed about 22,000. The government shadow factory scheme was instituted April, 1936. In 1938 employment was about 100,000. On May 14, 1940, the Ministry of Aircraft Production was formed. Persons employed by this supply department in Jan., 1944, numbered 1,821,000. This made aircraft manufacture the leading war industry in the U.K. Annual British aircraft production figures (excluding repaired aircraft and spares) were: 1936, 1,830; 1937, 2,218; 1938, 2,827; 1939, 7,940; 1940, 15,049; 1941, 20,094; 1942, 23,672; 1943, 26,263 (7,129 of these were four-engined heavy bombers). Total for the whole war period, 1939-45: 125,500.

The U.S. aircraft industry in Aug., 1944, employed 1,910,000. From July 1, 1940, to the end of 1944, it produced 246,845 aircraft. Of these, 28,471 were heavy bombers. Figures of output of new aircraft do not, however, form the only basis for comparing production in British and U.S. war-time aircraft industries. The British industry was organized to repair aircraft and to provide spares on a scale never attempted in America. In the last year for which figures were available, 18,000 aircraft were repaired and returned in new condition, while spares production equalled between 50 and 60 p.c. of new aircraft output. The total British effort in that year was equivalent

Aircraft Industry. One of the great workshops in which were built up the fuselages of the Hurricane fighters, which helped to win the Battle of Britain in 1940

to the production of some 60,000 new aircraft.

Canada's aircraft industry employed 122,765 in 1943. Production of aircraft was in 1940, 846; 1941, 1,697; 1942, 3,811; 1943, 4,133.

Aircraftman. The lowest rank in the Royal Air Force is aircraftman 2nd class. Immediately above this rank are aircraftman 1st class and leading aircraftman (L.A.C.). In peace-time promotion to 1st class takes place after 6 months' satisfactory service as aircraftman 2nd class, and to L.A.C. after one year's satisfactory service as aircraftman 1st class. Pay varies according to the trade group in which the aircraftman is classified. A leading aircraftman wears a propeller badge on the arm.

Aircraft Production, MINISTRY OF. Government organization set up in Great Britain in 1940 to supervise to the fullest extent the manufacture of aircraft of all types. This ministry also exercised powers in connexion with the production of materials, accessories, units, and parts associated with aircraft built, assembled, and repaired in this country. Aircraft research and development in the Second Great War were carried out by a department of the ministry, this highly-specialised work including the examination, dismantling, and reconstruction of enemy aircraft that had fallen into our hands. It also controlled the civil organization, the Air Transport Auxiliary, which was formed in Sept., 1939, for the purpose of delivering aircraft from factories and depots to the R.A.F. and Fleet Air Arm. The first minister of Aircraft Production was Lord Beaverbrook. His successors were J. T. C. Moore-Brabazon, later Lord Brabazon of Tara; Col. J. J. Llewellyn; Sir Stafford Cripps; and Ernest Brown. In the Labour Government of 1945 the ministry was merged with that of Supply, under John Wilmot.

Aircraftwoman. Equivalent rank in the Women's Auxiliary Air Force to that of aircraftman in the Royal Air Force. An aircraftwoman may be 2nd class, 1st class, or a leading aircraftwoman (L.A.C.W.). Promotion in peace-time takes place at the same rate as for an aircraftman (*q.v.*), and pay varies in the same way, according to trade.

Air Crew. The flying personnel of the Royal Air Force, Fleet Air Arm, and other air ser-

vices. An air crew may consist of a pilot and observer-navigator or of captain, second-pilot, engineer, navigator, bomb aimer (known in U.S.A. as bombardier), wireless-operator, and three or more air gunners.

Air Crew Europe Star. British decoration of the Second Great War, its institution was announced May 18, 1945. It is an award for operational flying from U.K. bases over Europe from Sept. 3, 1939, to June 5, 1944. The ribbon, designed by King George VI, is light blue with black edges and a narrow yellow stripe at each side. The star, of yellow copper zinc alloy, is identical in shape with the seven other campaign medals of the Second Great War. See Campaign Stars.

Aird, Sir John, BART. (1833-1911). British contractor. Born in London, Dec. 3, 1833, Aird

joined his father as a contractor, and the firm soon built up a flourishing business. Having

Sir John Aird,
1st Baronet
Russell

erected the Crystal Palace in 1851, the Airds undertook the construction of railways, docks, etc., not only in England, but nearly all over the world, and after the

father's death the son was even more prosperous. In 1898-1902 he constructed the great dams at Assuan and Assiut on the Nile. From 1887 to 1905 he was Conservative member of Parliament for North Paddington, London, and in 1901 he was made a baronet. He died Jan. 6, 1911.

AIR DEFENCE: PRINCIPLES & METHODS

This description of how one of the major problems of total warfare was faced is written with the full authority of the Air Ministry. For further relative information see under Air Raids; Anti-Aircraft Command; Balloon Defences; Britain, Battle of; Fighter Command; Flying Bomb; Radar; Royal Air Force, etc.

The three cardinal principles of air defence are warning of attack, interception of raiders, and counter-bombing of enemy air bases. Enormous advances in method have been made since the First Great War, but these principles have remained the same.

Although the first German bomb fell on British soil in Dec., 1914, enemy airships continued throughout 1915 to attack without serious opposition, and it was not until the spring of 1916 that the defences noticeably improved. Warning of approach was the first to be systematically organized. Observer posts were sited at suitable points round the coast and occasionally out to sea. They relied on the human eye aided by binoculars, night glasses, and telescopes, and on devices to amplify the sound of enemy aircraft and enable their direction to be judged. Communication was by telephone to a central control.

Definite attempts to organize the warning system as part of a comprehensive air defence organization including fighter aircraft, anti-aircraft guns, and searchlights, were not made until the summer of 1917, when the reversal of the German attack to bombing aeroplanes after the failure of the Zeppelin raids made it imperative that the defence of London should be more effective.

The formation of a separate air defence command for London produced such an improvement that in the autumn of 1917 the Germans turned to raiding by night instead of by day.

At first the most effective form of defence at night was found to be the "box barrage," in which A.A. guns concentrated a cone of fire round an attacking force with the intention of forcing it to fly through the gunfire at some point. Later, methods of interception at night with the aid of searchlights were evolved, and in the biggest German raid, that of May 19, 1918, out of 40 Gothas which attacked London three were shot down in air combat and three by anti-aircraft guns. The armistice of Nov., 1918, found London with 284 guns, 377 searchlights, and 11 fighter squadrons.

In Sept., 1939, guns, fighters, and searchlights still formed part of the defence, but the discovery of radar (*q.v.*) had vastly altered the picture. In the First Great War the human eye and ear, instrumentally aided, were the only means of discovering hostile aircraft. From the earliest days of the Second Great War, Great Britain had in readiness a system of detecting aircraft before they came within human sight or sound. Air defence could now be regarded as in five stages: radar, giving the earliest warning of approaching

aircraft; observers plotting their course overland; fighters attempting to intercept; guns, aided by searchlights, trying to shoot them down; and finally barrage balloons preventing accurate bombing of the target itself. Smoke screens, camouflage, and decoy targets combined to make accurate bombing more difficult. The effectiveness of all these stages of defence depended largely on the first—the early warning of approach.

Radar stations positioned round the coast were able, under favourable conditions, to detect German aircraft even before they crossed the enemy-held coast. They were able to give the course, speed, height, and approximate number. At the start of the war the system covered only the approaches to London, but it was later extended to other vital parts of the coast.

Observation Posts

Once overland, the spotting and plotting of the enemy raider became the responsibility of the Observer Corps, which in April, 1941, became the Royal Observer Corps. The corps consisted of about 32,000 personnel, of whom 23,000 gave spare-time service. Each received special training in the observation, identification, and plotting of aircraft. They manned more than 1,000 R.O.C. posts situated round the coasts and vantage points inland.

Observation posts were equipped with instruments for spotting aircraft and measuring height, speed, and course. This information, together with the number of aircraft and an indication whether they were friendly or hostile, was passed by telephone to an R.O.C. centre. The average centre served between 30 and 40 posts, forming an R.O.C. group. Between them the groups covered the whole of the U.K.

The information from the R.O.C., together with that from the radar network, was combined and passed to the operations room of the Fighter group. Here the stage of warning ended and the stage of interception began.

Defence of Great Britain, 1940-41

At the time of the Battle of Britain, Fighter Command was organized into four groups, each divided into geographical sectors. A sector contained a headquarters and operations room of its own, together with one or more fighter airfields. At Command, at the groups, and at the sectors, the operations rooms differed in size,

but each included a large table-map showing the position and course of aircraft by means of counters moved by members of the Women's Auxiliary Air Force known as plotters. Through head telephones worn throughout their tour of duty, the girls received minute-by-minute information and transferred it to the table-map. Overlooking the table sat the officers responsible for conducting the interception and defence. At Fighter Command headquarters, in addition to the commander-in-chief, there was the commander-in-chief A.A. Defences, the Royal Observer Corps commandant, liaison officers from the Admiralty and from Bomber and Coastal Commands, and a ministry of Home Security official.

The C-in-C. exercised general control over the opening of A.A. gunfire and use of searchlights through the C-in-C., A.A. Command. He also controlled the balloon barrage and the civil air raid warning system. Group commanders decided which sector should meet any particular raid, and sector commanders detailed the fighter units. Normally, in order to prevent the shooting down of friendly aircraft, A.A. Command were allotted specified areas in which gunfire alone provided the defence, known as inner artillery zones. Other areas were detailed for fighters alone, and yet a third type of area would be the responsibility of either guns or fighters, depending on the orders in force.

When warning of the approach of enemy aircraft was received, simultaneous warning was sent out to the fighter airfields, to the gun batteries, to the balloon barrage, and to the authorities of the town or area which was thought to be the target. At the airfield the fighter aircraft took off and were directed towards the raiders by their sector operations room controllers over the radio telephone. Gun batteries opened fire at any enemy aircraft within range in the zones allotted to ground defence. Balloons were raised to the best defensive height. Sirens sounded to warn the target towns. (See Air Raid Warning.)

This was the system of defence of Great Britain in the summer of 1940. By Aug. 12, dozens of German aircraft employed to attack Channel convoys and ports had been destroyed by the Hurricanes and Spitfires of Fighter Command. On Aug. 15, 76 enemy aircraft were shot down, the record

for one day; and on Aug. 18 another 71. In the four weeks from Sept. 8 to Oct. 5, 3,291 day patrols were made by fighters.

A similar system, suitably adapted, was used to intercept the night raiders during 1940-41. Sector operations rooms sent up the fighters and directed them towards the attacking force—a process known as vectoring. The big difference between day and night interception was that from early in 1941 the night fighter carried its own radar set capable of detecting hostile machines to enable the hunting machine to "home" on to its quarry.

Once within range, the night fighter was often able to pick up the enemy on his own instrument, and finally to get within visual range of the aircraft and shoot it down. The most successful night was May 10, 1941, when night fighters claimed to have shot down 29 raiders. Total claimed for the month was 111, double that for April and five times that for March. The German attack on Russia in June, 1941, signalled the end of large-scale air attack on Britain, so that the problem of whether or not the British air defence could make the night raids as prohibitive in cost as day raids was never answered.

Fighters and A.A. Guns

Throughout the war R.A.F. fighters were of three main types—the single-seater single-engine type, such as the Spitfire and the Hurricane, the two-seater single engine, such as the Defiant, and the twin engine, such as the Beau-fighter and Mosquito. Comparable American types of aircraft were used, notably the Mustang and the twin-fuselage Lightning. The Hurricanes and Spitfires were at first armed with machine-guns, but were later converted to fire cannon or guns, or both. Heavier types of fighter were used to project rocket missiles.

Generally speaking, just as radar was the first line of the warning system and the observers the second, in the interception system the fighters were the first to meet the enemy and the guns the second. Once an enemy raider had penetrated the fighter screen, he was the responsibility of Anti-Aircraft Command. This command was also divided into geographical areas, but its guns were positioned chiefly around or in large towns or important target areas. Anti-aircraft forts, largely manned by personnel of

Air Defence. Chart showing measures used in Great Britain in the Second Great War. The perfection of radar—for early warning of an approaching raid, for tracking its progress for guns and searchlights, and for intercepting its course with the aid of day or night fighter aircraft—was the greatest single factor in the success of the system, but the human element at every stage also proved equal to every demand.

the Royal Navy, were also sited round the coast.

Instruments for the laying and firing of guns were much improved between 1939 and 1944. The biggest single step was the adaptation of radar to enable guns to be ranged and directed on to an unseen target. This device mainly replaced the expensive and often ineffective box barrage or massed shell-fire—a relic of the last war—as a defence against night raiders. It also eventually superseded the searchlight as a means of searching for high-flying raiders.

Another development was the mobile anti-aircraft gun, which made swift concentration of defensive fire possible, and the anti-aircraft rocket, the cheapest and most effective form of defence against low-flying raiders.

The average heavy A.A. battery contained up to eight guns, being connected by telephone to the gun

operations room and through this to the Fighter Command operations room, itself the link with balloons and searchlights. Rocket batteries and machine-gun units were part of a much more elastic organization, centred largely on industrial targets.

Until the opening of the flying bomb attacks in June, 1944, A.A. Command was comparatively inactive in Great Britain. Many batteries were transferred overseas, and others taken over by the Home Guard. By the autumn of 1944 Home Guard gunners were manning rocket batteries and 27 heavy gun batteries. The attacks with flying bombs necessitated a sudden revival of A.A. activity. Batteries were massed on the coast in the known path of the bombs, and with practice and improvement in predictor control eventually achieved upwards of 80 p.c. success in hitting their

targets. One day in August, 68 out of 96 flying bombs were shot down, and only four reached their target, London.

Fighter Command also experienced a great revival of defensive activity. The new Tempest fighter appeared, and achieved many successes in chasing and shooting down flying bombs. The most notable development from some points of view, however, was the success achieved by counter-bombing. For a whole year the launching sites of the flying bombs in France and Holland were attacked by bombers and fighters, more than 100,000 tons of bombs being dropped. As a result it was estimated that two-thirds of the potential air effort against London was stopped at source. Counter-bombing was also the method of defence adopted against the V2 rockets, launched chiefly from bases in Holland. This counter-

bombing also brought into prominence the work of the R.A.F. photographic reconnaissance aircraft and interpreters, who first detected the well-hidden enemy launching sites.

The part played by balloons in the defence of Great Britain was unspectacular but important. They were never intended to stop bombing, but they could and did force the bombers up to heights at which—for the Germans—bombing was inaccurate and heavy A.A. fire most effective. By the time the Allied air offensive on Germany was launched, bomb sights had become so improved that height was little handicap. (See Balloon Defences.)

From 1942 onwards air defence became a matter of more urgent concern to the Germans than to the British. A radar system similar to the British—and actually copied from it—was the backbone of the warning system. Day and night fighters were employed, as well as searchlights, balloons, and anti-aircraft guns. Anti-aircraft fire, or *flak*, was relied upon by the Germans to an enormous extent, particularly from heavy-calibre rail-borne guns.

The Germans developed skilful camouflage, extensive smoke screens, and cleverly built decoys and dummy buildings to a much greater extent than did Great Britain, where lack of space prevented full employment of devices of this kind. The increasing tempo and accuracy of Allied bombing forced them in the later stages of the war to practise widespread dispersal of industry and even the construction of entire factories underground. They also produced the last word in interception—the rocket fighter. None of these forms of defence, however, availed against the weight of the British and American attack.

Air Defence of Great Britain.

An organization and command of the Royal Air Force brought into being before the Second Great War to operate, as the title implies, to protect the country against hostile attack from the air. The title was dropped, to be replaced by those of Fighter Command and Bomber Command. The complex and highly efficient system of home defence incorporating fighter groups disposed at key positions, and an elaborate system of communication by means of radio and telephone between all fighter stations, searchlight stations, the Civil Defence warning system, and headquarters was built up by

Aire. From the base of the limestone cliff at Malham Cove (above) the Yorkshire river first emerges in full flow after an underground course

Air Defence of Great Britain and Fighter Command. It reached unparalleled heights of efficiency throughout the war. Early in 1944 the command reverted to its original title, Air Defence of Great Britain, when its chief was Air Marshal Sir Roderic Maxwell Hill. On this occasion the command was extended to embrace the R.A.F.'s own anti-aircraft artillery, manned by squadrons of the R.A.F. Regiment. At least one of these squadrons was stationed on each aerodrome in the command.

For the second time, however, the Air Forces allocated to the defence of Great Britain had their title changed, in Oct., 1944. A.D.G.B. was dropped and the name of Fighter Command (*q.v.*) was revived.

Airdrie. Municipal and police burgh and market town of Lanarkshire, Scotland. It is 11 m. E. of Glasgow, on the railway and near the Monkland Canal. It lies in a coal and iron district, and its industries include iron and brass founding, engineering, cotton and silk weaving, and paper-making. The buildings include the first free library in Scotland, opened in 1856, the present building dating from 1894. Airdrie and Coatbridge jointly elect an M.P. Market day, Tues. Pop. 25,954.

Aire. River of Yorkshire, England. It rises in the Pennines, though the exact source has been disputed. It is usually accepted that the stream flows into Malham Tarn and immediately follows a subterranean course. It then reappears from beneath the semi-circular limestone cliff wall of Malham Cove, a beauty spot 1 m. N. of Malham village. It then flows first S., then S.E. to join the Ouse above Goole. In its upper course it flows through Airedale, one of the most beautiful of York-

shire dales, but its waters become increasingly polluted in passing through the industrial area of the W. Riding. W. of Skipton is the Aire Gap, an easy passage through the Pennines into Ribblesdale, a route followed by the Leeds and Liverpool canal.

Aireborough. Urban dist. of Yorks (W.R.), England, formed

1937 from the former dists. of Guiseley, Rawdon (*q.v.*), and Yeadon (*q.v.*). It is mainly a residential area for Leeds and Bradford, and includes the vill. of Hawksworth, scene of W. Riley's novel *Windridge*. Pop. 26,190.

Airedale, JAMES KITSON, 1st BARON (1835–1911). English manufacturer. Born at Leeds, Sept. 22, 1835, he greatly developed the Yorkshire iron and steel industry. He served as Liberal M.P. for Colne Valley 1892–1907, received a peerage in 1907, and died March 16, 1911. Roland (b. 1882), his younger son, became 3rd baron in 1944.

Airedale Terrier. English sporting dog bred originally in Airedale, Yorkshirc. The Airedale

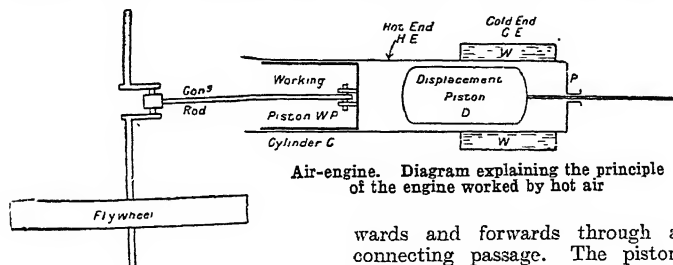

Airedale Terrier. Notable champion of a famous breed of large dog

is a large, tall terrier, weighing over 45 lb., with a rough, wiry coat, usually black and tan. He is a good retriever and a faithful watchdog companion. Airedales have been proved adept at police work.

Air Efficiency Award. A decoration instituted in 1942 for long and meritorious service in the Auxiliary Air Force and the R.A.F. Volunteer Reserve. It has a green ribbon with two central blue stripes. It was not issued until after the Second Great War ended.

Air-engine. Engine driven by hot air. It resembles the steam-engine in that the working fluid,

at the bottom and the other cooled by water. Rotation of the crank-shaft drives the air back-

Air-engine. Diagram explaining the principle of the engine worked by hot air

in this case air, is heated by the combustion of fuel not in actual contact with it. It is, therefore, an external combustion engine. It differs from other forms of heat engines in using the same bulk of working fluid over and over again.

The working principle is explained diagrammatically in the illustration. C is a long cylinder, closed at one end by a fixed plate and at the other by a working piston W P, connected by a rod with a crank-shaft and fly-wheel. The long closed piston D, mounted on a rod passing through a stuffing-box in P, is made to fit very easily, so that when it is moved to and fro air can pass freely between it and the cylinder. Part H E of the cylinder is heated by an external flame, while C E is kept cool by water circulating through a jacket W. It is obvious that, if D be moved to the right, the air will be driven to the hot end and be heated and endeavour to expand, while a contrary movement will force it to the cold end, where it will be cooled and lose its pressure. By connecting the rod of D suitably with the crank-shaft it is possible so to arrange matters that movements of W P and D are correlated. The action then is as follows: when W P is in the position shown, D is moving to the right and driving air into the hot end of the cylinder; expansion follows, and W P is driven out. By the time the working piston has completed its outward stroke, D is moving to the left, displacing air into the cold end of the cylinder and causing a fall in pressure, which allows the fly-wheel by its momentum to drive W P in again. The cycle is then repeated.

The principle described is applied differently in different types of air-engines. In one there are two separate vertical cylinders with pistons working a crank-shaft, one cylinder being heated

wards and forwards through a connecting passage. The piston in the hot cylinder is the power piston; the other returns air, when cooled, to the hot cylinder. Hot-air engines are generally inefficient, except for light work.

Aire-sur-Lys. Town of France, in the department of Pas-de-Calais. On the Lys, 12 m. by rly. S.S.E. of St. Omer, it is served by three canals and has leather, oil, nail, and flour manufactures. Its buildings include the 15th century church of S. Pierre and an 18th century town hall.

Airfield. Recognized as American term for any type of flying ground and the equivalent of the word "aerodrome" which until the Second Great War was commonly used in Britain. Aerodromes or airfields in the United States are frequently referred to as fields with a prefix, such as the Wright Field and Roosevelt Field. See Aerodrome; Airport; Airstrip.

AIR FIGHTING: ATTACK AND DEFENCE

Captain Norman Macmillan, M.C., A.F.C.

The subject is here discussed in its dual tactical aspect: (1) offensive, i.e. fighters attacking fighters or bombers; (2) defensive, i.e. bombing or reconnaissance aircraft defending against fighters. For strategy in the employment of the air weapon see Air Warfare. See also Britain, Battle of

TACTICAL OFFENSIVE. The factors governing the tactical offensive are height, speed, manoeuvrability, armament, sights, armour, and absence of blind spots. These are all dependent upon qualities in the aircraft determined in advance by the specification, design, and production experts. Other factors are personal: quality of flying training; physique; the seizing of superior height to gain the preliminary advantage of opening the attack, and determining its method; skill in taking advantage of favourable circumstances (for example, attack out of the sun to make it as difficult as possible for the enemy to see the attacking aircraft); the use of cloud cover to achieve surprise. Camouflage of aircraft may be useful in some conditions of sky and terrain. All these factors are relative between the opposing forces.

Tactical variations may be the outcome of operations over friendly territory or hostile; these may introduce the help or intervention of anti-aircraft fire and the assistance of ground control to one set of combatants, and may decide whether a descent by parachute will make the pilot a prisoner of war, a free man capable of fighting again, or a castaway in a dinghy.

FORMATIONS. R.A.F. fighter aircraft formations are built up from single aircraft into sections, flights, squadrons, and wings, with a leader for each component part,

and a deputy leader for the three larger components to assume command should the leader become a casualty. Formations usually fly in a V, diamond, or box; the aircraft in the rear are responsible for keeping a lookout behind to prevent a surprise attack from that direction. With single-seater fighters the rear aircraft must weave to right and left to enable their pilots to watch the sky behind the formation.

Communication between air crews is by radio-telephony. Code-words are used when necessary to prevent enemy aircraft or ground stations from comprehending the messages when they tune in. Individual aircraft are distinguished by a numeral, sections by colour, flights by a letter, squadrons by a number, e.g. Red 1, A Flight, 263 Squadron.

The formation leader can order his aircraft to change station in the formation, send one or more aircraft on a different course to investigate the nationality of distant aircraft, or change formation from V, box, or diamond into line, line astern, or echelon right or left, according to his judgement of the situation. Before closing with an enemy formation the wing commander can detail his squadrons how to attack, the squadron commander can similarly detail his flights, and the flight commander his sections. Methods of attack are standardised, and practised during training; they are known as attack No. 1, No. 2, No. 3, and so

on, each number corresponding to a given method or angle of approach. The exact formulae for attack orders are secret at the time of writing, but it can be stated that the numbered code denotes attacks from astern, three-quarter beam, beam, three-quarter front; port or starboard is indicated when necessary.

It is thus possible for the leader to detail a single pilot, a section, a flight, or a squadron to make a particular kind of attack at a given moment. When No. 263 squadron was in Norway in 1940, the commanding officer found his Gladiator fighters were slower than the German bombers. He thereupon devised an entirely new form of attack which had not been laid down in the training syllabus of the R.A.F., and used it with success.

Fighter aircraft working in pairs form the most efficient close-action team, and no matter how large a formation may be when its attack is first made, within a few seconds its fighters will find themselves

operating individually, or in subsections of two.

ARMAMENT. Fire may be opened at a range of 1,000 yards, because of the comparatively heavy armament of modern aircraft, but it is usual to close to shorter ranges. There is no standard armament in fighter aircraft, and in air-to-air fighting 37-mm., 30-mm., 20-mm., and 15-mm. cannon-guns, and .5-in., .303-in., and .3-in. machine-guns have been used in various combinations by different air forces. The cannon-gun firing an explosive shell has a slower rate of fire than the machine-gun, is heavier, and has more weighty ammunition. The .5-in. machine-gun battery produces the greatest muzzle h.p. because of its combination of rate of fire, weight of bullet, and high muzzle velocity. Comparison of muzzle h.p. enables the relative fire-power of different aircraft armament to be evaluated. The following fighter armament combinations have been used: twelve .303-in. machine-guns; four

20-mm. cannon-guns; eight .5-in. machine-guns; four 20-mm. cannon-guns and six .303-in.

Air Fighting. Tail gun emplacement in the Flying Fortress
Courtesy of "Flight"

machine-guns; four 20-mm. cannon-guns and four .5-in. machine-guns; eight .303-in. machine-guns (Battle of Britain); two 30-mm. cannon-guns.

In single-seater fighters the guns are usually remote-controlled. British fighters' guns are fired pneumatically by means of a firing button on the control stick,

protected from accidental fire by some form of safety device. Each of the eight Browning guns carried by the British fighters in the Battle of Britain had 300 rounds of .303-in. ammunition and fired at the rate of 1,200 rounds a minute; bursts of from one to five seconds were fired. During the air Battle of Berlin, Luftwaffe fighters used rocket projectiles, not very successfully, against Allied aircraft. These rocket projectiles are fired electrically.

The reflector sight (first invented in France), in which the image of the sighting circle is projected on to the windscreen, was a great advance on the earlier ring-and-bead and Aldis tube sights. During the Second Great War the British reflector sight was improved by the addition of an electric computer which corrected automatically for the speed and for the

relative angle of flight of enemy aircraft after the pilot had given the instrument certain basic data settings.

ENGAGEMENT. In fighter-to-fighter actions pilots endeavour to get on to the tail of the selected enemy aircraft, which, being able to fire only straight ahead, is then most vulnerable. The pilot of the aircraft thus engaged must turn to escape the fire, and manoeuvre becomes all-important. The aircraft that can turn in the smaller circle will escape its opponent's fire and eventually get on the other's tail and be able to stay there. Escape by diving is dangerous, for the attacking aircraft can also dive and fire a no-deflection shot. But cloud cover sometimes makes it possible to dive out of sight and so escape, although German pilots in Norway often hit mountains by adopting this practice. Climbing in a turn is useful, if it does not result in the aircraft's stalling and losing height. Skill in flying, exceptional marksmanship, and extreme courage are the characteristics of successful fighter pilots.

Some fighters carry a crew of two, e.g. Blenheim, Beaufighter, Defiant, Mosquito, Messerschmitt 110 and 210, Black Widow. The second member of the crew may have a rear gun or guns, or be simply a navigator. The Defiant pilot had no guns. The rear gunner operated the complete battery of four Browning .303-in. machine-guns. Luftwaffe pilots mistook it for a Hurricane or Spitfire and dived on it from above. One Defiant gunner shot down five Junkers 87s over Dunkirk. His squadron, No. 264, shot down 37 enemy aircraft in one day (May 29, 1940).

TACTICAL DEFENSIVE. Bombers are usually equipped with a number of guns, each covering a wide arc of fire. Fighter pilots endeavour to find a blind spot in the bomber's field. Bombers protect one another's blind spots by flying in suitable formation. Fighter pilots therefore try to split up bomber formations. To distract the crew of a bomber it is usual for more than one fighter simultaneously to attack one bomber.

Flying Fortress bombers, designed to operate by day in face of severe enemy opposition, carried 13 .5-in. machine-guns. Their long range, volume, and wide field of fire made Fortress air crews redoubtable opponents of German day fighters. At one period of the

war escort Fortresses were used carrying 30 .5-in. machine-guns and two 20-mm. cannon guns, but they were not fast enough and their use was discontinued. Long-range day fighters escorted the bombers. Until near the end of the European war British night bombers had only .303-in. machine-guns. Intruder fighters assisted them by engaging enemy night fighters.

NIGHT FIGHTING. Night fighter pilots are selected for excellence of night vision, and receive special

Air Force Cross and Medal, awarded for courage and devotion to duty while flying

training. Before going on patrol they wear dark glasses to accustom their eyes to darkened light. Night fighters operate as single units or, when numbers are engaged in the same area, in an open formation, usually with line astern characteristics.

Intruder night fighters operating over hostile territory usually select known airfields as their hunting ground and attack aircraft taking off or returning from missions.

The most difficult factor in night fighting is to determine the range of aircraft, and collisions are often narrowly averted. Aircraft searchlights have been tried, but expose their user to location, and consequent fire. Radar (*q.v.*) equipment provides means to intercept, range-find, and sight when ground control is not available or when ground control has placed the night fighter within measurable range but not visual distance of the enemy. Extreme fire power is vital in night fighting, for opportunities to fire are fleeting and often non-recurring. Land and ship night fighter tactics are alike.

The cooperation of searchlights, anti-aircraft fire, and ground control plays an important part in night fighter defence tactics. For night interdiction, see Air Warfare.

Air Force, ROYAL. A full account is given under Royal Air Force.

Air Force Cross and Medal.

British decorations awarded to members of the Royal Air Force and also civilians in recognition of acts of courage and devotion to duty while flying. They do not come into the same category as the Distinguished Flying Cross and Distinguished Flying Medal which are bestowed on R.A.F. officers, warrant officers, non-commissioned officers, and men for acts of gallantry when flying in active operations against the enemy. The Air Force Cross is awarded, for example, to service or civilian test pilots for courage while trying new types of aircraft or to R.A.F. instructors in recognition of meritorious work in training pupils. Civilian pilots who have established records or carried out brilliant long-distance flights have been decorated with the Air Force Cross on several occasions. Both the A.F.C. and the A.F.M. were instituted in 1918. The ribbon of the cross bears red and white diagonal lines and that of the medal is similar in colour pattern but the lines are smaller. The D.F.C. and D.F.M. ribbons have blue and white diagonal lines.

Air-gas. Gas composed of air and hydrocarbon, also called petrol air gas and gasoline-gas. When air is passed through petrol or similar light hydrocarbon it takes up a proportion of the hydrocarbon and is rendered inflammable. This is known as air-gas. It is necessary that the air should contain either under 2 p.c. or over 5 p.c. of petrol, because air saturated with between 2 p.c. and 5 p.c. of petrol is explosive.

The gas is luminous when saturated with larger amounts of petrol, but the less saturated air-gas is useful for heating gas mantles. The various kinds of apparatus are designed to give the proper mixture of hydrocarbon vapour and air and to work with as little attention as possible. The motive power may be either a falling weight, water power, or a hot-air engine. Air-gas is a substitute for acetylene as an illuminant in country districts, in the absence of coal-gas.

Airgraph. Form of postal letter sent by air mail and introduced in 1941, originally between H.M. Forces in the Middle East and Great Britain. The sender wrote the message, and name and address to which it was to be sent, on a special form which, on being submitted to the postal authorities, was photographed. A miniature

negative of it was then sent by air and, on reaching its destination, a photographic print, measuring 5 ins. by 4 ins., was made and subsequently delivered to the addressee. In Great Britain the service, after being widely used for rapid personal communication with various battlefronts and parts of the Empire, was discontinued in 1945, shortly after the end of the war when the considerable decrease in the total bulk of air mail no longer made the miniature size of the airgraph negative a necessity.

Air-gun. Weapon that is fired by means of compressed air. One variety has a lock which,

when the trigger is pulled, causes a needle to penetrate the door of a globular chamber under the barrel containing compressed air. A German type had the air chamber in the butt, and was loaded by winding the key in the butt with a crank. The air-gun commonly used for short-range sporting and target practice consists of a piston working in an air chamber controlled by a strong spring. The spring, being compressed by a lever attached to the barrel, is released by the trigger and the air in the air chamber is suddenly driven forward by the piston, propelling a bullet or pellet through the barrel.

other state's territory without landing and the right to land there for non-traffic purposes (e.g. to re-fuel). The five freedoms embraced, besides these two freedoms, the right to put down passengers, mail, and cargo taken on in the state of the aircraft's nationality, the right to take on passengers, mail, or cargo destined for that state, and the right to take on or set down passengers, mail, and cargo destined for or coming from any other state. At Chicago in 1944 Great Britain and the U.S.A. adhered to the Two Freedoms, but not the Five Freedoms, Agreement, although the U.S.A. had proposed, and continued to advocate the adoption of, the fifth right mentioned in the latter.

The nationality of an aircraft is that of the state in which it is registered, and every aircraft engaged in international aviation must bear markings showing its nationality and its registration letters. (See table under Aviation, Civil.) It must also carry certain documents, viz.: the certificates of registration and of airworthiness of the aircraft, the licences of the members of the crew, a journey log book, the licence of its radio apparatus, a list of any passengers and a manifest of any cargo it may be carrying. Annexes to the convention laid down rules in regard to the licensing of personnel, the grant of certificates of airworthiness, and various other technical requirements. They also contained Rules of the Air, the purpose of which was to prevent collisions (corresponding in this respect to the Rules of the Road at sea) and in general to ensure safety in air navigation.

Article 12 of the convention itself provided that these rules should be embodied in the various states' own regulations. "Each contracting state," it said, "undertakes to adopt measures to insure that every aircraft flying over or manoeuvring within its territory and that every aircraft carrying its nationality mark, wherever such aircraft may be, shall comply with the rules and regulations relating to the flight and manoeuvre of aircraft there in force. Each contracting state undertakes to keep its own regulations in these respects uniform, to the greatest possible extent, with those established from time to time under this convention. Over the high seas, the rules in force shall be those established under

AIR LAW: NATIONAL & INTERNATIONAL

J. M. Spaight, C.B., former Principal Asst. Sec., Air Ministry

How the growth of air lines and air transport necessitated new agreements is here explained, together with the terms of those agreements. See also Air Transport; Aviation, Civil

Aviation is essentially an international activity, and national legislation for the air must not only take that fact into account but must itself have as its foundation an international agreement or accord. National laws must be harmonised and coordinated, so far as is possible, if chaotic conditions in air travel and transport are not to arise. That need has always been recognized since the early days of flying. After the First Great War an international air navigation convention was signed at Paris by a large number of states, and it was on this convention that the law of the air for the United Kingdom and for British aircraft in general was based during the inter-war years. The convention of 1919, excellent in its day, inevitably became inadequate in some respects and was superseded by a new convention, adopted 1944 by an international conference in Chicago, which came into force Apr. 4, 1947. At the same time the provisional governing body set up in 1945 was established as the international civil aviation organization (I.C.A.O.), with h.q. at Montreal.

The purpose of legislation relating to flying is threefold: to ensure as far as possible the safety of those who go into the air, to protect persons and property on the ground from being endangered by the former persons' activities, and to safeguard the overriding interests of defence, revenue, and trade of the State itself. Like the convention of 1919, the new convention of 1944 contemplated the enactment by the participating

states of legislation designed to fulfil these purposes, and provided for the necessary conformity to an agreed standard of the national regulations that would result. It followed the earlier convention in starting from the principle of the sovereignty of the air. It provided, in Article 1, that "the contracting states recognize that every state has complete and exclusive sovereignty over the air-space above its territory." The completeness and exclusiveness of the sovereignty thus proclaimed were tempered, however, by Article 5, which provided that each contracting state would allow the civil aircraft of other contracting states not engaged in "scheduled international air services" to make flights into or across its territory or to make stops for "non-traffic purposes," that is to say, for all purposes other than the taking on or discharging of passengers, cargo, or mail.

Choice of Agreements

The scheduled international air services thus excluded from the right of free entry and passage—they are, broadly, the big air lines—were dealt with in two agreements appended to the convention, either of which a state was free to sign at its choice. One of these was called, officially, the International Air Transit Agreement, the other the International Air Transport Agreement. They were more commonly known as the Two Freedoms Agreement and the Five Freedoms Agreement respectively. The two freedoms accorded by the former agreement were the right to fly across an-

this convention. Each contracting state undertakes to insure the prosecution of all persons violating the regulations applicable."

The technical Annexes included one relating to Customs Procedures and Manifests. An aircraft going abroad or coming from abroad must take off from or land at a customs airport, and the formalities to be observed were laid down in the Annex. Under Article 24 of the convention aircraft on a flight to or across the territory of another contracting state had to be admitted temporarily free of duty, and the fuel, lubricating oil, spare parts regular equipment and aircraft stores on board were exempted from customs charges.

As in the convention of 1919, so also in that of 1944 the right of each state to declare prohibited areas for reasons of military necessity or public safety was recognized (Article 9). The same article allowed a state temporarily to restrict or prohibit flying over the whole or any part of its territory "in exceptional circumstances, or during a period of emergency, or in the interest of public safety." The restriction or prohibition was to be applied to all aircraft without distinction of nationality. Another article of great importance from the point of view of national defence—Article 89—gave the contracting states complete freedom of action in war or—and this was an addition, not to be found in the former convention—in any state of national emergency of which notification had been given to the council.

An International Council

The council referred to was to consist of 21 contracting states, elected by the assembly, the establishment of which was also provided for in the convention. The latter body, representing all the contracting states, was, so to speak, the parliament of the air, while the council was the executive organ. The business of the latter was to administer the technical Annexes, to collect and publish information relating to the advancement of air navigation, and to ensure that infractions of the convention were dealt with by the states whose aircraft might be concerned. The assembly and the council together constituted the International Civil Aviation Organization. They could be regarded as the beginnings of a world government for the air—a government that might well be merged some day, however far

ahead, in that ultimate international organization and supreme authority of which the Dumbarton Oaks plan was the first outline.

National Application

An international convention has not the force of law in Great Britain and Northern Ireland unless and until it has been embodied in this country's own legislation. It is so embodied by means of an enabling Act, supplemented by Orders in Council. That was how the convention of 1919 was applied to the United Kingdom. The new convention was subject to the same necessity. The Air Navigation Act, 1947, was followed by the Air Navigation Order, 1949, to give effect to it. This is a revised and consolidated version of an order dating back to 1923, and has in turn been supplemented by the Air Navigation (General) and Air Navigation (Radio) Regulations, which give the detail.

The responsibility for the administration of civil air matters rested before the First Great War with the home secretary. From 1919 until late in 1944 it rested with the secretary of state for air. A new minister—for civil aviation—was then appointed and it was he who had the duty of promoting any legislation.

Airlie, EARL OF. Scottish title borne since 1639 by the Ogilvy family. In 1491 Sir James Ogilvy was made a peer of Scotland as Lord Airlie, and in 1639 the 7th lord was made an earl. James, the 2nd earl, taken prisoner after Philiphaugh, was tried and condemned to death Jan. 16, 1646, but escaped just before his intended execution; the 3rd earl's son was attainted for assisting in the Jacobite rising of 1715, and another descendant for taking part in the rebellion of 1745. The attainders were removed in 1778. The 10th earl (1856-1900) was killed during the South African War, and his son David (b. 1893) became the 11th. The earldom is Scottish, and does not entitle its holder to a seat in the house of lords. The earl's eldest son is known as Lord Ogilvy.

Air Lift. Term used during the Second Great War for the total number of aircraft used to carry an airborne force into battle (see *Airborne Forces*, p. 189). The term was used in 1948-49, during the Russian land and water blockade of the western occupied sectors of Berlin, for the system of air transport of necessities organized by the U.S.A. and the U.K. This maintained those sectors in food, clothing, medical supplies, and some fuel for 462 days, from June 26, 1948, to Sept. 30, 1949. The total costs of the operation (excluding the value of the supplies) were over 252 million dollars to the U.S.A. and over £10,000,000 to the U.K. Well over 2 million tons of supplies were carried by aircraft of the air forces of both countries and by those of private charter companies.

The aircraft made in all, more than 277,700 flights to Berlin.

Air Lift. Form of pump for raising liquids from deep wells. Two tubes are placed concentrically inside the well bore, e.g. an outer tube 5 in. in diameter and an inner one of 3 in. bore. The outer tube is open at the bottom and extends farther down into the water or oil of the well; at the top it is sealed around the inner tube (which forms the rising main), except for a point at which a compressed-air supply pipe enters. When air under pressure is forced into the outer tube, it pushes down the water or oil, which rises up the

Air Lift. Pump for deep wells: compressed air forced between two concentric tubes causes water to rise in inner tube

inner tube. When all the liquid in the outer tube has been forced down to the level at which the inner tube terminates, air escapes up the inner tube, carrying water along with it. The compressed air mixed with this water lowers its density below that of the water in the space between the bore of the well and the wall of the outer tube; thus the denser water outside, by its greater weight, forces the lighter water-air mixture up the central tube or rising main.

The depth from which water can be raised by an air lift depends upon the depth to which the outer tube is immersed below the water level in the well or bore-hole.

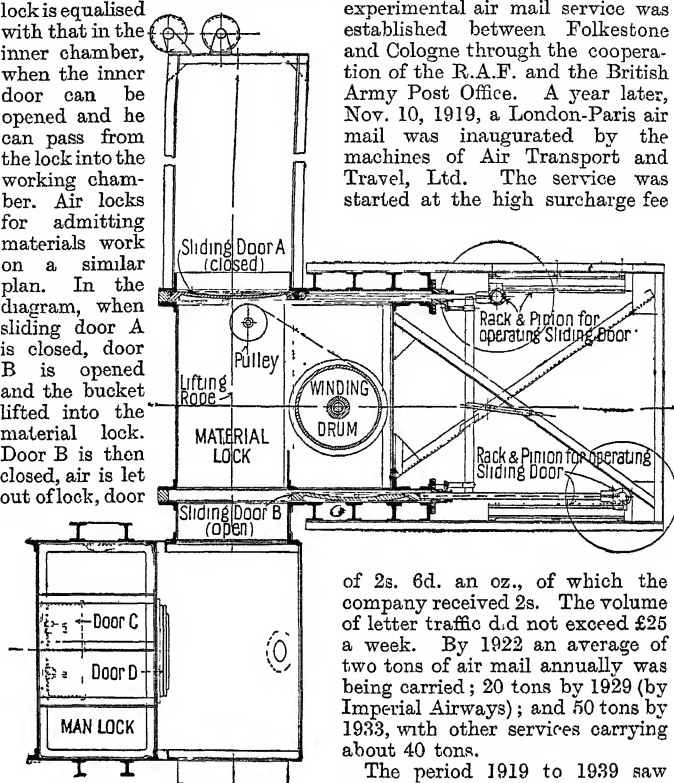

The most efficient result is obtained when the lift is three times the depth of the outer pipe in water.

Air Line. An operating company which plies for hire or reward in transporting passengers, freight, and mail by air. The first air line in Great Britain was known as Air Transport and Travel, Ltd. This concern started a daily passenger-carrying service between London (Hounslow) and Paris (Le Bourget) on Aug. 25, 1919. The aircraft was a converted D.H.4 bomber which could carry only two passengers and pilot. Later air lines were projected via Europe to the Mediterranean, the Dominions, and Colonies. Internal and feeder air lines were also introduced. In 1937 an unsurcharged Empire air mail scheme, carried out by the subsidised air line, Imperial Airways, began to operate over an England-India-Australia route. Trans-Atlantic air line services linking Britain and the U.S.A. were introduced by Imperial Airways and also by Pan-American Airways in 1937 as an experiment. During the Second Great War air lines were maintained in Scotland, to and from the Scilly Isles and Land's End, and between Liverpool, Glasgow, Belfast and the Isle of Man. British Overseas Airways, which absorbed Imperial Airways and British Airways in 1939, operated in association with the R.A.F. Transport Command and maintained its services to Stockholm, Cairo, India, South Africa, and Lisbon. This air line also introduced a weekly service to Canada and a service to West Africa. See Air Transport; Airways.

Air Lock. Airtight chamber giving admittance to a caisson or other engineering structure in which an air pressure is maintained greater than that of the outside air. Workers are able to enter or leave, and materials can be similarly moved, without loss of pressure in the workings. An air lock also serves as a compression or decompression chamber in which the pressure can be gradually varied (a) to equalise it with that in the workings; or (b) to lower it to that of the outside air. In its simplest form the air lock (see diagram) has two doors—one opening inwards from the outside air, the other opening outwards into the working chamber. To gain entrance from outside, a worker signals for the farther door to be shut; he then, by means of a valve, reduces the air pressure inside the lock until it is the same as that outside, when he enters

and closes the door. (The farther door is in the closed position.) He then admits air from the working chamber through another valve until the pressure in the

lock is equalised with that in the inner chamber, when the inner door can be opened and he can pass from the lock into the working chamber. Air locks for admitting materials work on a similar plan. In the diagram, when sliding door A is closed, door B is opened and the bucket lifted into the material lock. Door B is then closed, air is let out of lock, door

Air Lock of Sir W. Arrol. Its method of working is explained in the text

A opened, and the bucket lifted out, emptied, and returned to the working chamber through the lock by reversing the process. Door D is closed and door C opened, admitting men to the man lock. Door C is then closed; compressed air is admitted and, door D being opened, the men can descend into the working chamber below.

In order to prevent the complaint known as caisson disease, men entering or leaving workings in which high air pressure is maintained must remain in the lock while the air pressure is gradually equalised with that inside or outside, as the case may be; thus the air lock becomes a more complicated apparatus. See Caisson; Diving.

Air Mail. In 1911, to celebrate the coronation of George V, an air mail service was flown between Hendon and Windsor, the first to be established in Europe. It

bore a small mail of special picture postcards in envelopes, for the carriage of which the Post Office gave special authority. Immediately after the First Great War an experimental air mail service was established between Folkestone and Cologne through the cooperation of the R.A.F. and the British Army Post Office. A year later, Nov. 10, 1919, a London-Paris air mail was inaugurated by the machines of Air Transport and Travel, Ltd. The service was started at the high surcharge fee

of 2s. 6d. an oz., of which the company received 2s. The volume of letter traffic did not exceed £25 a week. By 1922 an average of two tons of air mail annually was being carried; 20 tons by 1929 (by Imperial Airways); and 50 tons by 1933, with other services carrying about 40 tons.

The period 1919 to 1939 saw the gradual growth of air lines all over the world. Working arrangements, compacts, and contracts were made on international lines and, once again, British Post Office organization was in the van of international understanding and internal air development.

At the outbreak of the Second Great War air mail was reaching from London to New Zealand and all the important key points on the way. In Europe the air mail system reached out to Bergen, Helsinki, Tallinn, Moscow, Bukarest, Zurich, and Athens; and the extra-European lines covered North and South America, Africa, the East Indies, and China. The annual dispatch rate of air mail had risen to nearly 3,000 tons, and 90 per cent of it was conveyed in British aircraft.

Although international air mail, in its broad peace-time sense, came to an end with the outbreak of the Second Great War, air mail development over Allied areas was intensified and brilliantly adapted to Service purposes. The

airgraph (*q.v.*) system became a vital part of the air mail services. By the end of May, 1942, ten million airgraphs had been dispatched from the U.K. to the Middle East. The total weight of film involved was under one ton. If the messages had been sent in the form of ordinary air mail letters, they would have weighed well over 100 tons. At the end of the war in Europe more than thirty million postcards had been dispatched by air to the troops overseas and total air mail items carried were twenty times as many as in the first war year.

In the United States the transport of mail by air is carried out on an extensive scale. The domestic air mail system first showed a profit in 1938. In the fiscal year of 1943 a profit of 33,000,000 dollars was realized by the U.S. Post Office Department from the domestic air mail organization.

Air Marshal. Title of the third highest-ranking officer of the Royal Air Force. It corresponds to vice-admiral in the Navy and lieutenant-general in the Army. With other titles relating to commissioned ranks in the R.A.F., which total eleven, that of air marshal came into force in Aug., 1919, sixteen months after the two air arms, the Royal Flying Corps and the Royal Naval Air Service, were merged to become the Royal Air Force. The first air marshal was Lord Trenchard. The insignia of rank are one broad and two narrow rings on the tunic sleeve or great-coat epaulette.

Air Ministry. Department of State controlling military side of British aviation. It was formed in Jan., 1918, from the Air Board shortly before the Royal Flying Corps and the Royal Naval Air Service were merged to become the Royal Air Force. Control of the R.A.F. by the Ministry is wielded by an Air Council (*q.v.*) which has its authority from the Government. The president of the Council is the secretary of state for Air; the vice-president is the parliamentary under-secretary of state for Air; with these serve the chief of air staff, the vice-chief of air staff, the air member for personnel (responsible for personal services, medical services, Women's Royal Air Force, as well as education and chaplain-in-chief's department), the air member for supply and organization, the air member for training, the permanent under-secretary of state for Air (whose department in-

cludes directorates of accounts, contracts, public relations and civil aviation, finance, the Meteorological Office, and accidents), and two additional members.

The directorate of Civil Aviation (1919-45) had appropriate departments for the administration of control of air pilots' and navigators' licences, ground engineers' licences, the licensing and registration of aircraft, and the selection of aerodrome sites. A special department was incorporated to investigate and report on air accidents in which civil aircraft are involved. The work of the medical branch, which examined, at regular intervals, commercial

air pilots to ensure their physical fitness to fly while engaged in their calling, was undertaken in 1945 by the R.A.F. central medical board. During the Second Great War the Air Ministry was greatly expanded to meet the needs arising from magnitude and extension of Britain's air power. In Oct., 1944, the first minister of Civil Aviation (*q.v.*) was appointed, with cabinet rank. The ministry itself was formed in 1945, taking over all air lines and major airports. See Aircraft Production, Ministry of; Aviation, Civil.

Air Navigation. For consideration of this subject, see under Navigation.

AIR PHOTOGRAPHY: ITS USE IN WAR

Group-Captain F. C. V. Laws, C.B.E., F.R.P.S.

This article deals mainly with the great developments in the scope and technique of air photography as practised by the R.A.F. during the Second Great War. A note is added on its application to surveying, archaeology, etc.

Air cameras were first used for military air reconnaissance in France in 1915. Wooden press cameras were used by the observer over the side of the aircraft. Later they were strengthened and lashed to the fuselage, thus becoming crude semi-automatic installations. Later special air cameras were made, and some attention was paid to their installation in the aircraft and to devices for remote control, *e.g.* automatic plate-changing mechanism. No successful roll-film camera was made at that time, chiefly because the film stock available was not suitable for the purpose.

For some years after the First Great War the P. 7, a 5 × 4 in. plate camera, was the accepted R.A.F. pattern. The use of air photography for survey and mapping caused some improvement. In 1927 a 7 × 7 in. roll-film camera, fitted with an instrument panel giving time, altitude, angle, and sequence of each exposure, was used for the air survey of Singapore. This camera was later redesigned on a unit system, the complete camera consisting of six separate units, *viz.*, the body, or central portion, to which were fitted the lens and cone, the shutter, the gearbox, the instrument panel, and the film magazine. This camera, known as the F. 8, took 100 exposures and was equipped with a range of interchangeable lenses of 7, 10, 14, and 20 ins. focal length.

The F. 8 camera was considered too elaborate for general service

in the R.A.F., and a smaller and simplified version was introduced in 1930. It proved so successful that it has since formed the basis of over 80 p.c. of all R.A.F. cameras. Known as the F. 24, it is a 5 × 5 in. film camera with a magazine capacity of 125 exposures, and has five interchangeable lenses ranging from 3½ to 20 ins. in focal length. The camera is capable of completely automatic operation by means of a remote electric control which can be pre-set for a range of different time intervals.

The production of cameras using lengths of film up to 65 ft. in length and 8½ ins. wide had no counterpart in existing photographic practice. The first films were developed on huge spirals in tanks measuring 2 ft. in diameter. Against all photographic practice, a method was tried which consisted of winding unsupported film from one spool to the other and so on while it was immersed in the processing solutions. It proved a success and still forms the standard method for the hand processing of air films.

PHOTOGRAPHIC RECONNAISSANCE. At the outbreak of war in 1939, the main purpose of air photography in the R.A.F. was reconnaissance of enemy territory. It was found that this could be successfully accomplished only by using fast high-flying fighter aircraft, which could avoid enemy interception and *flak*. The Spitfire, and later the Mosquito, were chiefly used for this purpose,

generally flying at heights of between 30,000 and 40,000 ft. Cameras fitted with lenses of very long focal length—30 to 40 ins.—took 500 exposures of $8\frac{1}{2} \times 7$ in. To increase the ground covered by each exposure, two cameras were mounted so as to obtain a slightly oblique view to port and starboard, thereby covering twice the area at each flight over the target, both cameras being operated at the same time.

It became necessary at these high altitudes to protect the camera against the extreme cold. Various forms of electrical heating were tried, such as lens heaters and muffers, but the final solution was found in the provision of a sealed and heated camera bay, with heavy plate-glass windows for the camera apertures.

Photographic reconnaissance aircraft were formed into a special unit. The first of the units—P.R.U.s, as they were called—was formed in 1940 and was mainly responsible for the gigantic task of preparing and keeping up to date an air map of the major part of Europe. The necessity for dispersal and, later, new theatres of operation, resulted in the formation of a considerable number of these units both in Great Britain and overseas.

Concurrently with the development of new cameras, an entirely new technique for the processing and printing of air negatives was worked out. As many as 2,000 negatives might be brought back from one sortie, and as many as 20 sorties a day made by one photographic reconnaissance unit. Until 1941 the work was done by hand, and employed many hundreds of ground photographers. The introduction of the continuous film processing machine, which was capable of processing, washing, and drying a continuous length of air film at the rate of 240 ft. an hour, and shortly afterwards of the multiprinter, which could expose, process, and dry prints at almost three times that speed, put the photographic reconnaissance unit level with the most modern film laboratories. Not only was there a vast increase in production per man-hour, but with a system of photo-electric negative grading, the quality of the prints could be maintained at a uniformly high level.

The most up-to-date processing and printing machinery was installed in motor-drawn vehicles. These mobile units were equipped with their own power plant and

were fully air-conditioned for operation in any part of the world. They first went into operation in the N. Africa campaign, and by Sept., 1944, six complete sections, each consisting of five vehicles, were operating in France.

The importance of photographic reconnaissance in modern warfare can best be shown by giving a brief summary of its main uses.

LOCATION OF TARGETS. Photographic maps and often three-dimensional models were made of all possible target areas in enemy territory. From these it was possible to determine the exact areas for attack and to enable members of an air crew to familiarise themselves with their target and its surroundings before setting out.

BOMB DAMAGE ASSESSMENT. Air photography on the day following a raid provided the only immediate means of assessing the success of the raid. Large target areas such as Berlin were systematically destroyed by planning based on the detailed interpretation and mapping of damage after each raid. The progress of repair work could also be noticed and further attacks made at the opportune moment.

DECOYS AND CAMOUFLAGE. The systematic bombing offensive by

Air Photography. R.A.F. gunner using a camera-gun to record the result of his attack on an enemy machine

the Allies led to an elaborate use by the enemy of decoys and camouflage. Air photography proved to be the only accurate means of detecting these methods of defence. From both day and night photographs it has been possible to recognize and pinpoint all types of decoys known to be in use.

SHIPPING MOVEMENTS. Regular photography of enemy ports and

convoys provided the Allies with a comprehensive day-to-day picture of all enemy shipping. Such information was not only indispensable in the planning of air attacks, e.g. that on the Tirpitz, but considerably assisted in defensive measures for Allied shipping.

TROOP CONCENTRATIONS. The movement of troops, especially in desert areas where large distances are involved, was found almost impossible to follow without the extensive use of air photography. Even when movements were made at night, the sudden appearance of supply dumps could be used to deduce the build-up and concentration of troops in a particular area.

DISTRIBUTION OF INDUSTRY. An important aspect of interpretation was the study of the growth and dispersal of industry in enemy territory, and, in conjunction with ground intelligence, the estimation of the working capacity and essential requirements for raw materials. Over 80 p.c. of this information was obtained from air photographs.

TECHNICAL DEVELOPMENTS. Throughout the war, air photography was often the first and sometimes the only means of estimating the enemy's progress in technical warfare, e.g. air photographs taken from almost zero height provided the first information of the enemy's use of ground radar. Accurate plans of the construction and armament of enemy warships were also made possible.

COMMUNICATIONS. The systematic destruction of enemy railways and canals was a major objective of the Allied bombing offensive.

Air photographs made it possible to determine the most vulnerable points for attack, e.g. viaducts and bridges.

LOCATION OF V-WEAPON SITES. Following ground intelligence, a photographic reconnaissance of Peenemunde (q.v.) revealed experimental work concerned with the launching of a new type of aircraft. Similar constructions were noted in the Pas de-Calais area. A highly intensive photographic reconnaissance led to the

Air Photography. R.A.F. reconnaissance photograph taken a few hours after the bombing of the Möhne Dam, in the Ruhr, May 17, 1943. It shows clearly the 300-ft. breach through which the water surged, sweeping all before it

discovery of all 96 of these launching sites. As a result of subsequent bombing attacks not one of these installations was put into operation in its original form. In all, over 3,000 sorties were flown, and 1,200,000 prints were interpreted in the search for flying bomb sites. See Flying Bomb.

AIR PHOTOGRAPHY AND D-DAY. The particular application of air photography in preparation for the allied landings in Normandy in June, 1944, took the form of large-scale reconnaissance of coastal areas. Hundreds of sorties were flown, often at very low level, in order to build up detailed and exact models of all possible landing places. Defences such as coastal batteries and beach obstructions were estimated with great accuracy.

Other important military applications of air photography included night photography by use of a powerful flash—a practice which materially assisted the accuracy and effectiveness of night bombing—and cine-photography as a means of training fighter pilots and also for the recording of actual air-to-air and air-to-ground attacks. A 16 mm.

camera of specially robust construction was used for this purpose. It was mounted in the wing or turret of the aircraft so as to give an exact record of the target in relation to the pilot's aim at the time of firing.

Night photography on bombing raids was done with an open-frame F. 24 camera. The resulting pictures, although quite suitable for identifying the salient features of the target, were not sharp enough for detailed reconnaissance. To meet the need for such reconnaissance during the second battle of France, an open-frame camera with image movement compensation was evolved. An American camera, the K. 19b, which employed a photo-electrically operated shutter, was also used.

Image movement compensation, which is obtained by moving the film at the same speed and in the same direction as the optical image moves across the focal plane of the camera, was also successfully applied to day photography for obtaining needle-sharp pictures of enemy installations from fast, low-flying aircraft. Pictures of flying bomb and rocket sites obtained by this

means proved of special value in the planning of their destruction.

American equipment and technique was for the most part similar to that of Great Britain. The American camera was slightly more elaborate than its British equivalent and was built on a somewhat larger scale, the standard negative size being 9×9 in. as compared to the $8\frac{1}{2} \times 7$ in. of the British. German equipment was much larger and more elaborate. The standard German camera took a 30 cm. square picture with lenses of 25, 50, and 75 cm. in focal length. It weighed almost twice as much as the British equivalent. Consult Aero-photography and Aerial Surveying, J. W. Bagley, 1942.

The principal civilian use of air photography is in survey work and the making of maps. Soon after the end of the First Great War the devastated areas of France were remapped from vertical air photographs. In 1924 an air survey was made of the Irawadi delta, including 350 sq. m. of waterways and forests which could have been surveyed from the ground only with great difficulty. Since then air surveys have been made all over the world, especially in more

inaccessible regions, e.g. in Abyssinia, Canada, India, N. Rhodesia. A complete air survey of 120,000 sq. m. of Egypt was made in 1½ years over ground so difficult that the older method would have taken 15 years.

Both vertical and oblique photographs are made. Verticals are used for large-scale work, but when the ground is moderately flat obliques are easier to read. In the process of map-making the foreshortening is corrected by means of a grid of white lines placed over the print.

The making of air surveys has produced valuable and sometimes unexpected results in the spheres of mining, forestry, and archaeology. Important mineral deposits in the North-West Territories of Canada were discovered by this means. Air survey photographs of great areas have afforded a first intimation of the types and extent of trees and their possible value as timber. As for archaeology, in 1923 a study of R.A.F. photographs of Salisbury Plain, taken two years earlier, first revealed the line of the ancient avenue leading to Stonehenge. Since then air photography has been regularly employed by archaeologists. The Iron Age site at Woodbury, near Salisbury, was discovered by this means; in 1938 this site was acquired by the Prehistoric Society as a training-ground for archaeologists. Other archaeological dis-

coveries due to air survey include the Roman town at Caistor, near Norwich (1929), plainly discernible in air photographs beneath the fields of growing barley; prehistoric settlements and burial mounds in Wessex; the site of a wooden version of Stonehenge at Durrington, Wilts (1926); several ancient cities of Mesopotamia and Palestine; and Roman siege-works at Masada.

Air Pilot. A man or woman who has been trained in the art of flying an aircraft of the heavier-than-air type so that he or she is capable of controlling it alone, ranks as an air pilot after qualifying by passing regular tests. In the U.K. there are five forms of air pilot's licence issued to civilians. These are graded Student, Private, and (for professionals) Commercial, Senior Commercial, and Air-line Transport. Air pilots of the Royal Air Force and of Naval Aviation fall into a separate classification.

Airport. Name adopted by popular usage to indicate a commercial civil aerodrome or air station. It was not used in the original bilingual 1919 Convention Relating to International Air Navigation, wherein the term aerodrome (Fr. *aéroplane*) was used. In the Foreign Air Regulations handbooks issued by the Air Ministry from Oct., 1936, to Aug., 1939, for the guidance of air crews, Handbook No. 1, defin-

ing general procedure, used the terms air station and customs air station. In succeeding handbooks dealing with specified countries the term airport was used. But an Order in Council issued Feb. 2, 1939, again used the term aerodrome.

The terms aerodrome, air station, and airport are therefore interchangeable, with the first as the formal English statutory word, and the last the colloquial. Aerodrome, however, has the wider interpretation. Here may be noted the Transport Command term, air staging post, applied in 1944-45 to a traffic unit based on an aerodrome used for routing.

The growth of air transport, together with the development of wireless telegraphy and radio telephony, introduced flying control officers charged with the duty of directing the movement of aircraft, both in the air and on the ground. Difficult terrestrial conditions, increasing weight of aircraft, and need for weatherproofing of surface areas brought into being airports with runways surfaced by civil engineering methods instead of agricultural. The Royal Institute of British Architects formed an airports committee.

The simplest form of airport may have only one runway—the term for the taking-off and alighting strip—orientated into the prevailing wind, but major international airports such as Heathrow,

Airport. Aerial perspective view in a prize-winning design for an international airport for London. The outstanding feature is the system of one runway for take-off and one for landing. The central buildings are conveniently situated for both landplane and flying-boat operations
Courtesy of "The Aeroplane"

London, and Idlewild, New York, are increasingly elaborate.

Idlewild, 35 minutes by road from New York's centre, was built on reclaimed land, filled with silt pumped from Jamaica Bay. Half its estimated cost of £8,000,000 was chargeable to the Federal govt. Plans included a £2,000,000 administration building (containing banks, shops, restaurants, and bars) with five radial wings to serve as covered motor traffic lanes to and from the aircraft, with offices above, and overhead flat promenade roofs for the public. Thirty-five large hangars are to house main traffic aircraft, and smaller hangars feeder and private aircraft. Six runways 9 m. long, and 6 m. of taxiing lanes, laid with concrete to carry aircraft up to 130 tons weight, will handle an incoming and an outgoing aircraft every minute. Three runways 3,300, 2,700, and 2,500 yds. long were completed by 1949.

Heathrow was opened as London Airport (*q.v.*) on Mar. 25, 1946, and has, in the first instance, three runways, one 3,000 yds. and two

2,000 yds. long, and a perimeter track as a taxi-ing lane. Pending its opening, Prestwick (Ayr) and Hurn (Hants) were the main trans-ocean and intercontinental airports in Great Britain. On Nov. 1, 1945, the British government announced that all airports in Great Britain for scheduled services would be acquired by the ministry of Civil Aviation and pass into public ownership.

The salient features of an airport are runway approaches free from obstructions, with parallel runways, if used, not less than 1,000 yds. apart. The main radio transmitter must be sited well away from the airport, and aircraft monitored through it by remote control from the flying control room. Radio and radar direction finding; radio beacon approach and alighting systems; lighting systems for runways and periphery; fog dispersal installation; swift refuelling; crash and fire-fighting apparatus for runways and hangars; adequate external and internal rail and road communications—all these are essential in an airport that may cover 20 square miles.

nized in the British plan for air disarmament laid before the Air committee of the general commission of the League of Nations disarmament conference at Geneva, Feb. 21, 1933, by the marquess of Londonderry, then British secretary of state for Air. He said: "The United Kingdom government are prepared to subscribe to the universal acceptance of the abolition of naval and military aircraft and of air bombing, except for police purposes, provided only there can be devised an effective scheme for the international control of civil aviation which will prevent all possibility of the misuse of civil aircraft for military purposes."

But by then the German Third Reich had been created, and the air rearmament of Germany had begun. On March 25-26, 1935, Sir John Simon, British foreign secretary, and Mr. Anthony Eden visited Hitler in Berlin, and were told by him that the German air force was approximately equal in strength to that of Britain. From that time the stability of Europe was destroyed, and Hitler, brandishing the political threat of air power to hold off the Western democracies, successively incorporated within the Third Reich the remilitarised Rhineland, Austria, Bohemia, Moravia, and Memel, and in his penultimate attempt to seize part of Poland brought the world to war.

In 1936 the Italian army, having failed to defeat the Abyssinian tribal armies after four months of fighting, delegated to the Regia Aeronautica the task of making the first aerial gas attack in history. The Abyssinians, with no air force, and totally defenceless against mustard gas and bombs dropped from the air, were overwhelmed, except for bands that held out in the wilder parts of the country throughout the whole Italian occupation. The R.A.F. at that time was in no condition to challenge the Regia Aeronautica, and Britain's political influence had been seldom, if ever, lower.

A British civil aeroplane carried General Franco from the Canary Islands to Spanish Morocco, where his arrival precipitated the Spanish civil war of 1936-1939. In that war between the Spanish falangists and the Spanish socialists three great powers lent the aid of their air power, and German and Italian airmen and aircraft on the former side fought Russian airmen and aircraft on the other. Germany and Italy were in a more favourable

AIR POWER: ITS PLACE IN POLITICS

Captain Norman Macmillan, M.C., A.F.C.

The significant emergence of air power as a new force in international history is here examined in the light of its story before and during the Second Great War. For details of the organization and administration of air power see Air Warfare; Royal Air Force

Before the 20th century the balancing factors that swayed the issue of major diplomatic negotiations in international affairs were, in continental states, armies, and in island states, navies. But with the development of air forces into a powerful arm possessing qualities of mobility far exceeding those of armies and navies, a third and compelling influence was introduced into the arena of international relationships. The political emergence of air power occurred during the period between the First and Second Great Wars, when the term came to be regarded, *qua* power, as one signifying the international pressure which could be applied by the government of a nation in outward manifestation of its relative air strength.

The First Great War had scarcely ended when British air power was applied to maintain law and order in Somaliland, where the activities of the Mad Mullah were speedily quelled by the primary rôle played by the R.A.F. in the secret "Z" expedition of 1919. In 1922 the R.A.F. became the

controlling Service in the mandated territory of Iraq; from a few air stations at Bagdad, Basra, and Mosul it upheld the stability of government over a wide area at a fraction of the cost which control by land forces would have entailed. Air transport, later to have such overwhelming importance, was then only beginning, and the trans-desert air route was established as a military link between Cairo and Bagdad. So it came about that it was in the Middle East, and by the R.A.F., that troop-transport aircraft were evolved, and the ground forces of an army first came under the command of an Air C-in-C.

In two areas previously extremely difficult to control—the North-West Frontier of India, under the Army C-in-C., and in Aden as a Command—the R.A.F. provided an economic means to maintain stability through the superiority of its aircraft over the characteristic mobile raiding propensities of frontier and desert tribesmen.

The importance of air power for police purposes was thus recog-

geographical position, and their greater combined air strength compared with that of Soviet Russia helped the Falangists to victory.

Although air power is normally a term having international significance, more than once the internal affairs of nations have been affected by it. In the British strikes of 1921 and 1926 the R.A.F. was placed on stand-by mobilisation, and operated special communication aircraft. In the Chilean revolution of 1932 the air force took one side and the navy the other, and the navy was attacked from the air. The American Army Air Force carried the internal air mail during a cessation of the civil air mail services. The South African Air Force was used to quell a rising on the Rand.

Italians made the first belligerent use of an aeroplane in 1912 during the war against the Turks in Libya. But it was not until the First Great War that military air power was really developed. During that war Great Britain carried it to its greatest development. Thus a comparison of the growth of British air strength in the two Great Wars provides the best illustration of the development of air power up to 1945.

The First Great War

On Aug. 5, 1914, the British air service contained a naval wing, known as the R.N.A.S., a military wing, known as the R.F.C., and a central flying school. The R.N.A.S., controlled by the Admiralty, had one airship squadron (not long before taken over from the R.F.C.) and three landplane and seaplane squadrons containing 93 aircraft. The R.F.C., controlled by the War Office, had four landplane squadrons containing 179 aircraft. The combined personnel totalled 197 officers and 1,647 other ranks. On Aug. 13 four R.F.C. squadrons with 56 aircraft (all unarmed), accompanied by an aircraft park, proceeded to France. By Nov. 30 there were six squadrons in France, organized in two wings of three squadrons. In Jan., 1916, the first R.F.C. brigade was formed. At the conclusion of the armistice, Nov. 11, 1918, the R.A.F. with the B.E.F. contained 6 brigades, 17 wings, 84 squadrons, 5 special-duty flights, and 26 miscellaneous units.

During 1914-15 the R.N.A.S. made raids on targets at Cologne, Cuxhaven, Düsseldorf, and Friedrichshafen, but these efforts could

be only sporadic. In Oct., 1917, the 8th brigade, R.F.C., containing 3 squadrons, was formed at Nancy to attack the German chemical and iron industries; on June 8, 1918, this force became the Independent Force, R.A.F., with a total accumulated strength of 5 day-bombing and 4 night-bombing squadrons, and one fighter squadron. This force dropped a total of 540 tons of bombs.

The Air Ministry was formed in Jan., 1918, and the R.A.F. on April 1, 1918. In July, 1918, the Air Staff sought approval for 340 active service squadrons of an average of 20 aircraft each, but the War Cabinet warned the Air Ministry that the supply of men to maintain this strength and produce pupils for training as pilots might not be forthcoming. A total programme for 328 squadrons was agreed, and it was then anticipated that the war would continue into 1919. The actual figure attained by Oct. 31, 1918, was 200 service squadrons. The R.A.F. then had 27,906 officers, 263,842 other ranks, 22,171 aircraft, and 37,702 engines.

The British aircraft industry reached a peak employment of 350,000, and from Jan., 1918, to Oct., 1918, inclusive, produced 26,685 airframes and 29,561 engines. Excluding manufacture for the R.N.A.S. prior to March, 1917, for which no records exist, the British aircraft industry produced throughout the First Great War 47,873 airframes and 52,398 engines.

The operations of this large air force backed by a powerful industry were mainly concentrated on the Western front, where 6,904 enemy aircraft and 258 balloons were brought down or driven down, and 2,484 British aircraft were accounted missing between July, 1916, and Nov. 11, 1918. On that front 6,402 tons of bombs were dropped. On all fronts 7,908 enemy aircraft were accounted for, 2,810 British aircraft were lost, and 7,945 tons of bombs were dropped.

The Second Great War

The numerical first-line strength of the R.A.F. at the outbreak of war on Sept. 3, 1939, was about one-half that possessed when the armistice entered into force in 1918. But in the intervening years aircraft had developed, as the following examples will show. The S.E. 5A fighter of the First Great War weighed 1,953 lb. gross

and had a maximum speed of 132 m.p.h. at 6,500 ft. with an engine developing 210 h.p. Its service ceiling was 20,000 ft. The Hurricane fighter at the beginning of the Second Great War weighed 6,600 lb. gross and had a speed of 335 m.p.h. at 18,500 ft. with an engine developing 1,030 h.p. Its service ceiling was 35,000 ft. The S.E. 5A fighter's two machine-guns had been quadrupled. By the end of the Second Great War in Europe the Spitfire XIV fighter was flying at 450 m.p.h. at 40,000 ft., the Hornet, the fastest aircrew fighter, had a top speed of over 470 m.p.h., and the Vampire gas turbine fighter over 500 m.p.h.

Bombers and Bombs

The development of the bomber was no less remarkable. In the First Great War the most extensively used heavy night bomber was the Handley Page 0/400, fitted with two 275 h.p. engines. Its speed was 79 m.p.h. at 6,500 ft. when carrying 16 exposed 112-lb. bombs. Its gross weight was 12,230 lb., service ceiling 7,000 ft., and duration 8 hours. At the beginning of the Second Great War the Whitley heavy night bomber with two 1,030 h.p. engines weighed 25,900 lb. gross, and had a maximum speed of 245 m.p.h. at 16,250 ft., and a service ceiling of 25,000 ft. It carried a load of about two tons of bombs stowed internally, and could fly from 1,250 to 1,800 miles according to the disposition of fuel and bomb loads. By 1945 the Lancaster bomber carried a maximum bomb load of 22,000 lb., weighed gross almost 70,000 lb., and had a maximum speed of 275 m.p.h. and a maximum flight range of about 3,000 miles.

Bombs increased in weight from the 112 and 230 lb. heavy bombs of the First Great War to the 4,000, 8,000, 12,000 and 22,000 lb. bombs of the Second Great War. Explosives of newer and more powerful kinds were developed, culminating in the atomic bomb (*q.v.*). Incendiary bombs became potent destroyers of cities instead of feeble and unreliable nuisance weapons.

During the Second Great War, R.A.F. Commands operating in Europe, the Mediterranean, and the Middle East dropped a total of 1,219,909 tons of bombs and mines, and lost 22,120 aircraft, including those so badly damaged on return to base that they were of no further use. Included are 33,865 tons of mines laid at sea or

in shipping lanes which cost the enemy over 550 ships sunk and more than 480 damaged. Bomber Command dropped 657,674 tons of bombs on German territory.

By the end of April, 1945, R.A.F. major air attacks, ranging from 500 to 5,000 tons bomb-weight, had been made on the following German urban military targets: Berlin 22, Cologne 18.

The power of Bomber Command, the modern independent air force of the R.A.F., was referred to by Air Chief Marshal Sir Arthur Harris in his order of the day to the Command at the conclusion of the Second Great War in Europe. He said: "Nearly 100 of Germany's cities and towns, including almost all of leading war industrial importance, lie in utter ruin, together with the greater part of the war industry which they supported. Railways, canals, and every form of transport fell first to decay and then to chaos under your assaults. You so shattered the enemy's oil plants as to deprive him of all but the final trickle of fuel. His aircraft became earth-bound. His road transport ceased to roll. Armoured fighting vehicles lay helpless outside the battle, or fell immobilised into our hands. His strategic and tactical plans failed through inability to move."

In that great bombing war the United States 8th (and to a lesser extent the 15th) Air Force played a parallel and vital part.

The dominating influence of air power was not achieved without loss. Fatal casualties in Bomber Command were not fewer than the numbers killed in Britain's national invasion armies. The U.S.A. 8th A.F. lost 40,000 men killed, missing, and prisoners of war in two years of operation.

Bomber Command's early failures in attack were overcome after intensified scientific research and the production of new instruments and methods. It became possible to bomb ever closer to the ground forces in their support. On the Normandy beaches, at the hinge of the battle of Caen, the Falaise gap, the defended Channel ports, St. Vith, Houffalize, and the crossing of the Rhine, bombs broke down the obstacles that barred the passage of the surface troops and reduced their casualties to a fraction of what they might have been.

During the Second Great War it was universally conceded that no military force could deploy and operate freely by land or sea

or under the sea without having first contained the air strength of the enemy. Italy, Germany, and Japan were all defeated only after their air power was overwhelmed.

The flying bomb, rocket bomb, rocket-gun, and atomic bomb have all added their quota to the power of three-dimensional war. The shattering development of air bombardment, and the ability to place large armies into otherwise unattainable fields of action and to maintain and support them there, increase the relative dominance of great nations over those whose man-power and national income do not suffice to produce such defence on a sufficient scale.

Air-pump. Pump used for exhausting or compressing air. The commonest form of air-pump is the ordinary inflater used to compress air into a pneumatic tire of a cycle or a motor-car. The essential features are a piston or plunger and a tube or cylinder in which it works. When the piston is drawn out to its limit the tube fills with air, and when the piston is pushed home the air is driven through the hole at the bottom of the tube, and a check valve, either on the tire or in the pump itself, prevents the return of the air when the piston is drawn back again. An air-pump for exhausting air is similar in principle, but the valves are reversed and thus the action is reversed. Complete exhaustion is, of course, impossible with an air-pump. A fairly complete vacuum is created by a mercury pump such as is used to exhaust the air in electric light bulbs. Engineers' air-pumps include compressors, which increase the air pressure on the high-pressure side of the pump, storing it for use in compressed air tools and apparatus, and blowers which are either rotary or centrifugal.

Air Raid Precautions (A.R.P.). An Air Raid Precautions dept. of the Home Office was formed April 1, 1935, the responsibility for civil defence in Great Britain being then taken over from the committee of Imperial Defence. The first official circular dealing with A.R.P. and drafting a general scheme was issued in July, 1935. In Dec., 1937, an Air Raid Precautions Act was passed, requiring local authorities in Great Britain to organize schemes of general precautions so that in the event of hostilities preparations could be well advanced to meet heavy air attacks against the civil population. Shortly

afterwards a booklet on National Service, explaining and classifying the various ways in which the public could volunteer to serve, was issued by the government to every household in Great Britain. Volunteers for A.R.P. came forward in large

A.R.P. badge of white metal, as worn by A.R.P. personnel 1938-41

numbers, and more than 5,000 local A.R.P. training schools were soon established. The first big A.R.P. exercise was held in 1937 at Southampton and Portsmouth. The first official A.R.P.

handbook, *Personal Protection Against Gas*, was widely circulated, and later a government booklet on A.R.P. in the home was distributed free. The public gradually became familiarised with the general principles of A.R.P. throughout the months immediately before the outbreak of war, and warden in particular made it their business to establish public confidence in the system. The white metal A.R.P. badge, worn on the lapel of civilian clothes, became an accustomed sight.

Air raid precautions in Berlin before the war were in advance of those existing in London, though Great Britain was ahead of any other country in the matter of gas-masks. France lagged behind Great Britain. Paris air raid shelters were few in number, and preparations in the French capital and the provinces developed only slowly.

On Sept. 1, 1939, the day Germany invaded Poland, a reserve of some 700,000 part-time A.R.P. workers was created in Britain to supplement those already enrolled. The voluntary workers far outnumbered the paid ones. Full A.R.P. machinery was put in operation from that date, including a complete black-out.

From Sept. 3, 1941, local A.R.P. services were re-named in groups, viz. Civil Defence Wardens' Service (C.D.W.S.), Civil Defence Ambulance Service (C.D.A.S.), etc., the letters C.D. being substituted for A.R.P. on uniforms of all civil defence forces.

From its inception the responsibility for A.R.P. in Great Britain devolved upon the Home Office, later the Ministry of Home Security. See Civil Defence.

AIR RAIDS: GREAT BRITAIN AND GERMANY

Captain NORMAN MACMILLAN, M.C., A.F.C.

This article gives the full story of the attacks on Great Britain by aircraft of the German Air Force and of the R.A.F. attacks on Germany and German-occupied territory. It deals with raids by piloted aircraft only. Details of attacks by Flying Bomb and Rocket Bomb are under those headings. For information about other air raids see under Japan; Malta; Spanish Civil War; and under such headings as Hiroshima, Pearl Harbour, Rotterdam, Tokyo, Warsaw, etc. See also Air Warfare; Bomb, etc.

1. ON GREAT BRITAIN

In the First Great War, 108 bombing raids on Great Britain were made by German aircraft, 51 by Zeppelin airships, 57 by aeroplanes. A total of 8,776 bombs was dropped, the first during an aeroplane raid over Dover, Dec. 24, 1914. Up to almost the end of 1916 the activity of aeroplanes was mainly confined to the S.E. coast area, and certainly did not extend as far as London. Their attacks were not greatly effective.

At the outset the Zeppelins presented a more serious problem for the defences. The first airship raid was made on the night of Jan. 19-20, 1915, over Yarmouth and Cromer, one ship over each town. Casualties were 4 killed, 16 injured. The killed were the first people in Great Britain to die by enemy action from the air. Further Zeppelin raids followed over coastal areas, even as far N. as Northumberland, and continued on moonlit nights throughout 1915 and 1916. The first enemy bombs to fall in the London area were dropped from a single Zeppelin on the night May 31-June 1, 1915. Damage amounting to £500,000 was caused in one London raid, Sept. 8, 1915.

Failure of Zeppelins

Gradually the defences against airship attack were strengthened, particularly in the London area (see Air Defence). After Oct., 1916, when several airships had been brought down either over Great Britain or on the homeward journey, the attack died down. A year later, Oct. 19-20, 1917, an attempted raid by 11 airships over the Midlands and London ended in complete failure, mainly owing to weather conditions. Because the defences did not need to go into action, being indeed deliberately withheld, this was long remembered as the "silent" raid.

The Germans then turned to the aeroplane again, introducing an improved bombing machine, the Gotha, with a larger Gotha added in 1918. The first aeroplane raid on London was made by a single machine on Nov. 28, 1916. The worst, from the point of view of casualties, was the daylight raid of June 13, 1917, when 22 raiders dropped nearly 100 bombs in the

Liverpool Street area, 162 people being killed and 432 injured. In a further damaging Gotha raid on July 7, 76 bombs were dropped over the city of London, causing heavy destruction as well as the death of 46 people and injury to 123. After this the defences were so quickly reorganized that the Germans switched to night raids. From Sept. 3, 1917, Gotha attacks by moonlight were the main feature of their attack, continuing somewhat spasmodically and with varying results until defence had once again caught up with attack. In 1917, 21 Gothas were shot down. The last raid on London, which was the last serious raid of the war, was on May 19-20, 1918, and was one of the heavier ones. Between 30 and 40 machines took part, and casualties were 49 killed, 177 injured.

Total British air-raid casualties in the First Great War: 1,413 killed, 3,407 injured (London area: 587 killed, 1,627 injured).

The Second Great War

The German air raids on Great Britain in the Second Great War were all strategic in conception; at no time did they become tactical in the sense which implies cooperative effort with surface forces. The Luftwaffe therefore had to operate over Britain with the advantage of ground control in favour of the defence. (See Anti-Aircraft Command; Balloon Defences; Fighter Command.)

The Italians made only a faint contribution to the German air attack on Great Britain. R.A.F. pilots believed that Italian aircraft occasionally formed part of the formations that flew over England during the daylight assaults of 1940, but none was brought down. The Regia Aeronautica's most notable ventures were two raids against shipping off the Thames estuary on Nov. 11 and 23, 1940, by Fiat C.R.42 fighters and Caproni 135 bombers; both ended in failure and rout, with the loss of 12 fighters and 8 bombers, and Italian raids against Great Britain ceased.

German air activity against Great Britain in the early days of the war mainly took the form of armed reconnaissance. In the evening of March 16, 1940, 14 Junkers 88 bombers attacked the

fleet anchorage at Scapa Flow; many of their bombs fell on land, and the first British civilian to die by enemy air action in the Second Great War was killed that evening at Bridge of Waith, Orkney.

The first German bombs to fall on the mainland of Britain exploded near Canterbury on May 9, 1940. German air attacks against industry in Great Britain began with a raid on Middlesbrough on May 24, 1940. But the first large-scale attack came in the night of June 18-19, 1940, when about 100 enemy aircraft crossed the coast between Kent and Yorkshire. Attacks on the same or a smaller scale continued until July 1, 1940, when the first daylight attacks were made, against Hull and Wick. The attacks thereafter increased in scale, until on July 9 this preliminary probing of Great Britain's air defences changed to the real attack.

Battle of London

Throughout the German air attacks of 1940-41 the strategic attacks against industry and communications were interwoven with planned attempts to smash down Great Britain's air defences. The first were mainly night attacks, the second mainly day assaults. (For the day assaults see Britain, Battle of.) The first great daylight raid against a British city was that on the afternoon of Sept. 7, 1940, which inaugurated the battle of London. The fires in the docks area were a beacon which brought the night bombers as surely as moths to a candle. Some of the day force of 350 bombers and fighters attacked aerodromes while the main body concentrated on London. The night force of 250 bombers attacked in a chain formation from 8.10 p.m. to 4.30 a.m. Air forces had not then learnt how to deal concentrated blows in darkness.

London was the first main target for the nightly blows of the Luftwaffe. From Sept. 7 until Nov. 2 there was an attack each night upon the capital. On one night only was the attack (for those days) light, when on Oct. 6-7 only one bomb fell. September was London's crisis month; 5,730 people were killed and almost 10,000 seriously injured in London and its environs. In the attempt

AIR RAIDS: TRAIL OF DEVASTATION FROM PROVINCIAL CITY TO COUNTRY VILLAGE

to make this the month of defeat for Great Britain, the Luftwaffe also hurled day bombers against the capital in a round-the-clock offensive. The Battle of Britain began at the end of that month to peter out to its own ragged end, but the fierce night attacks continued to fall upon London, and soon afterwards upon the larger provincial cities.

The great London raids of 1940 were on the nights of Oct. 15, Nov. 15, Dec. 8, and Dec. 29. The fire of London which raged all round St. Paul's occurred on the last of the four nights; over 100 bombers dropped incendiaries before midnight, and the enemy planned to follow with 400 tons of high explosive bombs after midnight, but fog closed down on the Continental aerodromes and spoiled his plan. Then followed the heavy raids of Jan. 11 and 12, Feb. 17, March 19, April 16 and 19, and May 10, 1941. The last of these brought the greatest weight of bombs to fall on London in one night—450 tons.

Provincial Cities

In some ways the most remarkable of the provincial raids was the attack on Coventry on Nov. 14, 1940, by about 400 bombers in full moonlight over a period of about 11 hours; 1,200 H.E., approximately 30,000 incendiary bombs, and 50 parachute mines were dropped. Bragging of it afterwards, Goebbels coined the word "to Coventrate."

Ports and industrial centres were the main targets for the night attacks—Southampton, Avonmouth, Liverpool, Birkenhead, Cardiff, Portsmouth, Plymouth, Swansea, Clydebank, Hull, Belfast, Birmingham, Coventry, Bristol, Sheffield, Manchester. Much damage was done, and many citizens were killed or injured, but the attack failed, not because its strategic conception was at fault, but because its technique was inadequate. The Luftwaffe had been built up to work with the army, not to wage independent strategic war, and by itself it could not cause sufficient damage to inflict a mortal blow to urban areas as large as those of Great Britain. Its bombers were really day bombers designed for speed, with fuselages too slim to carry enough bombs; they landed fast, and many crashed on their own aerodromes, being piloted by air-men insufficiently trained for night flying. The German air staff had not learned the art of mass assault in darkness; seldom could they

saturate the civil defence, and then only when water supply broke down, as in the London raid of Dec. 29, 1940, or with the shortage of fire appliances in Manchester on Dec. 23. Given equipment and courage, the fires were not uncontrollable. The German military leaders had overestimated the power of the individual bomber and underestimated the weight of bombs required to destroy a built-up area.

When on June 22, 1941, they invaded Russia, they acknowledged their first military failure. The Russian adventure absorbed most of the bombers of the Luftwaffe, and the scale of air attack against the United Kingdom never again reached its first proportions.

Apart from its main targets the Luftwaffe bombed coastal towns, small country towns, villages, and even farms. The following list of places gives some indication of the widespread nature of these attacks: Aberdeen, Bexhill, Bourne-mouth, Bridlington, Brighton, Clacton, Deal, Dover, Eastbourne, Falmouth, Folkestone, Fraserburgh, Great Yarmouth, Grimsby, Hastings, Hove, Jarrow, Lowestoft, Margate, Newcastle, Peterhead, Ramsgate, St. Ives, Scarborough, South Shields, Truro, Tynemouth, Walsall, Weymouth, Worthing; the list could be extended to include even fishing villages.

Baedeker Raids

In 1942 the strength of the Luftwaffe declined, while that of the R.A.F. rose. But the German air staff was stung into making some attempt at retaliation by the growing weight of R.A.F. attacks which followed the first concentrated area bombing of Lübeck on the night of March 28 and of Rostock on the nights of April 23, 24, 25, and 26, 1942. In what were called Baedeker raids (from the name of the publisher of German guide books) the Luftwaffe began a series of attacks against the cathedral cities of England. Exeter, Bath, Norwich, York, and Canterbury were the towns singled out for reprisals. These were sheer terror raids with no military significance. The forces employed were small—from 20 to 50 bombers in each attack—but were large enough to cause serious damage in such small cities, relatively unprotected against air attack. Over Exeter, for example, there flew no balloon barrage, and the bombers were able to fly low above the buildings in the neighbourhood of the cath-

dral and unload their cargoes of incendiaries with great accuracy, and almost totally to destroy the picturesque High Street. Yet in the majority of these attacks the Luftwaffe lost 10 per cent of the aircraft employed, and after a seven nights' run beginning on April 24, there were but two more, on May 3 and May 31.

There were only four important air attacks against the United Kingdom during the remainder of the year. Birmingham was attacked on the nights of July 27, 29, and 30; 26 bombers were brought down in the three raids, so rapidly was night-fighter interception improving. On October 31 a snap raid directed in the afternoon against Canterbury cost the enemy nine bombers for the loss of two R.A.F. fighters.

"Tip and Run"

1943 was notable for the still greater diminution of enemy air attacks on the U.K., despite the growing Allied air attacks on Germany. Shortage of aircraft forced the Luftwaffe to make attacks with small forces, and to avoid deep penetration beyond the coastal belt. Most of the raids were made by fighter-bombers, carrying one or two 500-lb. bombs or one 1,000-lb. bomb. The early part of the year saw a considerable number of these "tip-and-run" raids against the English coastal towns nearest to Continental airfields. But when Fighter Command Spitfires and Typhoons destroyed more than 60 of these enemy aircraft in three months, the Luftwaffe reduced this unprofitable activity. On Jan. 20 Typhoons shot down five of 15 raiders. More than 1,000 guns were deployed along the south coast. Often the German aircraft were over their target for only seven or eight seconds. Yet the gunners shot down 60 per cent of these raiders at Torquay and the figure rose to 65 per cent at Eastbourne.

German night attacks against Great Britain during 1943 were also made chiefly by fighter-bombers. They were on a small scale and were countered by improved night defences. Only one-third of the bomb tonnage that crossed the coast during the 1943 air attacks on Great Britain, aimed chiefly at London, was dropped in the Greater London area; the German pilots dumped their load outside rather than face the London barrage.

A.A. gunfire and aircraft interception brought down 306 enemy

The camera can record the results of air raids but only the artist's brush can do justice to the fantastic horror of a raid while it is in progress. These pictures of London under the German air attacks of 1940-41 were painted by men in the London fire service, J. Wallace Orr (top) and E. G. Turner

AIR RAIDS: FIRST-HAND IMPRESSIONS BY N.F.S. ARTISTS

raiders over Britain during 1943, 206 of them during the first six months of the year.

The diminution of the piloted raiders was still more noticeable in 1944, except for some brief but fairly heavy night attacks on London in Feb. and March. That was the year of the robot attacks. But almost at the end of the war in Europe, when the rocket attack was nearing its end, a brief return was made to the use of piloted aircraft. These last piloted attacks began on March 2, 1945, and were made by a variety of aircraft including Dornier 217, Focke-Wulf 190, Junkers 188, and Messerschmitt 410. They did not continue long, and the last "incident" of the whole war, recorded March 27, was due to a rocket.

Throughout the war London had 1,224 alerts. Total civilian casualties for London were 29,890 persons killed and 50,497 injured and detained in hospital. In all Great Britain during the war the air raid casualty list amounted to 60,585 persons killed and 86,175 injured and detained in hospital.

2. ON GERMANY, Etc.

The first British air raids on German soil were made in 1914 on airship sheds at Düsseldorf, Cologne, and Friedrichshafen by R.N.A.S. planes carrying four 20-lb. bombs. By 1917 the R.F.C. began to bomb military targets in the towns of western Germany. The weight of such attacks may be judged from the fact that a single ton of bombs dropped by a British squadron on Mannheim on Christmas Eve, 1917, was considered well worthy of record. The raids were continued in 1918, some damage being caused at Karlsruhe, where the main railway station was hit; at Cologne, where 33 bombs were dropped in one daylight raid in May; and to the Zeppelin sheds at Tondern.

In the Second Great War the first attack of R.A.F. Bomber Command was made on Sept. 4, 1939, when 10 Blenheim and 19 Wellington bombers flew to the Schillig Roads and Brunsbüttel respectively, to attack German warships. The Blenheims carried only two 500-lb. bombs each. Five Blenheims were lost. The pocket battleship Admiral von Scheer was slightly damaged. The Wellingtons did no observed damage at Brunsbüttel, and two aircraft were lost.

For many months afterwards a Cabinet instruction to the R.A.F. forbade the dropping of any bomb on German soil, and attacks were

therefore confined to warships. But when these were moored alongside docks, the bombs were not released lest some fell on shore. Losses were so heavy that these day attacks were soon discontinued. Thenceforward until almost the end of the war in Europe the R.A.F. heavy bombers were used with few exceptions, for night attacks.

During the winter of 1939-40, R.A.F. bombers flew far over Germany, over Czecho-Slovakia, and even to Warsaw and Vienna to drop leaflets. The long-distance leaflet raids were made by Whitley bombers of No. 4 group, using Villeneuve aerodrome in France as a staging post. The texts of the leaflets were kept secret from the British public. The excursions were good navigational exercises. They were also useful as reconnaissances. Little opposition was met.

When Germany attacked in the west in May, 1940, the French High Command required all Allied heavy bombers to be solely concerned with the immediate land battle. Up to the collapse of France the targets of Bomber Command were chosen by the French High Command. The *Comité de Guerre* insisted that no bombs should be dropped over troop concentrations in Germany lest they caused civilian casualties. Thus the first Allied bombing attacks on land targets were made over Norway, Holland, Belgium, and Luxembourg.

British Bombing Policy

However, on June 17, 1940, a bombing policy began that was solely British. Attacks were made that night on military objectives in Gelsenkirchen, Homburg, Wanne-Eickel, Essen, Hamburg, Aachen (Aix-la-Chapelle), Duisburg, Rheiydt, and Coblenz. At that period Bomber Command was not a large force; its greatest effort had been to muster 92 bombers to stand by to attack the German fleet during the invasion of Norway. The aircraft were all two-engined—Whitley, Wellington, and Hampden strategic night bombers and Blenheim day bombers. At the outset of the new policy, night bombers were sent out singly to pin-point and attack individual targets. Bombs weighing more than 500 lb. were very rare; 250-lb. bombs were the more usual load.

When Italy declared war in June, 1940, R.A.F. action against that country was obstructed by the French. A force of Wellington bombers sent to Salon aerodrome,

near Marseilles, was not at first allowed to take off to raid Italian targets. This opposition was withdrawn in time to allow targets in Genoa and Milan to be bombed on the nights of June 15 and 16, 1940. Meanwhile the first raid on Italy had been made from the U.K., on the night of June 11, Whitley bombers making a double crossing of the Alps to bomb the Fiat works, Turin, and the Ansaldo works, Genoa. Further attacks were made on Aug. 13 and Oct. 20, on industrial targets in Turin, Milan, Aosta, and elsewhere. Three attacks were made in Nov. and three in Dec., the most important target being the oil refinery and stores of Porto Marghera. Southern Italy was attacked for the first time on Oct. 31, 1940.

By the end of 1941 the power of Bomber Command had risen to a striking force of about 300 strategic bombers, with a proportion of 4-engined heavy bombers, of which 539 had then been built and delivered. The first 4-engined bomber, a Stirling, was in operation Feb. 10, 1941.

French and German Ports

Attacks had become less dispersed. On Dec. 17-18, 1941, a force of 101 night bombers attacked Brest, where lay the German battleships *Scharnhorst* and *Gneisenau* and the heavy cruiser *Prinz Eugen*. This was part of the great assistance given by Bomber Command in the waging of the battle of the Atlantic (*q.v.*). In the war against U-boats and other German warships of every kind, Bomber Command's attacks on Continental ports between Aug., 1941, and Feb., 1942, included 34 on Brest, 18 each on Le Havre and Boulogne, 15 on Dunkirk, 13 on Ostend, 12 on Cherbourg, 5 on Rotterdam, 4 on St. Nazaire, 2 each on Lorient, Calais, and Antwerp, and one on Bordeaux. Bombers were escorted by fighters in many heavy day attacks on the German warships at Brest and the submarine bases at St. Nazaire and Lorient. Even heavier attacks were made in the same period on the German ports where warships, U-boats, and aircraft were built and serviced, *e.g.* Emden, Hamburg, Kiel, Bremen, and Wilhelmshaven.

Attacks on such naval targets continued to the end of the war in Europe. The battleship *Tirpitz* and the cruiser *Prinz Eugen* were twice attacked where they lay in Trondhjem Fjord towards the end of April, 1942.

But the bombs of those days had little effect on heavily armoured ships, and the bomb-sights then used were inadequate for sighting such targets accurately from the great height needed to allow bombs to accelerate to high-impact velocity. It was not until Nov. 12, 1944, that the Tirpitz was sunk, in Tromsø Fjord, by the bombs of 29 Lancasters. These aircraft were equipped with the distant-reading gyro-magnetic compass feeding as a computer into the Mark XIV bomb-sight, and they carried streamlined 12,000-lb. armour-piercing bombs, which, falling from a height of 10,000 ft., impacted at a speed exceeding the 743 m.p.h. of sound.

The Big Bombs

Development of the bombing war was marked by the increasing weight of bombs. The first 4,000-lb. bomb fell on Kiel, March 31, 1941; the first on Italy, at Naples, Oct. 21, 1941; the first on occupied France, on the Matford works, Poissy, April 1, 1942. The first 8,000-lb. bomb fell on Karlsruhe, Sept. 2, 1942; on Italy, at Turin, Nov. 28, 1942. The first 12,000-lb. bomb fell on the Gnome-Rhône aero-engine works, Limoges, Feb. 8, 1944. All these bombs, commonly called block-busters, were normally used against specific targets where concentrated blast effect would produce the greatest results.

Streamlined armour-piercing bombs of large size were next introduced, with tail-fins designed to make them spin and impact with the accuracy of a shell. The streamlined 12,000-lb. bomb (Tail-boy) was first used against Le Havre harbour, June 14, 1944, to raise tidal waves among R-boat concentrations and swamp E-boat pens. The Germans constructed their submarine pens to withstand bombs of 7,000 to 8,000 lb., and the 12,000-lb. bombs took them by surprise, penetrating the concrete roofs at Brest. These bombs were also used against the Walcheren dykes on Oct. 3, 1944, and on two of the Rhine dams later the same month. The 22,000-lb. bomb (Grand Slam) was first used against the twin viaducts at Bielefeld, March 14, 1945; against the rly. viaduct at Arnsberg, March 15; against both these targets, March 19; against Bremen, March 21; against Bielefeld and Bremen rly. bridges, March 23; against the U-boat pens at Farge, March 27. Only R.A.F. British-designed bombers could carry these huge

bombs, and only specially modified Lancasters were capable of carrying the 22,000-lb. bomb, which measured 25 ft. 5 ins. overall length, and 3 ft. 10 ins. in diameter.

U.S.A.A.F. bombers in Europe did not carry bombs exceeding 2,000 lb. and lifted a maximum bomb load of only 5,000 lb. They devoted their ever-increasing activities to collaboration in the all-embracing scheme of bombing inaugurated by Bomber Command. The first U.S. attack, made Aug. 17, 1942, by 12 unescorted Fortress bombers, dropped 18 tons of bombs on Rouen rly. yards. Throughout 1942, U.S. attacks were confined to targets in occupied country, e.g. the Fives-Lille steelworks in Belgium, the Potez airframe factory at Méaulte, and shipyards at Rotterdam, and to various operations connected with the U-boat war.

Area Bombing

Meanwhile R.A.F. bombers were regularly dropping 4,000-lb. and 8,000-lb. bombs on German industrial targets in raids by 200 to 600 night bombers. The development of radar (*q.v.*) enabled mass raids to be made at night even under conditions of bad visibility, then quickened their speed and improved their accuracy. Eventually radar enabled air crews to see the night-obscured or cloud-obscured ground and to recognize towns or large factories. It penetrated all camouflage. A new experiment began with the attack on Lübeck, March 28, 1942, in which 304 tons of bombs fell in 180 mins. This was the first real British attempt at area bombing. The next month Rostock was bombed on four successive nights, and similar attacks followed on Stuttgart and Mannheim. Then on May 30 a force of 1,043 bombers was mustered, including aircraft from operational training units, and Cologne was bombed for 90 minutes. The greater part of the force consisted of Wellingtons, but there were also some Stirling, Halifax, and Lancaster 4-engined bombers. Forty-two were lost; but nearly 3,000,000 sq. yds. of Cologne were destroyed. Two more experimental night raids by 1,000 bombers followed, on Essen, June 1, and Bremen, June 25. The former was a failure, for the bombers did not find Krupp's works and dropped all their bombs 15 m. away from it.

Improved practice and the increasing use of 4-engined bombers steadily raised the scale from that

set by the first 1,000-bomber raid—750 bombers an hour dropping less than 1,000 tons—to 1,800 bombers an hour dropping 5,000–6,000 tons. But there were few targets which could absorb such a weight of attack in one blow without waste of effect due to the falling of bombs where damage was already complete. Saturation damage was achieved by an average ratio of one ton of bombs to every 50 inhabitants. So the population size of a city or section of a city to be attacked determined the size of the force employed, and the average heavy raid was subsequently made by 450–600 aircraft bombing for 15–25 mins. On March 12, 1945, however, over 1,000 Lancasters and Halifaxes dropped 4,900 tons on Dortmund in daylight with fighter escort.

Pathfinders and Master Bombers

The Mark XIV bomb-sight was first issued in Aug., 1942, to the Pathfinder force of Bomber Command, and later to all the command's aircraft. U.S. bombers employed the same sight under the designation T.2. The task of Pathfinder aircraft, manned by the most experienced air crews, was to outline the target area by pyrotechnic flares. The colour of the flares varied from one attack to another in order to thwart the Germans in any device of using decoy flares accompanied by dummy fires.

Later this technique was improved by the use of a master pilot who controlled the entire force by radio telephone and checked that the markers were in the correct position before the bombs went down. This development arose from the tactics employed on May 17, 1943, by Wing Commander G. P. Gibson, V.C. He was leading a force of 19 Lancasters in a day attack on the Möhne, Eder, and Sorpe dams. The breaching of the first two caused a torrent of 336,000,000 tons of water to sweep through industrial valleys, inundating Kassel and disrupting the power stations (*see picture, page 209*).

The first fully planned attack using the master-bomber technique was made against the Peenemünde V-weapon research establishment, Aug. 17, 1943.

Attacks were made in accordance with the requirements of a target selection committee, working in conjunction with the ministry of Economic Warfare. Broad direction of the campaign came from the minister of Defence and the chiefs of staff committee.

C-in-C. Bomber Command selected his target for the night with regard to priority, time of year (long-distance raids required long nights), weather forecasts, bombing battle plan, and variation of tactics to outwit German defences. Types of bombs were selected to suit the different targets. Often bomb size was in inverse ratio to the dimensions of a target. The smaller the target the larger the bomb, so that a near miss could be almost as destructive in its effect as a direct hit; on the other hand, against large built-up areas comparatively small incendiary bombs were capable of inflicting the greatest damage.

Day Attacks

Certain types of "precision" target were attacked by day with both medium and heavy bombers. In 1941 Blenheims bombed at various times Cologne power station, Ijmuiden steelworks, Rotterdam harbour, the chemical plant and power station at Mazingarbe, and targets in Rouen, Hazebrouck, Boulogne, Gosnay, Le Havre, and near St. Omer. They suffered heavy losses. In 1942 they became "intruders," attacking by night aerodromes in occupied countries.

In March, 1942, Bomber Command made on the Matford works, Poissy, its first attack with U.S.-built Boston medium day bombers. Other raids in which Bostons were used were made, with fighter escort, on such "fringe" targets as Caen, Le Havre, Rouen, Hazebrouck, Cherbourg, and Ostend. But when the type of bomb required was too heavy or the distance too far for medium bombers, the heavy bombers designed and armed for night operations had to be used by day for precision bombing. They flew without escort, but British fighters made diversionary sweeps to keep German fighters down. Thus the M.A.N. U-boat Diesel engine factory at Augsburg was attacked on April 17, 1942, by 12 Lancasters, of which 7 were lost. Like the Blenheims and Bostons, the Lancasters flew at tree-top height. Other major day attacks by heavy bombers in 1942 were made on submarine building yards at Danzig, Flensburg, and Lübeck, the Schneider-Creusot armament works in France, and the Philips radio factory at Eindhoven, Holland. But the risk was very great. Eventually night illumination of special targets became so developed that an individual building

within a target area of 500 sq. yds. could be accurately bombed from a low height.

Until almost the end of the war in Europe, British heavy bombers were armed only with .303-in. machine-guns, with a range of fire unequal to that of the cannon-guns of German fighters. Even at night, losses were often heavy. From a force of 800 attacking Nuremberg on the night of March 30, 1944, 96 were lost.

The U.S.A. 8th A.F.

U.S. heavy day bombers were equipped with at least 12 $\frac{1}{2}$ -in. machine-guns. Even so, their losses on deep penetration raids were at one time so heavy that a switch to night operations was seriously considered. Instead, the U.S.A. 8th A.F. embarked on a policy of smashing the German air force. Long-range day fighters were introduced, and a great programme of attack on German air factories was begun. The first target of the 8th A.F. in Germany was Wilhelmshaven, Jan. 27, 1943. With this, the trial period for both the R.A.F. and the 8th A.F. was over, and the real bombardment of Germany and occupied Europe began. From the beginning of 1943 onwards a total of 1,877,500 tons of bombs was dropped, of which British and U.S. strategic bombers were responsible for all but 92,000.

On April 17, 1943, 107 Fortresses bombed the Focke-Wulf fighter assembly plant at Bremen. The Germans, instead of rebuilding, removed the plant with its workers to Marienburg, on the Polish-Pomeranian frontier. On Oct. 9, 1943, U.S. bombers damaged 70 p.c. of the new factory. The Germans began to rebuild. On Oct. 9, 1944, U.S. bombers destroyed nearly 70 p.c. of the rebuilt factory. In these three attacks, typical of numerous others, the 8th A.F. lost 76 bombers and 8 escorting fighters, but they shot down 217 German fighters.

Oil and Railways

The Allies gained a valuable group of airfields in Italy with the capture of Foggia, Sept. 27, 1943. From there the U.S.A. 15th A.F. struck into Austria and S.E. Germany and eastward over the Balkans. From bases in the Middle East this force had already struck at the Ploesti oilfields in Rumania. From Italy it struck again and again until the output of these oilfields was a mere trickle. They also struck at natural and synthetic oil plants in Austria, Hungary, Po-

land, and Germany, and at the aircraft factories around Vienna and in southern Germany.

In reply Germany attempted to guard her vital supply services by concentrating almost all her aircraft production on fighters, as Great Britain had been obliged to do in 1940. Large scale air battles developed, and many bitter combats were fought over Germany and Austria between July, 1943, and March, 1944, by which time the Americans had won the battle. Throughout all its operations the 8th A.F. alone destroyed 15,439 aircraft; 11,232 in the air, 4,207 on the ground. German industry was forced underground. But it was too late for full production ever to be developed in those factories buried in the Harz and Thuringian mountains, where jet-fighters and V-weapons were made 800 ft. below the surface.

In March, 1944, the U.S. bombers added their weight to the British attack on oil installations. The combined forces smashed the oil plants of Leuna, Magdeburg, Politz, and the Ruhr. Before the defeat of Germany her oil production fell from a maximum output of 15,000,000 tons a year to zero.

The third great series of targets for combined British and U.S. bombers was the German rly. system. Photographs showed that by March 29, 1945, virtually nothing was moving in 26 rail-yards of the Ruhr.

The last bombing raid on Europe of the 8th A.F. was against the Skoda works, Pilsen, Czecho-Slovakia, April 25, 1945. By then the 8th A.F. had dropped a total of 701,300 (American) tons of bombs, distributed as follows: railyards 204,413; airfields 90,821; oil plants and chemical works, 75,019; aircraft factories, 40,837; U-boat yards and pens, 33,423; bridges and viaducts, 33,065; V-weapon sites, 30,971; armament plants, 25,819; other industrial targets, 16,040; fuel dumps, 8,941; ordnance depots, 7,046; ball-bearing plants, 5,086; experimental stations, 2,335; inland canals, 2,110; military installations and tactical targets, 51,512; all other targets, 67,882.

During 1943 nine of Germany's main industrial cities were so devastated by Bomber Command that they were forced to consume more than they could produce. Hamburg was attacked with great intensity from July 24 to Aug. 3, 11,000 tons of bombs falling on

Air Raids. Devastation caused in Berlin by Allied bombing in the later stages of the Second Great War. Here the shell of the Anhalter station is seen in the midst of a heavily damaged area

Photo, British Official Crown copyright reserved

city, docks, and shipbuilding yards. The area suffered about 67 p.c. damage. Barmen, one of the twin towns of Wuppertal, was 98 p.c. devastated by a single 1,000-ton attack, May 29, 1943. The real attack on Krupp's works at Essen began with raids in March and April, 1943. By the end of the year it was estimated that the works were permanently reduced to 60 p.c. capacity. In March and April, 1944, two 2,000-ton attacks were made on the partly repaired works, causing more damage than all the 1943 attacks. Out of 200 large buildings only 6 escaped.

On March 11, 1945, 4,500 tons were dropped on Essen, which received in all 15 major attacks. When Allied forces entered the town the following month, they found the Krupp works had been reduced to a series of empty shells of buildings and heaps of rubble.

Air Battle of Berlin

In the first R.A.F. attack on Berlin, Aug. 25, 1940, 22 tons of bombs were dropped. Subsequent attacks showed a gradually rising tonnage, but it was not until Nov. 18, 1943, that the real air battle of Berlin began. Between then and the following March, 16 major attacks were made by British heavy bombers, which released a total of about 25,000 tons on the Reich capital and

destroyed over one-third of the city. Later raids brought the total of major attacks on Berlin to 22. Mosquitoes of Bomber Command also carried their loads to Berlin with great regularity, making more than 170 attacks and dropping in all 7,000 tons of bombs. During the closing stages of the war they bombed Berlin on 36 consecutive nights. During this air battle of Berlin Bomber Command alone dropped 40,845 tons on the city, causing the destruction of 2,700 acres.

The 8th A.F. joined in the battle in 1944, with four attacks in March, one in April, and four in May. On June 21 over 1,000 Fortresses and Liberators dropped 1,300 tons on the city in a few minutes. On March 18, 1945, a still more formidable fleet of 1,000 Fortresses and 300 Liberators, escorted by fighters, dropped 2,500 tons on Berlin in daylight.

In the final surface assault on Berlin the Red Air Force was reported to have used 4,000 aircraft by day and 1,000 by night, but this was a tactical offensive. Moreover, the figures given are possibly those of aircraft sorties rather than of machines.

Bomber Command lost 9,120 aircraft in all these operations. It destroyed 758 German aircraft. In addition to Berlin and Essen, the following cities received major

attacks of from 500 to 5,000 tons: Cologne, 18 attacks; Duisburg and Stuttgart, 12 each; Dortmund and Hamburg, 11 each; Ludwigshafen, 10; Kiel, Dusseldorf, Homburg, Nuremberg, 8 each; Munich, Wanne-Eickel, Mannheim, Gelsenkirchen, Bremen, 7 each; Frankfurt - on - Main, Hanover, Buer, 6 each; Kamen, Bochum, Brunswick, Sterkrade, Neuss, Munchen-Gladbach, 5 each. Ten other cities received 4 such attacks; 14 cities and the Mittel-land and Dortmund-Ems canals, 3; 32 cities, 2; and 95, one. In all, 473 major attacks were made, including 70 against rlys., 69 against oil targets, 13 against airfields. Of these attacks 55 were on targets in France; Belgium had 11; Holland, 6; Czechoslovakia, 2; Norway, one. No strategic attacks of the kind were made on Italy.

The last attack by Bomber Command's heavy bombers was made against an oil target at Vallo on the night of April 25, 1945; but Mosquitoes bombed Kiel the following night for the sixth night in succession.

Red Air Force bombers were mostly tactical and medium bombers carrying relatively small bombs. The only 4-engined bomber used in any numbers was the TB-7, which could carry a bomb load of 8,000 lb. on short

range, or 4,400 lb. at a maximum range of 2,500 m. The TB-7 was used in night raids over Germany early in 1943, and on industrial targets in Hungary and Rumania. In 1944 it attacked lines of communication behind the retreating German armies. The other Soviet strategic bomber was the two-engined DB-3 and its development the DB-3F, both of which resembled the U.S. Douglas DC-3 civil transport or Dakota troop transport. The Soviet DB-3 carried a maximum internal bomb load of 3,300 lb. and was used to attack industrial and military targets, e.g. at Königsberg, Berlin, Tilsit, Helsinki, Bukarest, Budapest, and Breslau. At no time was the Red Air Force employed in combined operations to give bombing support to Allied zones in the west, though such support was frequently given to the Soviet armies by both R.A.F. and U.S.A.A.F. bombers. In 1944 U.S. bombers (and fighters) flew across Europe from U.K. or Italian bases, and alighted on Soviet territory, but by the end of that year the armies had drawn so close that such shuttle bombing had lost its advantage and was discontinued.

The following figures, given in British tons, show the growth of the annual tonnage of bombs dropped by the R.A.F. (Bomber Command in the U.K. and the R.A.F. element of the Allied air forces in Italy) and the U.S.A.A.F. (8th A.F. in the U.K. and 15th A.F. in Italy):

	R.A.F.	U.S.A.A.F.
1939	31	—
1940	13,000	—
1941	32,000	—
1942	45,500	1,500
1943	157,500	48,500
1944	547,000	578,500
1945	191,000	263,000

986,031 891,500

Air Raid Shelter. Structure to afford protection against aerial bombing. Deep shelters, excavated far below ground and strengthened with steel and reinforced concrete, with top cover of similar materials and a great depth of soil, can be constructed to protect key personnel or to accommodate factories, ammunition stores, control rooms, power plants, etc. A filtered and conditioned air supply is provided, with means for preventing this air from contamination by poison gas. Such a shelter will give protection against a direct hit by a bomb, though the improvement in penetration and the steady increase in size of aerial bombs as

time goes on provides a parallel to the "big gun *versus* armour" controversy.

Short of constructing deep shelters, use can be made of suitable existing tunnels, such as those of the deep underground railways. In Sept., 1940, the London Underground Rly. stations were opened to shelterers at night; a short section of the central "Tube" railway tunnel, between Aldwych and Holborn, was closed to traffic and devoted to the purpose of a shelter. Later, bunks were provided on the station platforms, and facilities arranged for food and refreshment. At the peak period 177,500 persons were being accommodated nightly; later the number fell to about 100,000. By arrangement with the government, extensions were put in hand in 1942 which would give additional accommodation for about 65,000 persons, and would provide in due time for a post-war development of the Underground rly. system. Eight deep tunnel shelters were completed in 1944, five being in use that July, giving night shelter to 12,000 in the month. Other types of deep shelter were contrived in caves, as at Dover and other places along the Kent coast where existing caves and the chalk cliffs afforded suitable natural facilities.

Trench Shelters

The simplest protection against aerial bombing is that given by slit trenches dug in the soil. Such trenches were dug in the London parks and other open spaces during the Munich crisis of Sept., 1938—open, unroofed excavations. Later in the year many of the trenches were made permanent, by being lined with reinforced concrete, roofed with arched steel members or with concrete slabs, and covered with soil. At this period London Transport constructed somewhat similar shelters excavated into embankments and buttressed with brickwork; many industrial concerns also provided protection for their workers, sometimes in fairly deep shelters but for the most part in surface or very shallow ones. The British government had announced in 1936 that the construction on any extensive scale of shelters which would be proof against direct hits by bombs was considered impracticable, a view which took some years to gain general acceptance.

Early in 1939 the Home Office authorised the manufacture of steel shelters which became known

as Anderson shelters (*q.v.*). Corrugated steel sheets of stout gauge, bent into an arched form, constituted the main body of the shelter, which was completed by vertical sheets at back and front. The steelwork was erected in a pit excavated in the ground, so that about half its height was below the surface. The soil removed was packed against the steel sides and heaped up over the arched roof. Strictly, therefore, the steelwork acted mainly as a "form" to retain the earth, and the latter provided the chief protection against penetration by bomb splinters. The Anderson stood up well against debris flung against or on it by bomb explosions, and also resisted blast satisfactorily. The standard pattern, supplied free to poorer people in vulnerable areas accommodated six persons.

Later Types

In view of later experience of bombing it became clear that the ordinary domestic house offered good protection against blast or the penetration of bomb fragments. The Morrison shelter (*q.v.*), a steel shelter for indoor use, was introduced by the British government in the early months of 1941. This was a table-like structure with open sides which could be closed in with a stout steel lattice. During the daytime it served as a table; at night, with a mattress under, it became a sleeping place.

Larger shelters on the Anderson principle, with steel framework, were built for factories and other concerns where many people needed protection. Basements of strongly built office blocks or other business premises were strengthened and used as emergency shelters. Similar accommodation was arranged beneath tenements and blocks of flats. Archways and vaults were used where available.

Surface shelters, made of brickwork 13½ ins. thick, roofed with concrete, and reinforced with steel, were built in the roadways or on wide footways of central London and other cities, and were constructed also in the suburban districts. They came through the ordeal well, and stood firm even when buildings all around had collapsed. They served to give refuge to people caught in the streets in daytime, or to those in residential areas where the houses were of light construction. Many were fitted with bunks.

For key personnel in factories and other buildings, whose duties

kept them out in the open during air raids, individual steel shelters were provided to be used in time of imminent danger. These were heavy, portable bell-shaped structures, with a door that could be closed by the occupants after entering. The strong steel walls were proof against penetration by bomb fragments, while the conical shape caused debris from collapsing buildings to fall off or, at the worst, to arch over the shelters.

In other parts of Europe protection against aerial bombs took the form mainly of strengthened basements or similar existing structures. Advantage was taken of caves, vaults, disused tunnels, etc. Extensive factories or other important industrial works were sited beneath hills, where entries could be made at ground level by a sloping adit. Disused mine galleries were utilised in the same way. In German cities immensely strong buildings of concrete, with walls and roofs nearly 10 ft. thick, were built as communal shelters. They were windowless, and were lighted and ventilated artificially. Moscow used its underground railway as a shelter, and resorted otherwise to basement shelters. The common practice in Continental towns of building working-class dwellings in the form of tenements or blocks of flats facilitated the use of basements or lower stories as shelters, suitably strengthened and protected by blast walls.

Air Raid Warning. In the series of moonlight raids on London made by German aeroplanes in 1917-18 a system was adopted of warning the public to take cover by the firing of maroons and the sounding of police whistles, the "all clear" being subsequently sounded by relays of Boy Scout buglers on bicycles. Experience of air bombing of large towns in the Spanish Civil War of 1936-39 made it clear that a more efficacious and more widespread system was necessary. A new system of signals planned in Great Britain in 1937 as part of A.R.P. experiments led to the adoption in 1938 of the siren or hooter. For two minutes this emitted a fluctuating or warbling note of a varying pitch and high penetration. These were supplemented by street warnings in the form of short, sharp blasts from whistles blown by police or wardens. The "raiders passed" signal was given by a steady note from the siren, also of two minutes' duration. In the event of a gas attack it was planned to give the

alarm by hand rattles, with handbells to sound an all-clear. Responsibility for sounding public warnings lay with the police.

In Sept., 1940, the Prime Minister, Mr. Churchill, referring to the "banshee howlings" of the sirens, announced that the duration of the signal would be reduced to one minute, and that it must be regarded as an "alert" rather than an alarm, so that interruptions to work in factories and offices should be minimised. A system of centralised warnings of imminent danger was introduced into government offices and war factories on Oct. 14, 1940; and other organizations followed a similar practice by introducing "roof-spotters" during alert periods. The public warnings were further modified in London and S.E. England during the flying-bomb attacks, June-Sept., 1944. Because of the frequency of the attacks (on one occasion London had 15 alerts in 24 hours) the alert was further reduced from eight wails to five. In the streets of London so many conflicting forms of "imminent" warnings could be overheard by people to whom the taking of cover for only a few seconds might be a matter of life or death that a Home Office order was issued to unify these, and to supplement them with local imminent warnings in the streets, to be sounded on klaxon horns. But the attack was defeated before this scheme was put fully into operation.

The first air raid warning in Great Britain was sounded at 11.21 a.m., Sept. 3, 1939; this was due to a French aircraft not immediately identified. The last was on March 28, 1945. The system of warnings was officially discontinued from May 2, 1945.

Germany adopted a system on similar lines to that of Great Britain, though in later stages of the war public warnings of approaching raiders were also given by radio. In France the system was again similar, though much less organized, pre-war preparations being chiefly carried out in the industrial north. China's system was tested as early as 1937, when she was invaded by Japan. Sirens were sounded in the larger towns, but in rural areas bells were used.

Air Records. Although it is quite usual for achievements carried out in the air to be described as "record" flights, strictly speaking no international air record is considered valid unless the performance has been officially verified by the governing

body, which is the Fédération Aéronautique Internationale. This organization is formed by the affiliation of institutions similar to the Royal Aero Club of Great Britain. Validity of a national air record depends on the claim being accepted by the national affiliated club in the country concerned. During the First Great War when the aeroplane underwent striking advances in design so that its performance moved forward proportionately the F.A.I. was unable to meet, and consequently no international records were passed during the period 1914-1918. But in the years between that time and the Second Great War enormous strides were made not only in speed but also in height, duration, and long-distance records. Most of these records were completely eclipsed by the performance of military aircraft used by the belligerents in the Second Great War, though, again, the F.A.I. was prevented throughout hostilities from functioning in regard to international records. By 1944, for example, fighter aircraft driven by the revolutionary types of power units, and known colloquially as "jet-planes," were capable of speeds in excess of 500 m.p.h. in level flight, while other machines powered with conventional types of engine were able to fly level at more than 450 m.p.h.

The more important air records achieved by airmen of the world in the past thirty-five years or more are:

SPEED. First official record, Marcel Prévost (Reims, Sept. 29, 1913), 124.5 m.p.h. Since then this speed has been surpassed innumerable times, and within twenty years the speed record was brought up to 440.702 m.p.h. This was achieved by Agello in a Macchi-Castoldi seaplane on Oct. 23, 1934. Three years earlier Flight Lieutenant G. H. Stainforth had set up a world's record when he reached an average speed of 407.5 m.p.h. in four runs with the Supermarine S.6 racing seaplane. It is to be noted that the highest speeds were attained by seaplanes, for at that time (1931-1934) the high landing speeds and lack of long runways on aerodromes made record-breaking with landplanes hazardous, if not impossible. It was the development of racing seaplanes for Schneider Trophy (*q.v.*) contests that actually produced this result. Thus in 1933 the world's speed record for landplanes stood at 308 m.p.h., exactly 100 m.p.h. less

1. Three-tiered bunks lining the platform of a Tube railway station, in this case Covent Garden
2. Entrance to an underground "trench" shelter in Green Park, London. 3. Inside the Green Park shelter.

4. Steel "pill-box," a type designed for the police and for sentries. 5. Surface shelters in Haymarket, London. 6. Anderson shelter, for domestic use, in course of erection 7. Two-tiered Morrison shelter for indoor use

AIR RAID SHELTER: VARIED TYPES FROM WHICH LONDONERS DEFIED THE NAZI BOMBS

than the seaplane record. The former was made by J. Wedell on Sept. 3, 1933, in the U.S.A., who flew a Wedell-Williams machine of 800 h.p. This record was surpassed by Howard Hughes, another American pilot, in 1935, when he established a record of 352 m.p.h. Then, five months before the outbreak of the Second Great War, a German, Fritz Wendel, claimed the world's air speed record after having flown his Messerschmitt Bf 109 R at 469.2 m.p.h.

The advent of jet-propelled aircraft during the war years made the setting up of new figures only a matter of time. On Sept. 7, 1946, a special version of Britain's first "jet" fighter, the Gloster Meteor, piloted by Gp. Capt. E. M. Donaldson, covered the official course off Littlehampton at an average of 616 m.p.h.—an increase of 10 m.p.h. over Gp. Capt. H. J. Wilson's record of the previous year, of 147 m.p.h. over that of 1939, and fast approaching the speed of sound.

During the Second Great War some remarkable high-speed flights were made across the North Atlantic by pilots of R.A.F. Transport Command both when engaged in delivering new aircraft to Britain and when transporting Allied statesmen and others from N. America to Europe. Outstanding among these flights was that achieved by Flight Lieut. H. C. Graham, who flew a D.H. Mosquito from Newfoundland to Prestwick, Scotland, March 30, 1945, in 5 hrs. 38 mins. The distance covered was 2,184 statute m., and the average speed was thus 387.6 m.p.h., or approximately $6\frac{1}{2}$ miles a minute. The machine was aided by a following wind. (See N.V. for later.)

HEIGHT. First official record, Legagneux (San Raphael, Dec. 28, 1913), 20,060 ft. Eight years later J. A. McCready broke the record by reaching an altitude of 34,184 ft. By Sept., 1936, the record fell to an R.A.F. pilot, Squadron Leader F. R. D. Swain, who climbed to 49,967 ft. in a Bristol aeroplane. Again, this was exceeded when on June 30, 1937, Flight Lieutenant M. J. Adam flew his Bristol 138 to 54,050 ft. On Oct. 22, 1938 an Italian, Lt.-Col. M. Pezzi, eclipsed this by flying his Caproni biplane to 56,100 ft. (See N.V.; also Balloon.)

DURATION. First official record, Landmann (Johannisthal, June 26-27, 1914), 21 hrs. 48 mins. 45 secs. By 1931 this remarkable record, which had been repeatedly

broken, fell to two Americans (Lees and Brossy), who remained in the air in their Bellanca aircraft for 84 hrs. 32 mins. Refuelling in mid-air, which was introduced a few years after the end of the First Great War, enabled aeroplanes to remain in the air for hundreds of hours, and so records of a new category were recognized. In 1929 two pilots, Mendell and Reinhart, of the U.S.A., flew non-stop for 246 hrs. 43 mins.; this exploit was eclipsed in the same year, when a Curtiss machine (flown by Dale Jackson and Forest O'Brine) flew for 420 hrs. 17 mins. In 1930 this duration-with-refuelling record stood at 553 hrs. 40 mins. (pilots J. and K. Hunter). (See also N.V.)

DISTANCE. First official record, Sequin (France, Oct. 13, 1913), 633 miles. Comparison between this distance traversed by an aeroplane and the distance record made twenty years later gives an idea of the immense progress made in the development of aeroplanes. Thus, on August 5-7, 1933, a Blériot flown by Rossi and Codos went from New York to Rajak, Syria, non-stop and in a straight line. The distance was 5,654 m.

On July 13-15, 1937, a Russian A.N.T. aeroplane, with M. Gromov as its captain, flew non-stop from Moscow to San Jacinto, California, the distance being no less than 6,305.7 miles. This flight was surpassed by that achieved by two Vickers Wellesley monoplanes flown by R.A.F. pilots, with Squadron Leader R. J. Kellett as the leader, from Ismailia, near the Suez Canal, to Port Darwin, Australia. The distance in a straight line is 7,158.653 m. The pilot of the other machine was Flt. Lt. A. N. Combe.

The next official long-distance record was 11,235.6 m. non-stop, from Perth (Australia) to Columbus (U.S.A.), set up by a Lockheed Neptune of the U.S. Navy in Sept.-Oct., 1946. The chief pilot was Cdr. T. D. Davies, and the time 55½ hrs.

There is also a numerous class of record for performances made with passengers and loads. Records of height, of distance, and duration accomplished with sailplanes are also recognized. (See Glider.) In relation to the speed and distance records, it must be realized that an aircraft's speed over the ground is not the same as its speed through the air, unless it is still air. Therefore, when a speed record is being attempted, the aircraft is flown in a series of

runs in opposite directions, and distance records (other than those made in a straight line) are officially recognized only if the flight is made in a "closed circuit." See Atlantic Flights; Australian Flights; Cape Flights.

Aircrew. Any form of screw driven by an engine which gives motion to an aircraft. It may be a tractor airscrew which is located in the front of the fuselage or wings, or it may be a pusher airscrew, that is one arranged behind the engine and to the rear of the pilot's cockpit. In its simplest form an airscrew has two blades of aerofoil section set at a fixed angle. On rotating, these blades produce a circulation of air from which motive power is derived, as explained under Screw or Marine Propeller (g.v.).

The modern type of airscrew, other than that used for light aeroplanes, incorporates a mechanism whereby the angle of the blades can be varied to obtain greater efficiency throughout the different conditions of flight. Thus when an aircraft is taking off, the airscrew blades are set at a "fine" pitch angle so that maximum power is obtained from the engine. During level flight, however, the blades are re-set to a "coarse" pitch angle. These variable pitch airscrews can be actuated so that the blades are turned with edges facing the wind in flight. This is known as "feathering" and is done when an engine fails. When an airscrew is feathered the windmill effect is eliminated so that the engine ceases to be rotated and the ill-effects of vibration and the probability of further breakage, if parts of the engine or aircraft have been damaged, are prevented. Feathering also simplifies control of a multi-engined machine when one or more motors are out of action as it eliminates drag and reduces the angle of yaw. These variable pitch airscrews may be either hydraulically or pneumatically actuated.

The constant speed airscrew is a variable pitch type of airscrew with the pitch angle of its blades controlled by a governor mechanism. The engine speed desired by pilot or engineer is maintained irrespective of changes in the speed of the aircraft, because the airscrew blade angles are automatically altered by the governor to vary the load on the engine.

An airscrew development was the contra-rotating type in which two groups of three blades turn in opposite directions. The contra-

rotating airscrew consists actually of two two-blade, three-blade, or four-blade co-axially mounted airscrews which function together. This type of airscrew eliminates the pronounced torque reaction which occurs when the orthodox airscrew is used with very powerful engines. Through the contra-rotation the slip-stream is delivered back over the fuselage and tail of the aeroplane in a balanced flow so that controllability is much improved. Greater efficiency at high altitudes is another feature of this kind of airscrew. Some of the earliest airscrews were constructed of metal but, being of primitive form, were unsatisfactory; hence the wooden airscrew was developed. Airscrews of the present day have blades made either of plastic or other bonded wood laminations or of metal, and may have from one to eight blades.

Air-Sea Rescue. The Air-Sea Rescue Service was a development introduced by Great Britain in the Second Great War. Controlled by the directorate of air safety of the Air Ministry, it was formed in May, 1941, with the primary object of saving British and Allied airmen who had been forced down to the sea and, having taken to their rubber dinghies, were in need of assistance. The service was organized jointly by the Air Ministry and the Admiralty, and the system adopted entailed the cooperation of the Coast Guard Service and the Royal National Lifeboat Institution. A constant vigil was maintained by R.A.F. pilots who searched for others who were in distress. Coastal Command long-range flying boats and landplanes flew far out over the Atlantic to aid shipwrecked men as well as air crews.

Altogether, 5,721 R.A.F. and U.S. air crew were saved by the service in the North Sea and English Channel, 1,998 of their total being Americans. Over 3,200 air crew were rescued by overseas A.S.R. units, together with 4,665 soldiers, sailors, and civilians. In the Middle East, rescues were made from the desert almost as frequently as from the sea.

July, 1943, was an exceptionally busy month, A.S.R. saving 139 members of Flying Fortress crews out of 196. The service also figured prominently in the D-day operations of June, 1944.

Numerous types of aircraft were used, including the Supermarine

Air-Sea Rescue. Airborne lifeboat floating down within reach of the crew in a dinghy such as that seen below (centre)

Walrus amphibian, Sunderland flying-boat, Westland Lysander, Lockheed Hudson, Avro Anson, Boulton Paul Defiant, Warwick, and Supermarine Spitfire. A most comprehensive equipment was introduced for this Air-Sea Rescue Service, among which were the specially devised rescue floats which were moored at many points around the British coast. These devices, brightly painted in yellow and red, were loaded with emergency food supplies, signalling apparatus, and also clothing. They were constructed with bunks and had cooking stoves.

The rescue launches, which were specially designed for the work, were for their size exceptionally seaworthy and fast. In order to defend themselves against enemy aircraft the launches were armed, guns being carried in turrets similar to those fitted to bomber aircraft. These high-speed launches cooperated with naval vessels of different classes and the work was often supplemented by trawlers and boats of the Royal National Lifeboat Institution. Airmen selected for air-sea rescue duties underwent special training.

The success of the air-sea rescue organization was due in no small measure to the ingenious devices incorporated in the equipment used in aircraft and ships.

In addition to dropping rubber dinghies to men in distress, the Air-Sea Rescue Service also dropped a lifeboat which, after release from its aircraft, descended to the water under three or more parachutes. It had two engines, sails, food, water, and medical supplies on board.

AIRSHIP: SELF-PROPELLED BALLOON

Lord Ventry, Editor of *The Airship*

The earliest effective form of mechanically propelled aircraft, the airship, has had a chequered history, though, as seen in this account by a leading protagonist, its story is by no means completed. For the early history of balloon flights see Aeronautics. See also Balloons, and under specific airship names, as Akron; Macon; Rior; Zeppelin, etc.

An airship is a lighter-than-air craft which derives its lift from gas balloons and is mechanically driven, as distinct from the free balloon, which moves under the uncontrolled forces of wind and air currents. In the heavier-than-air craft the power of flight is entirely dependent upon engine power applied on aerodynamic principles.

Airships are classed, according to their construction, as non-rigid, semi-rigid, and rigid. The first, the smallest in size, consists of a streamlined balloon with a car, provided with an engine and propeller. This class of airship was put to considerable use by the U.S. navy in the Second Great War. In the semi-rigid class there is a keel between the cars and the gas envelope. This keel distributes the weight of the car. As in the non-rigid type, crew, engines, propellers, etc., are carried in a car incorporated within the keel or suspended below it.

It is in the third class, the rigid airship, that the greatest developments have been seen. An elaborately constructed framework, or hull, curtains the lifting balloons, or gas-bags, and compartments for crew, passengers, engines, ballast, and stores are contained partly within the hull and partly in cars directly attached to the keel and faired into the hull.

On the stern of all airships are stabilising and control surfaces. Without these the airship could not be kept on a given altitude or course, nor would it have directional stability.

Early Airships

The first non-rigid to fly was the French steam-driven Giffard on Sept. 24, 1852. The first to execute a figure-of-eight and land at its starting point was the French Capt. Renard's *La France*, on Aug. 9, 1884. No further progress was possible until the arrival of the internal combustion engine. Santos-Dumont and Zeppelin were the first to use this with success.

Early airships were controlled vertically by ballast and gas valve, later by moving weights. In 1907 Capt. Voayer, of the French army, on the Lebaudy airship *Patrie*, was among the first to use elevating planes.

The net lift of an airship is the difference between the weight of the air it displaces and its own weight plus the weight of its gas. At 30 ins. barometer and 60° F. temperature, 1,000 cubic ft. of both air and hydrogen weigh about 75 lb. and 5 lb. respectively, the lift then being 70 lb. per 1,000 cubic ft. With increasing pressure, the air displaced, if the temperature remains steady, becomes heavier, hence there is a gain in lift. The opposite is true for a falling barometer. As the barometer falls about one inch per 1,000 ft. of rise, the air density is approximately one-thirtieth less, and so about one-thirtieth of the lift is lost for each 1,000-ft. climb if the ballonets are empty or the gas-bags of a rigid are full. Gases also expand and contract in volume roughly 1/500th for each 1° F. rise or fall of temperature. If both air and gas temperatures are the same, the lift will decrease or increase about 1/500th for each 1° F. rise or fall in temperature.

As an airship with empty ballonets or taut gas-bags rises, her volume remains constant, and the expanding gas is valued, i.e. released. As she is ascending into a decreasing density of air, she will lose about one-thirtieth of her lift for every 1,000 ft. With air in her ballonets, or with flabby gas-bags, her lift will remain constant provided air and gas temperatures are the same. Then the gas expands at the same rate as the weight of the displaced air decreases. Lift will be lost only when gas is valued at pressure height.

The gas superheats quicker than the surrounding air. Expansion will then be faster, and more air is displaced. So there is a false lift by the weight of this air, and this also limits the ceiling, though the larger the ballonet the greater the attainable altitude. The aluminium colour of the envelope, and flight at high speed, tend to reduce heating of the gas.

Temperature usually falls with height by some 3° F. per 1,000 ft. This lapse rate partly counteracts the expansion of the gas with height. Purity of the gas affects lift. If the purity be 90 p.c., there is a 10 p.c. loss of lift, for it is assumed that the impurity is air.

Humidity also affects lift, but to a much smaller degree. The less the humidity the greater the lift, and vice versa. Summing up, then, lift is greater on a cold, dry day than on a hot, damp day, and when gas purity is high. Besides static lift, due to their displacement, airships have a dynamic lift, due to movement. Hence large ships of many tons, heavy or light, can be flown.

NON-RIGID AND SEMI-RIGID AIRSHIPS. Non-rigid ships can be built up to sizes of about 650,000 cubic feet. The larger a non-rigid, however, the greater the internal pressure, and the heavier the envelope tends to become in proportion to the gain in lift due to increased volume.

Attempts have been made to overcome this trouble by providing the envelope with a rigid girder as a keel, from which the cars are suspended. The Lebaudy I was the first semi-rigid, making her first flight on Nov. 13, 1902. In 1905 she was bought by the French and became the first army airship in the world. In Italy and Russia this type was successful up to about 800,000 cubic ft. The shape of the envelope still depends upon the maintenance of internal pressure by the ballonets, but lower pressures are possible, and therefore lighter envelopes.

The First Great War

The Allies made great use of non-rigids and semi-rigids throughout the First Great War. France and Italy used them for bombing, but more successfully for naval purposes. Great Britain was the first to demonstrate the value of the non-rigid for anti-submarine operations. British airships flew over 2,245,000 m. during that war. Out of the thousands of convoys escorted by allied airships, only two surface craft were lost to U-boats.

For reasons of economy Britain abandoned non-rigid airships in 1921. France continued with non-rigid and semi-rigid airships up to 1937. Italy abandoned semi-rigid airships in 1928. The U.S.A., however, possessing the advantage of their non-inflammable helium gas and having a long coast line, continued to develop these ships.

RIGID AIRSHIPS. Count F. von Zeppelin (q.v.) was the pioneer of the rigid type of airship. This rigid type has a streamline frame-work hull made up of longitudinal girders and transverse frames or rings. The hull is thus

1. Airship designed and built by Henri Giffard in 1852
2. SSE 2 (1919), a non-rigid airship, at her mooring mast, Pulham, Norfolk. 3. Zeppelin L 9, an early rigid model (1915). 4. Graf Zeppelin arriving at Hanworth on a demonstration flight, Aug, 1931. 5 R34 anchored

on American soil after flying from Scotland, July, 1919. 6. Top of the mooring mast of R101, showing passengers' entrance 7 R101, completed in the autumn of 1929. 8. U.S. airship Akron, lost in a storm in April, 1933. 9. US L type of modern airship, 1939

AIRSHIP : INTERESTING AND FAMOUS TYPES FROM 1852 TO 1939

divided into bays, each containing a gas-bag with one or more valves. The whole has a fabric outer cover, leaving a space between it and the gas-bags. Inside the hull is a keel, or keels, to strengthen the ship and provide access to the various parts. The ballast and petrol tanks are concentrated in the keel. The motors are usually in separate engine cars, and a control car is built into the hull. On the stern are the usual control and stabilising planes.

The German rigids performed invaluable services as long-range scouts for their High Seas Fleet from 1914-1918. Between Jan., 1915, and April, 1918, they were used as bombing craft in 51 raids on England and Scotland. As carriers for passengers and goods the Zeppelins were unequalled. LZ1 made her first flight on Aug. 2, 1900, and from then on all the most successful rigid airships have been built upon Zeppelin lines. One or two other types of rigid airships have been produced, notably the German Schutte-Lanz, with wooden framework, and the early British ships. But none ever reached the standard of the Zeppelins.

Triumph and Disaster

It was the British R34, a copy of the German L30 class, which was the first aircraft in the world to fly east to west across the Atlantic and to make the double crossing. This was in July, 1919. Major G. H. Scott was the pilot.

In Aug., 1921, after the disaster to R38, when Air Commodore E. M. Maitland, Britain's greatest airship officer, and many of our finest airship pilots were killed, Great Britain abandoned rigid airships for Service purposes. But in 1924 the air ministry decided to construct two ships of 5,000,000 cubic ft. capacity for imperial communications. These, R100 and R101, carried out their trials during 1929 and 1930. R100, in spite of being over weight, attained a maximum speed of 83 m.p.h., then a record. She flew to Canada and back, under Major G. H. Scott and S/Ldr. R. S. Booth, in June-July, 1930. After the loss of R101 she was sold for scrap.

R101 suffered from serious lack of lift, partly because of the experimental heavy oil engines which weighed much more than was expected. She successfully weathered at a mooring mast a squall of 83 m.p.h., which is a world record. In Oct., 1930, before she had completed her

trials, an attempt was made to fly her to India. On Oct. 5 she was lost at Beauvais, Major Scott and most of the distinguished passengers and crew perishing. She was the last British airship to take the air.

Germany and U.S.A.

Meanwhile, the ban on German airships had been lifted. The first to be built was the Graf Zeppelin, of 3,708,240 cubic ft., driven mostly by Blangas. She was launched Sept., 1928, and was in continuous service until June 18, 1937. She made 148 ocean crossings, nearly all to time-table, and flew round the world, carrying a total of over 13,000 passengers.

The Hindenburg, of 8,720,000 cubic ft., was driven by engines totalling 4,400 h.p. Up to 75 passengers, plus 2 tons of mail, could be carried for 8,000 miles at a cruising speed of 78 m.p.h. This airship was commissioned in March, 1936, and made 37 ocean crossings, all to time-table, before her destruction on May 6, 1937, due to hydrogen catching fire. Thirty-six passengers were killed out of 97. They were the first fare-paying passengers to be killed in an airship. On Sept. 14, 1938, the LZ130, Graf Zeppelin II, an improved Hindenburg, was launched, but she was not heard of after Sept., 1939.

The U.S. navy laid down two new airships in 1928 as scouting units of the U.S. fleet. They were Akron and Macon. Akron (q.t.), launched Sept. 23, 1931, was caught and destroyed in a storm centre over the Atlantic on April 4, 1933, only three of her crew of 76 being saved. Macon, launched April 21, 1933, developed structural troubles. Before she could be laid up for alteration she broke up in the air Feb. 12-13, 1935, losing only two out of her crew of 83. Both ships carried four aeroplanes. At a cruising speed of 40 knots they had a range of 8,000 nautical miles, their max. speed being over 70 knots.

Goodyears later planned a 10,000,000 cubic ft. airship aircraft carrier, to carry 10 fighters and have a maximum speed of 84 knots with a range at 50 knots of 9,000 sea miles. A similar design for civil purposes would carry 100 passengers over 8,000 m. non-stop.

In the meantime the non-rigids were active. Up to Sept. 30, 1941, Goodyears' civil airships had carried 407,171 passengers and flown 4,085,244 m. without mishap to any single passenger.

The U.S. navy had about eight airships in commission in Sept., 1939. By 1945 it had over 150. These airships played a vital part in the campaign against the U-boats in American waters. Four classes were in use, the L and G for training, the operational K class of 416,000 to 425,000 cubic ft., and the M type, of 625,000 cubic ft., maximum speed over 70 m.p.h., which appeared in 1943 with a duration of over 80 hours at cruising speed. The M type ships are the largest successful non-rigids ever built.

Despite the airship's history, airship authorities consider that its story is by no means closed. In the rigid form it provided a greater payload for its horse-power and greater comfort than other forms of aircraft. In the non-rigid form it provides a valuable scouting aircraft at sea in war-time at moderate cost.

Air Sickness. An illness which sometimes develops in a person while flying. There are a number of causes such as incautious eating before or during a flight, lack of oxygen while flying in the higher altitudes, and obstructed vision. The main cause, however, is the unnatural motion which an air passenger has to endure when the aircraft is flying in rough weather or under atmospheric conditions which result in the aircraft pitching suddenly and losing and gaining height with violent movements. When an aircraft is buffeted about the changes in its flying attitude tend to upset the sensory system. The labyrinth of the ear (the inner ear) which senses yawing, pitching, and rolling movements can function only when coordination with the eyes is available and therefore if the air traveller for some reason cannot keep himself orientated by having the horizon in view, the loss of balance becomes greater and this increases any feeling of sickness.

Airspeed. The measurement of the airflow meeting an aircraft when it is in flight is called the airspeed. It has no relation to the speed at which the machine may be flying over the ground. For example, if an aircraft is flying into a 50-m.p.h. wind and the airspeed indicator carried by the machine registers 150 m.p.h., it does not indicate that the speed over the ground is 150 m.p.h. but solely that the pressure of the air which is being encountered is registered at that figure. The ground speed would be 100 m.p.h. Airspeed is shown to the pilot of

an aircraft by an indicator, the A.S.I., which is affected by the static and dynamic pressures of the atmosphere.

Airspeed. British aircraft manufacturers, with works at Portsmouth. Before the outbreak of war in 1939, the Airspeed Co. (associated with de Havillands) had produced several civil aircraft, notably the Courier, first in Britain with a retractable undercarriage, and delivered to the R.A.F. the first Oxford advanced trainer. This small twin-engined monoplane was put to a variety of uses, including training for bombing, night flying, photography, and gunnery, as well as for flying training. In 1946 appeared the Consul, a civil development, and the Ambassador (*q.v.*) was also announced. The Horsa (*q.v.*) was a glider used extensively in the Allied invasion.

Airstrip. Strip of ground affording landing and take-off facilities for aircraft. It is a temporary or emergency provision for use while a more permanent airfield (*q.v.*) is prepared. In country overgrown with bush, scrub, etc., the strip is cleared by bulldozers and levelled with graders. On a loose surface (*i.e.* in desert country) a portable metal track of strong wire netting is stretched over the strip, pulled taut, and pegged down. The

Air Training Corps. Class of eager cadets examine the guns of an R.A.F. light bomber

royal warrant dated Feb. 1, 1941. It was established to provide pre-entry training for prospective candidates for air crew and technical duties in the Royal Air Force or the Fleet Air Arm until they reached the call-up age. Enrolment was open to youths who were physically fit and were aged between 15 and 18. The whole organization of the Corps was based on that of the Air

of 1944 close on 140,000 cadets had joined the R.A.F. for both air and ground crew duties. Two-thirds of the candidates for air crew duties in the R.A.F. were members or ex-members of the Air Training Corps. The value of the Corps became apparent as its enrolment grew from year to year and it was fully appreciated by the Air Council and the Training

Badge of the A.T.C.

Commands of the R.A.F. To strengthen the cooperation which existed between the latter and the Corps, in Dec., 1943, Air Marshal Sir E. Leslie Gossage, formerly A.O.C. Balloon Command, became Chief Commandant and Director-General of the Corps, in succession to W. W. Wakefield, who was civilian director for the preceding period. In the wartime A.T.C. there were eleven Commands, including one in London, one in Scotland, one in Wales, and one in Northern Ireland. They were subdivided into Wings, Squadrons, and Flights, organized on a school and local basis, the squadrons and flights being administered, under the Air Ministry, by local committees. In 1946 the A.T.C. was reorganized under the six regional groups of Reserve Command, R.A.F., the appointment of chief commandant and director-general being abolished. *Consult The Story of the Air Training Corps*, ed. L. Taylor, 1946; *Drill Book for the A.T.C.*, 1944.

Airstrip. Transported in 25-yard rolls, strips of metal "netting" laid side by side form an admirable surface for emergency landing-grounds

Royal Navy developed an airstrip for use on water, made of linked and hinged buoyancy cans, hexagonal in shape.

Air Training Corps. Voluntary organization established by

Defence Cadet Corps which preceded it and was sponsored by the Air League of the British Empire in 1938. Before the Air Defence Cadet Corps came under the control of the Air Ministry and was

Air Transport. Before the First Great War there was no organized air transport. In the U.K. pilots were certificated by the Royal Aero Club as the British member of the *Fédération Aéronautique Internationale*, the authority controlling sporting flying. During that war civil aviation was prohibited (as it again was during the Second Great War, except under special licence from the secretary of state for Air). Because of the swift development of flying during the First Great War, completely new regulations were required after its end. Civil aviation in the U.K. was subsequently controlled by the Air Navigation Acts, 1911 and 1919, under which the air navigation directions were first published on April 30, 1919; and on May 1, 1919, civil flying in the U.K. officially began, with pilots licensed by the Air Ministry.

Control of civil aviation in the U.K. was vested in the secretary of state for Air from 1919 until the appointment of a minister of Civil Aviation in Oct., 1944, and the creation of a ministry of Civil Aviation in 1945. The Air Registration board, instituted 1937, undertook duties in respect of design, construction, and maintenance of civil aircraft. An Air Transport licensing authority was set up in 1938 to administer the system of licensing air transport organizations within the U.K.

In 1924 Imperial Airways Ltd. was formed by the amalgamation of Daimler Airways, Handley Page Transport, Instone Air Line, and British Marine Air Navigation Co. Ltd. Two earlier concerns, Air Travel & Transport Ltd. and Air Post of Banks Ltd., had ceased to operate. Imperial Airways became the sole instrument for British overseas air services until the formation of the independent British Airways in 1936. In 1939 British Overseas Airways Corporation (*q.v.*) was formed by the enforced amalgamation of Imperial Airways and British Airways into a government-owned corporation.

Railway and Shipping Companies

Air transport offers the maximum advantage over long-distance land routes and on overseas routes of any length. On short land routes the speed of air travel may not do much more than recover the time lost in getting to and from the terminal airports, which are usually sited on the fringes of the larger cities. But whenever air transport begins to save time, it competes with railway and ship-

ping interests; it is therefore natural that railway and shipping companies have sought greater interest in air transport.

During the Second Great War all internal airways in Great Britain, with the exception of Allied Airways (Gandar Dower) Ltd., were run by the "railway group," whose activities were controlled by the Associated Airways joint committee. On Feb. 23, 1944, the Cunard-White Star, the Bibby Line, and Thomas Brocklebank shipping companies were given authority to run air lines and maintain aircraft and hangars.

On Aug. 1, 1946, two further state airways corporations were formed: British European Airways, to operate all scheduled air lines within the U.K. and from the U.K. to the Continent; and British South American Airways, for the specialised routes to S. America. These were to be financed wholly out of public funds, their governing boards to be appointed by the minister of Civil Aviation. In 1949 B.S.A.A. was merged with B.O.A.C., so that all British regular air lines were in the hands of two corporations only. Private companies were permitted under the Civil Aviation Act, 1946, to carry out charter or other non-scheduled operations, and some eventually ran short air lines in association with B.E.A. Since 1949 certain civil cos. have run scheduled services in the U.K.

In the U.S.A.

Control of civil aviation in the U.S.A. is the joint responsibility of the Civil Aeronautics board and the Civil Aeronautics administration section of the department of Commerce. Early in 1942 air transport was replanned and zoned, and companies operated in subservience to the Air Transport Command of the U.S. army under their own management and with their own personnel, much as British shipping operated in the war. Pan-American Airways' pre-war monopoly of overseas services was broken by the introduction of a New York-Foynes (Eire) route flown by American Export Airlines, which also operated to Bermuda and Puerto Rico for the U.S. navy.

In July, 1945, the U.S. civil aeronautics board authorised three companies to operate U.S. world air routes for seven years, *viz.* Pan-American World Airways, to India *via* the British Isles and Cairo, and to Rome *via* Portugal; American Overseas Airlines, to Scandinavia and possibly Moscow;

Trans-World Airline to Cairo *via* Eire. American terminals are at Boston, Chicago, Detroit, New York, Philadelphia, and Washington.

Most nations at one time or other have placed their external airways operations in the hands of a monopolistic organization, *e.g.* British B.O.A.C., Pan-American Airways, Air France, German Lufthansa, Dutch K.L.M. When two nations became concerned in associated air services there were usually either reciprocal rights or the formation of a joint organization such as the former Deruluft (German-Russian Air Traffic Co.), or Hamiata, which represents a Sino-Soviet air line.

Tasman Empire Airways Ltd. was a good example of collaborative air transport. With head offices in Wellington, N.Z., it operated a mail and passenger service between Auckland and Sydney and had a tripartite capital subscription, with N.Z. National Airways holding 39 p.c. for N.Z., British Overseas Airways Corporation 38 p.c. for the U.K., and Qantas Empire Airways Ltd. 23 p.c. for Australia. In 1942 Pan-American Airways extended its San Francisco-Auckland service to Sydney. Disagreements over the Pacific service were solved when war conditions brought about a unilateral service.

After the war the International Civil Aviation Organization (I.C.A.O.) was set up to regularise such matters between governments and to arrange international safety measures (*e.g.* the weather ships stationed in the Atlantic).

In the summer of 1919 representatives of British, Dutch, Swedish, Norwegian, and Danish air transport companies met at The Hague to discuss mutual problems, a German company being coopted at the desire of the former neutrals. From this meeting emerged the International Air Traffic Association, a body which regularised problems peculiar to the working of air traffic companies. Subsequently the Air Transport Association of America was formed with similar objects within the western hemisphere. On April 16, 1945, air transport operators from 17 U.S. air lines and 20 air lines from other countries met in Havana and accepted draft articles for a world International Air Transport Association. See Air Law; Air Line; Airways; Atlantic Ferry; Atlantic Flights; Aviation, Civil.

Air Transport Auxiliary. An organization set up in the first month of the Second Great War for the purpose of delivering by air new aircraft to the Royal Air Force after they had left the factories in Britain. The pilots and ground personnel at first were all civilians, most of the former having been private flyers before the war. A proportion of these were men who were either too old for service in the R.A.F. or who were unable to reach the medical standards required by the service. In 1940 a Women's Ferry Pool was introduced, under the leadership of Miss Pauline Gower, an experienced pilot of the between-wars period. Foreign pilots were enrolled also and a number of American airmen came to Britain to take up the important work of ferrying aircraft to R.A.F. stations in all parts of the country and, later in the war, to the Middle East, Malta, and subsequently to and from the United States. Air Transport Auxiliary, which was formed by Gerard d'Erlanger, operated under the control of the Ministry of Aircraft Production. When the need for more pilots grew as the production of aircraft continued to expand it became necessary to second a number from the R.A.F. This transfer of service pilots to this civilian organization was the more urgent when the U.S.A. entered the war and the American ferry pilots were required by the U.S. Air Forces. All the pilots on entering the Air Transport Auxiliary underwent a course of instruction and the training was so thorough that ultimately women pilots who formerly had flown only light aircraft were able to ferry the fastest fighters. By Oct., 1942, these women were piloting every type of military machine, including four-engined bombers.

Air Vice-Marshal. Title of an officer of the Royal Air Force which was introduced in the service in Aug., 1919, to replace the titles of rear-admiral (if the officer had held such rank in the Royal Naval Air Service) or major-general, equivalent rank in the Royal Flying Corps and the Army. An air vice-marshal is the immediate senior in rank to an air commodore. When service dress uniform is worn this rank is signified by a broad braid ring surmounted by a narrow braid ring on the sleeves of the tunic and on the shoulder straps of the greatcoat. The equivalent rank in the W.R.A.F. is Air Chief Commandant.

AIR WARFARE FROM 1914 TO 1945

Captain Norman Macmillan, M.C., A.F.C.

Telling how the nations, particularly Great Britain, developed, organized, and deployed the air weapon. As an account of the strategic use of Air Power, this article is corollary to the one given under that heading. Tactics are explained under Air Fighting. See also Air Defence; Air Raids; Luftwaffe; Royal Air Force, etc.

Air warfare can be said to have begun in 1914 when reconnaissance by aeroplanes of the Royal Flying Corps was largely responsible for the successful retreat of the B.E.F. from Mons. Although fighting between aircraft began in an elementary fashion before the end of 1914, air warfare during the First Great War was regarded primarily from the aspects of reconnaissance and direction of artillery fire.

The main object of fighter aircraft was then to clear the sky for the activities of artillery observation (now called bombardment control) and reconnaissance aircraft; this was accomplished partly by the provision of fighter escorts, but mostly by dispatching fighter patrols to wage constant war upon enemy fighters.

Early Formations

It appears to have been Lord Kitchener who first foresaw the need for aircraft to fly in formation for war purposes. In Nov., 1914, he gave orders to the Directorate of Military Aeronautics that flying in formation was to be practised. Before the end of 1916 flights flew in formation, and in 1918 large formations of several squadrons were seen in France.

Night-flying aeroplanes were introduced early in the First Great War under the compelling influence of the Zeppelin raids, and night bombers were used by the R.F.C. in France from the winter of 1916-17 onwards. No blind-flying instruments were then invented; all night-flying aircraft flew singly, and only when weather permitted some visual observation of the nocturnal landscape.

Day bombers operated in formations. Their radius of attack (about 120 miles) exceeded that of contemporaneous fighters, which were unable to escort the bombers all the way to and from their targets. Fighters first carried bombs (four 20-pounders) in the summer of 1918.

Throughout the First Great War aircraft were seldom able to make a major contribution to the fire-power volume of the surface forces, and the total weight of bombs dropped by the British air forces during the whole of the

1914-18 war (7,945 tons) was less than that dropped by the Allied air forces in Europe in a single day during the closing stages of the Second Great War with Germany.

One exception certainly occurred in the Palestine campaign, when the air forces under Allenby wrought havoc among the retreating Turkish troops at Megiddo.

Naval aircraft were concerned mostly with anti-submarine patrols and reconnaissance over the North Sea to keep watch over movements of German surface warships and submarines. Some naval squadrons cooperated with the B.E.F. Others undertook small-scale strategic bombing attacks. A few ships were sunk by airborne torpedoes.

The German air forces were used in a similar manner, but the geographical situation enabled them to attack London (and other towns) with naval and army Zeppelins and aeroplanes. Berlin was never bombed during the First Great War, but at the armistice a special squadron was at readiness to bomb the German capital, using Handley Page V/1500 four-engined bombers.

Most aeroplanes flew in the First Great War without radio, but artillery observation aircraft used W/T. Before the war ended, operational flying at about 20,000 ft. had become possible, and oxygen equipment and electrically heated clothing were available. Static line parachutes were used by observers in kite balloons, but there were no parachutes for aircraft crews.

Between the Wars

During the interval between the First and Second Great Wars the technical progress of air warfare outstripped the operational. Aircraft developed greater range and load-carrying capacity, faster speed, greater fire-power, higher ceiling; blind-flying instruments, parachutes, better bomb-sights and gun-sights were produced; bombs became larger; aircraft were more reliable; radio telephone communication between aircraft and aircraft, and air and ground came into use; the monoplane displaced the biplane. Staff control over operations

was improved. Aircraft were directed from operations rooms which became the "brains" of air warfare. Radar was added to the other means of intelligence used to counter enemy action. Functional R.A.F. Commands (Bomber, Fighter, Coastal) replaced the mixed brigades of the First Great War and the subsequent peace-time organization of Air Defence of Great Britain, Inland Area and Coastal Area. In 1938 the Fleet Air Arm was restored to the complete control of the Admiralty.

When the Second Great War began the greatest technical and operational advances had been made in the command dealing with fighter defence. This is understandable, for its procedure was a direct development of First Great War fighter strategy and tactics, and this could not be said of the work of the other commands to an equivalent degree. To that happy circumstance must be attributed part of the success of Fighter Command over the Luftwaffe in the Battle of Britain.

Tactical Air Force

The tactical air force was evolved during the military operations of the British 8th army in North Africa. It was the underlying principle of that successful campaign that the air battle must be won first. When air supremacy was established, the unfettered air force could be used to disorganize the enemy surface forces. The tactical air force was commanded by specialist air officers. Army and air staffs worked to a common plan under one sole commander-in-chief.

The same principle was followed after General Eisenhower became supreme commander of the Allied armies in N. Africa. It was maintained during the crossing of the Mediterranean *via* Sicily, and during the invasion of Italy. It was elaborated in the later stages of the Second Great War in Europe because larger forces were committed after the invasion of Normandy, and several tactical air forces were engaged, over whom there was no over-all air commander. Instead, a senior air officer became deputy supreme commander.

The strength relationship was never so exactly planned in any previous campaign. The nearest example may have been in the combined strokes of the Wehrmacht and Luftwaffe in the battles of 1939-41.

During the course of the Second Great War, R.A.F. squadron personnel and aircraft became fully mobile while station (and other ground) personnel remained relatively static. This use of mobile tactical squadrons supported by static ground echelons enabled the various functional commands to overlap their operations within the same geographical zones as conditions demanded without interfering with efficiency.

To ensure mobility of tactical units airfield servicing commandos were organized; these advanced with the leading elements of the army to select and prepare airfield sites into which air squadrons could move to maintain close support for the infantry and armour.

Transport aircraft were used to bring up petrol and other supplies. Airfield defence became important, leading to the formation of the R.A.F. Regiment, with both Field and A.A. Squadrons.

During the attack on the Rhine, 2nd T.A.F. squadrons operated from airfields in Holland, Belgium, France, and the U.K. The U.S.A. 9th A.F. had previously moved from the U.K. to the Continent in support of the American armies. So had the Army air observation post squadrons, which in the Second Great War conducted the battery shoots that had been directed in the First Great War by R.F.C. and R.A.F. Army Co-operation squadrons. Among the mobile components of air warfare the Glider Pilot Regiment was concerned with special surface operations whenever an additional weight of attack was necessary to assist the army to break through difficult territory, or to contain an enemy force; its pilots were partly Army and partly R.A.F. personnel, while its tug aircraft were flown by an R.A.F. group. The Special Air Service was an extension of this process into the realm of infiltration of small parties from overhead far behind the enemy lines. Transport Command was ubiquitous, flying wherever its carrying capacity was required.

Other Air Commands

Fighter Command, Coastal Command, R.A.F. Bomber Command, and the U.S.A. 8th A.F. maintained fixed headquarters in the U.K. throughout the war.

Fighter Command aircraft undertook offensive sweeps over the Continent and the seas around the U.K. to combat enemy aircraft by

day and night. Coastal Command swept the oceans and sea-lanes in continuous anti-U-boat warfare. Convoys were further protected when at sea by ship-borne aircraft carried in merchant ships and warships fitted with catapults, and in aircraft carriers of the Fleet, Escort, and Merchant ship types. All marine air operations by British aircraft, whether shore-based or ship-borne, together with the naval operations of the Fleet Air Arm, came under the operational control of the British Admiralty. In the Western Hemisphere U.S. Naval Air Corps and R.C.A.F. aircraft collaborated under the U.S.N. and R.C.N. The S.A.A.F. operated from its own territory.

Bomber Command and the U.S.A. 8th A.F. were the two great strategic air commands of the Second Great War in Europe, but the smaller and important U.S.A. 15th A.F. based in North Africa and later in Italy must not be forgotten. These air forces were primarily responsible for conducting strategic war against German industry, oil, and communications. In the Far East the U.S. 20th and 21st A.F. maintained a similar campaign against Japanese industry. The work of all strategic air forces was greatly indebted to the photographic reconnaissance units that secured target evidence.

Softening Up

Aircraft were employed to "soften up" enemy surface positions before Allied ground attack forces went in. Road and railway bridges across rivers were brought down so that the enemy forces within any selected area became isolated and difficult to reinforce. Railway trains and road convoys were sought by day and night and destroyed or damaged by "interdiction" aircraft detailed to interrupt the enemy supply programme. River, canal, and coastal waterborne traffic was cut by both tactical and strategic aircraft, the latter using bombs up to 22,000 lb. for this purpose. Where necessary, "choke-points" were created by the demolition of buildings (or even towns) that would obstruct road and rail junctions, sometimes by day bombers and sometimes by night bombers. In these duties both tactical and strategic operations were interwoven by the deputy supreme commander controlling the air components.

The immense speed-up in air warfare demanded improvements

in communications. Air staffs used landline telephones, teleprinters, W/T and R/T radio, radar, dispatch riders, and within local stations, necessarily widely dispersed against bombing, loud-speaker linkage. Ground communication with aircraft, normally effected by controllers using R/T, was carried into the forward army zone by army and air force personnel in mobile vehicles equipped with R/T and called Visual Control Posts. Thence aircraft flying over advanced army elements were directed on to targets which required immediate attention from overhead fire-power.

In the Far East, during the last nine months of the war, Superfortress bombers in fleets up to 800, dropped record loads of 6,000 tons, though operating under conditions involving turn-round flights of about 3,000 m. There too, the U.S. Third Fleet, which included British warships and aircraft carriers, dwarfed all previous marine

air efforts by more than once deploying 1,250 aircraft over Japan in a single day's strike, in the proportion of about four U.S. aircraft to one British.

Many operations in air warfare, particularly strategic bombing, must affect the citizens of a nation. Three-dimensional warfare acknowledges no boundary between military and civilian property or personnel within its target area. When strategic bombing is used as a weapon of blockade civilian life and property cannot be immune from its destructive effect. It is therefore clear that this development in war more than any other brought into being the national condition known as total war.

The discovery of the means to employ atomic energy in bombs (see Atomic Bomb) created a situation unprecedented in the world's history, and this development in air warfare opened an epoch which can lead to total peace, with total destruction as the alternative.

same time barred such development to Germany, Italy and, by the misfortune of war, to France.

The post-war era therefore began with the transoceanic airways almost exclusively in the hands of U.S. and British interests, with the U.S. preponderating in the Pacific and to a lesser extent in the South Atlantic, but with Britain similarly well situated in the North Atlantic zone.

More Powerful Aircraft

The improvements in aero-engines (*q.v.*) resulting from unlimited war expenditure between 1939 and 1945 made possible the construction of much larger transoceanic aircraft. In 1939 the largest of these aircraft (the Boeing Clipper) weighed 37½ tons. In 1943 the weight had risen to 70 tons (the Martin Mars), and in the same year new designs were in hand for aircraft weighing up to the 111½-ton Bristol 167. In the same period engine power rose from units varying between 1,000 and 1,500 h.p. to units producing from 2,200 to 3,500 h.p.

Advances in the power produced by engines at great heights and the introduction of pressurised cabins made it possible to operate at more economical atmospheric levels without this causing any discomfort to passengers.

In 1939 not more than nine passengers per flight could normally be transported across the Atlantic at a cruising speed of about 190 m.p.h. The Bristol 167 design current before the Second Great War ended made provision for a load of 72 passengers to be carried over the same route at a speed 60 m.p.h. faster.

INTERCONTINENTAL AIRWAYS.

These fly between the different units of the eastern and western hemisphere land masses, but do not connect the two hemispheres. In the western hemisphere air routes link North and South America, traversing the isthmus and islands of Central America on the way. On these routes it is possible to travel from Nome in Alaska to Santiago in Chile, from Montreal in Canada to Buenos Aires in Argentina. The western and eastern routes follow their own seaboard, in two fluctuatingly parallel lines, inter-connecting all the principal cities of the western hemisphere between the Arctic and Antarctic oceans by their direct and transverse connecting lines. The trunk lines are mainly owned by the U.S.A.

Aircraft of shorter range than those in the transoceanic group

AIRWAYS OF THE WORLD

Captain Norman Macmillan, M.C., A.F.C.

A survey of the four main kinds of air route and the varying problems involved in their organization and maintenance. See also under Air Law; Air Transport; Aviation, Civil. See plates showing World and European Airways

Airways of the world may be classified in four main groups: (1) transoceanic; (2) intercontinental; (3) continental; (4) national. Each group calls for differences in aircraft, servicing organization, and personnel. Each group may differ from any other group in respect of the legal codes under which it must operate and to which it must conform; these considerations are dealt with under Air Law. Here the routing and technical organization of the airways of the world are described.

TRANSOCEANIC AIRWAYS. These are routed to interconnect continental land masses separated by water, with their terminal points sited to give rapid connexion between the great centres of government, finance, and industry (and therefore population). They cannot be regarded wholly from a commercial aspect, but must be considered in varying degree as of politico-strategic and politico-economic importance. They are, without exception, government-controlled, whether operated by state air lines or by chosen instruments of a public or private financial structure. In each case transoceanic air routing is a matter for intergovernmental

arrangement between the terminal states concerned.

The land masses of Western Europe and North America have produced the principal seafaring peoples since the introduction of mechanical propulsion to ships, and it is the states of the same land areas who have pioneered the transoceanic airways.

Atlantic and Pacific

Transoceanic airways span the Atlantic and Pacific Oceans to interconnect Europe, Africa, Asia, and Australasia with North and South America, and include the Tasman Sea crossing. Before the Second Great War the U.S.A. operated trans-Atlantic and trans-Pacific airways and Great Britain operated experimental trans-Atlantic airways. But the earliest of all transoceanic airways were the French-pioneered routes across the South Atlantic between French West Africa and Brazil, a route whereon Germany operated at a later date, and in which Italy was accumulating a growing interest. Russia experimentally pioneered a trans-Arctic route from Moscow to San Francisco. The Second Great War gave great impetus to Anglo-American development of all oceanic airways, and at the

are suitable for use in intercontinental flights, and the conditions of service make it possible to increase the number of intermediate passengers and goods, with a correspondingly lower percentage of through travellers.

Politico-Strategic Problem

In the eastern hemisphere intercontinental airways connect Europe, Africa, Asia, and Australasia. They include over-water crossings up to some 500 m. in length. The British, French, Dutch, Belgians, Italians, Germans, Russians, Australians, and Japanese were all operators of airways in this group before the Second Great War. The U.S. entered it during the Second Great War, and expressed her intention of remaining in it. Owing to the politico-strategic importance of many of the airways in this group victorious Powers may impose conditions for the operation of these airways with which vanquished Powers will be forced to comply. Within this group of airways should come the greatest technical developments, for all types of long-haul and short-haul heavy and medium commercial aircraft will be employed, and these airways will have the strategic military importance possessed by railways since the middle of the Victorian era, particularly in regard to the siting and ownership of aerodromes.

CONTINENTAL AIRWAYS. These are of two classes: those which, although continental in character, as in the U.S.A., Russia, and Australia, are yet national, and those which are truly continental, as in Europe. The difference is mainly brought about by the complications in the second class of multiplied languages, customs clearances, currency rates of exchange, restrictions upon the carriage by foreign aircraft of nationals within their own states, and variations in juridical conditions, all of which exist in their greatest aggregate within Europe. It has been therefore necessary to create conventions to which the numerous states can subscribe, so that differences can be smoothed out into something like a semblance of uniformity. (See Air Law.) In America, Russia, or Australia, continental airways can be legitimatised on a federal basis. Similar advantages apply within states of lesser areas only when airways are restricted to a national basis. This difference must, in varying degree, affect the relative

development of airways by competitive nations.

Continental airways, like railways, are almost exclusively concerned with the linking of the principal cities within a particular zone of the earth's land surface. They are generally flown by medium-range aircraft, carrying from 14 to 40 passengers at speeds of 200 to 300 m.p.h. on a basis of fair frequency of service.

Control of Routing

Airways in this group are more crowded than those so far considered, and it is therefore essential that strict measures of flying control be maintained over the routing, height of flight, and approach to airport of the aircraft engaged on the services.

Abyssinia and the Union of South Africa have the status of sovereign Powers in regard to air routes and services within their territory. Nevertheless, because much African administration is the colonial prerogative of a number of European states, special international problems arise in regard to the operation of airways in Africa, e.g. the *a priori* claim of the U.S.A. to continue the flying rights in Africa granted to her during the Second Great War.

NATIONAL AIRWAYS. These can be organized with the greatest freedom, e.g. internal airways were quickly organized within the Weimar republic of Germany in 1918-19. Such airways are free from customs difficulties and language problems. They operate under one law, and passengers require no passports. States like the U.S.A. and U.S.S.R., with great aggregates of territory and population, possess the geographical conditions wherein the maximum benefit can be obtained from national airways. But excessive concentration upon internal airways excludes a state from some of the benefits of international air traffic. Thus, in the interrelationship of national and international airways, states are faced with an air traffic problem similar to the commercial problem of free trade v. tariff reform, and the further development of the airways of the world must depend upon the manner in which this problem is resolved.

Airy, Sir George Biddell (1801-92). British astronomer. Born at Alnwick, Northumberland, July 27, 1801, and educated at Cambridge, where he was senior wrangler in 1823, he became a fellow of Trinity and Plumian

professor of astronomy. In 1825 he was appointed director of the astronomical observatory at Cambridge.

Sir George B. Airy,
British astronomer

In 1835 he became Astronomer Royal. His practical abilities found scope in his device for the telegraphic distribution of exact time. One of his most important achievements was the establishment of a mechanical device, whereby the disturbance of the compass in iron-built vessels could be rectified. He resigned in 1881, and died Jan. 2, 1892.

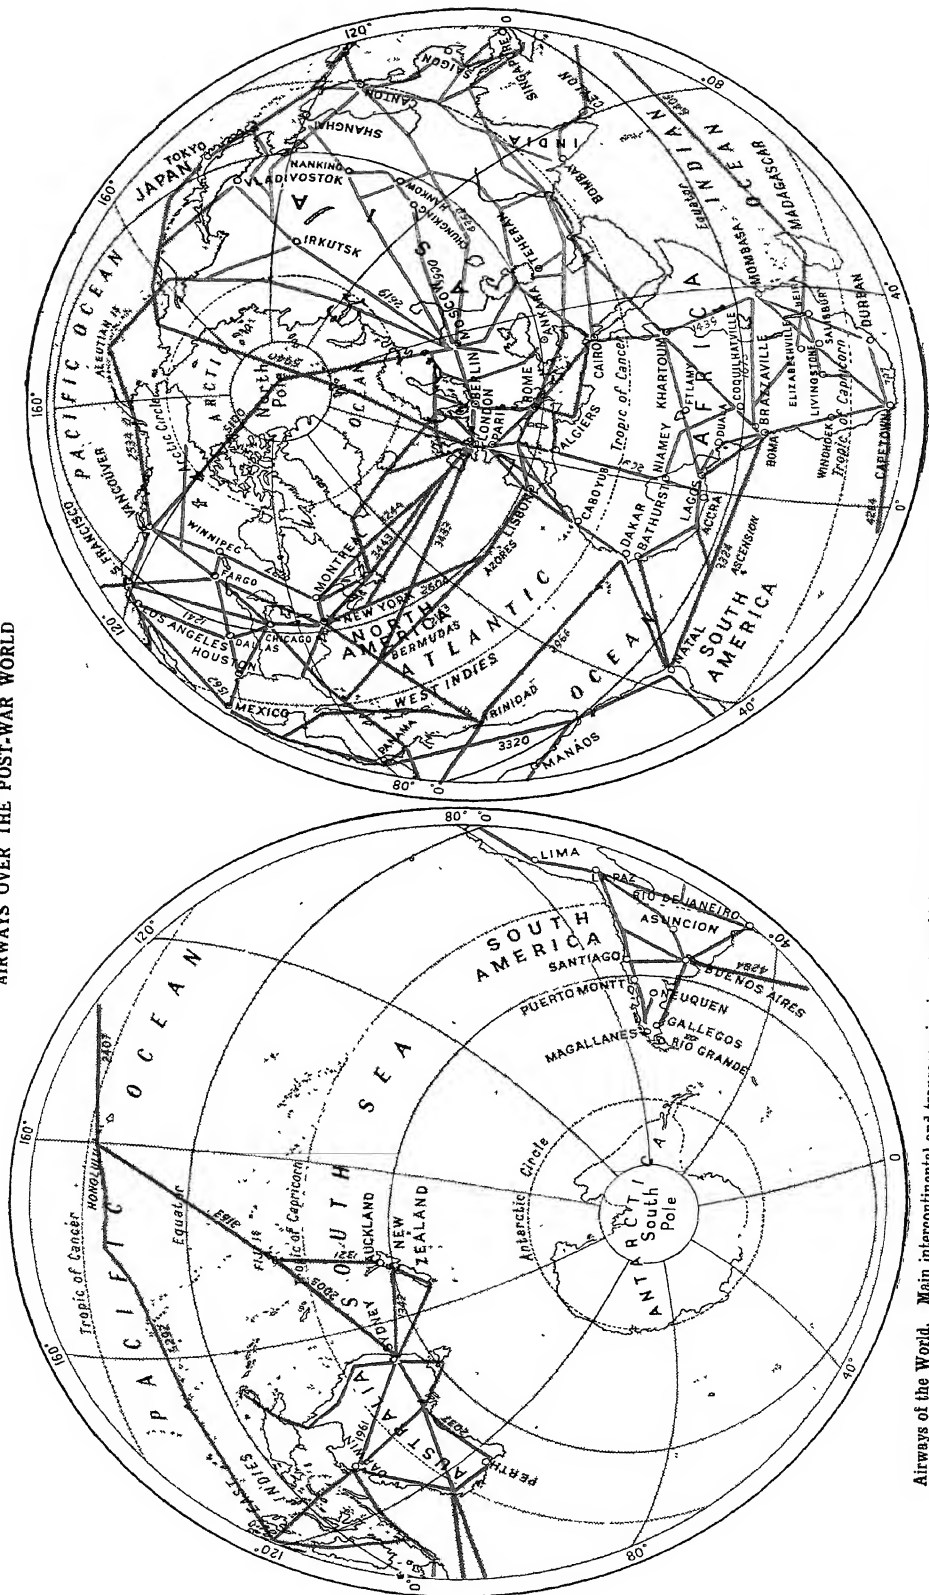

Aislabe, John (1670-1742). English politician. Born at York late in 1670, he became member of parliament for Ripon in right of his possession of the Studley Royal estates. He was treasurer of the navy in 1714 and chancellor of the exchequer under Sunderland in 1718. He strongly supported the scheme to pay off the national debt which became known as the South Sea Bubble (*q.v.*). On its collapse he resigned office early in 1721 and, being found guilty of "most notorious, dangerous, and infamous corruption," was committed to the Tower. After being released, he retired to his Yorkshire estates, the motion for confiscation of these having been rescinded.

Aisle (Lat. *ala*, wing). Portion of a church extending on one or both sides of the choir or nave, from which it is divided by columns and arches. The transepts of large churches, such as York Minster, are furnished with aisles. The Roman basilica of the larger type was divided by columns into nave and aisles, and has served as a model for Christian churches. *Pron. ilc.*

Aisne. River of France. Rising in the Meuse department, it flows W. and joins the Oise near Compiègne. Connected with the Meuse and Marne by canals, it is navigable for rather more than half its length of 175 m.

Aisne. Frontier department of N.E. France. Watered by the Aisne, Oise, and Marne, with other navigable rivers and canals, its area is 2,866 sq.m. Generally level, except to the S., the soil is fertile, producing sugar beet and wheat, with potatoes, flax, hops, and hemp: cider and wine are made, and chemical, sugar, and other industries are carried on. The capital is Laon, and Soissons is one of the chief towns. Pop. 484,647.

AIRWAYS OVER THE POST-WAR WORLD

Airways of the World. Main intercontinental and transoceanic air routes which will be used in post-war aviation. The distances between the air stations are given in statute miles

AISNE : THE BATTLES OF 1914-18

Major battles of both the First and the Second Great Wars are described in detail in this Encyclopedia (see Julland; Somme; Ypres, etc.). This article deals with the three Aisne battles of Sept., 1914; April-May, 1917; May-June, 1918

The first battle of the Aisne was fought on a front running E.S.E. for 100 miles from Compiègne to Tahure, E. of Reims, between four German armies and four French armies together with Sir John French's British army. Both sides had just fought the battle of the Marne; and as the Germans had been driven back 40 m. on the W. section of their front, there was reasonable hope that they might be forced to make a much more extensive retreat. But the Germans, while marching S., had begun entrenchments on the plateau between Soissons and Craonne, N. of the Aisne. When they fell back from the Marne, these were hastily pressed forward, peasants and prisoners being compelled to work on them, so that a great fortified system was created. Moreover, the Germans had crushing superiority in heavy artillery and a great advantage in machine-guns. Numerical superiority in aircraft was less important because of uniformly bad weather.

The First Battle

The Allies reached the Aisne at the W. end of their line on Sept. 12. Reims was reoccupied the following day, when the river was crossed at many points. But for the most part the Allies could make no further progress, being confronted by heavy machine-gun and artillery fire from the enemy's strong positions. By Sept. 14 they realized that the Germans intended to make a stand. Troops of the 6th French army had pushed forward

during the night and had come near the crest of the plateau, but could make no further headway. On Sept. 15 the British 1st corps gained a local success in a rapid advance towards the plateau and the Chemin des Dames, the great road that runs along its summit, and reached a point close to Troyon. It was known later that they had confronted a gap in the German line, but the 15,000 tired men were too few to press home the advantage. Yet they obtained a firm footing on the upland, and inflicted heavy losses. Though German reinforcements, counter-attacking, stopped further progress, the line gained by the British was held thereafter for the next three years without marked change.

German counter-attacks continued during the following days, and the Allies were slowly forced back from positions they had gained. Sept. 17 saw the beginning of a French attempt to turn the German right flank, an attempt that was unsuccessful because the Germans extended their flank as fast as it was threatened. The British 1st corps beat back a considerable counter-attack, and in following up managed to cross the Chemin des Dames, reaching Cerny, N. of Troyon. But this proved to be the high-water mark of the Allied advance, for Cerny could not be held.

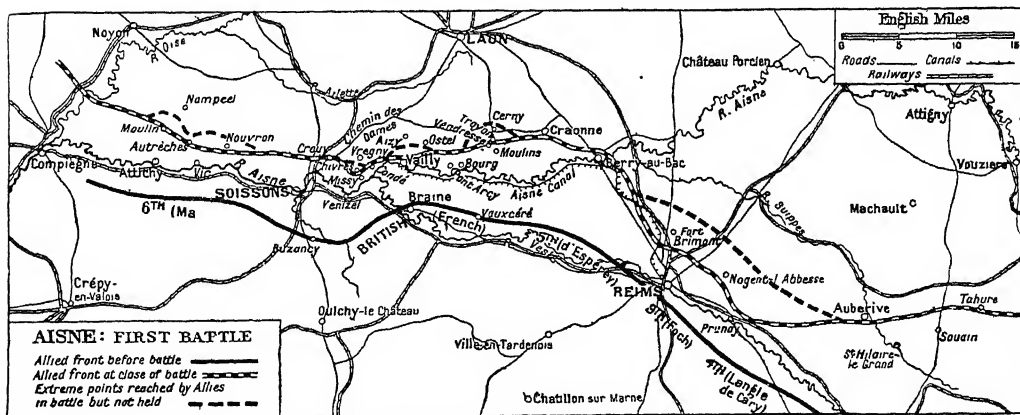

The French 9th army N. of Reims was next counter-attacked. The Germans recaptured a height near Reims which gave them good

observation of that city, which they immediately began to bombard. Positions dominating Reims remained in German hands for four years. Germans attacked again at intervals at various points during Sept. 19 and 20, but with no effect. The battle had now degenerated into trench warfare, with both armies under cover and no possibility of further decisive movement. The failure of a determined German effort a week later (Sept. 27-28) to capture the British position near Troyon virtually marked the end of the battle.

The result was a disappointment to the Allies. British losses were over 13,500, more than one-fifth of the total force engaged: French and German casualties were on the same scale. But the Germans were left firmly entrenched across the very heart of France. Their Aisne positions remained intact almost to the end of the war.

The Second Battle

When the second battle of the Aisne opened in April, 1917, the situation had been slightly changed: first by a German local success in 1915 which had given the German army a narrow strip on the S. bank from Missy to Chavonne, then by the Allied gain of ground N. and E. of Soissons during the German retreat in early 1917, which carried the Allied front to near Laffaux and Vregny, and left a sharp German salient projecting south. The German positions were by this time extraordinarily strong, the trenches being provided with deep concrete dug-outs, while machine-gun posts of steel and reinforced concrete were everywhere. Numerous limestone caves

Aisne. Plan of the positions of the Allied forces during the first battle

Aisne from time to time, the whole of the heights of the Chemin des Dames was in French hands by the beginning of Nov., 1917. They were lost again in the third battle of the Aisne, May 27–June 18, 1918.

The Third Battle

The Germans' Aisne offensive of 1918 followed their two offensives towards Amiens and the Channel ports in March and April respectively. They were in high spirits at their successes, and Hindenburg had publicly declared that the war was over and won. British reserves from Great Britain totalling 350,000, and the 200,000 American troops embarked for Europe, were not yet available in the field, so that everything depended on the capacity of the battered Allied armies already in France to hold off the Germans until these reinforcements could be thrown in.

The strategic position of the Germans enabled them to mass their own reserves in the centre of a semi-circle near Cambrai, while the Allies had to move their troops on exterior lines. On the Aisne front the Germans had two armies ready to attack, with a total of 28 divisions of specially trained troops for the first onslaught and 13 divisions in reserve. They were disposed between Anizy-le-Château and Reims, on a front of over 30 m. The Allied force facing them consisted, on the left, of two French divisions in the line, holding the Chemin des Dames as far E. as Craonne, and two in reserve; three British divisions (50th, 8th, 21st) in the line from Craonne to Berméricourt, with another (25th) in reserve; on the right, the 5th French army, holding the positions round Reims—a total of only eight divisions and one army to confront 41 divisions.

The Germans opened a terrific bombardment of the front at 1 a.m. on May 27, and their infantry attacked two hours later. The four French divisions were quickly forced back from the Chemin des

Dames by sheer weight, the Allied centre was broken, and the Germans streamed through to the Aisne, which they crossed at Vailly and other points. By dusk troops of their right had also crossed the river Vesle, W. of Fismes, after an advance of over 10 m. unparalleled in their previous offensives. Eastward from Craonne, the British 50th division offered stout resistance and did not fall back until its left flank was uncovered by the retreat of the French. The 21st, from Cormicy to Berméricourt, stubbornly held its position, though all touch with headquarters was lost for 24 hours. By evening the British front ran from near Fismes, through Cormicy, to Berméricourt.

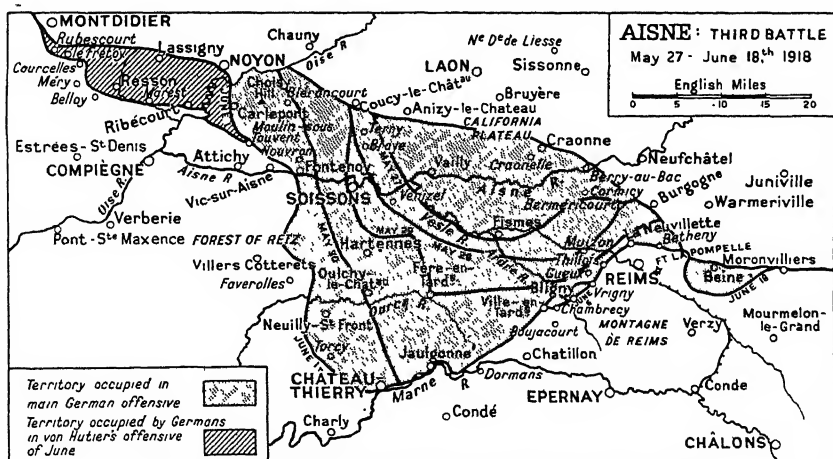

On May 28 the German attacks were renewed by fresh divisions, and their salient was widened and deepened in the direction of Paris. The French were forced back from Terny, Braye, and Venizel, and Soissons was shelled with terrible effect. In the centre the Germans reached a line midway between the Aisne and the Marne. In the E. the British had to continue their retreat to maintain contact with the French, and were driven back across the Vesle towards the Ardre valley. Soissons fell on May 29, when the German advance was extended southwards towards the Marne, reaching Fère-en-Tardenois, only 8 m. from that river. The British were pushed from their positions near Reims as far as La Neuville, under 2½ m. from the city. Reims was bombarded and the troops there were in danger of envelopment.

The Marne was reached on May 30, at Jaulgonne and to the

immediate E., and the Germans gained important ground N.W. and S.W. of Soissons which enabled them to use the rly. junction there, thus gaining increased power of manoeuvre. On the Marne they commanded and rendered useless the main rly. from Paris to Épernay and Reims. They also reached Betheny, 1½ m. N.E. of Reims, though failing in an effort to carry further the threat of encirclement. On May 31 they strove to extend W. in the direction of Paris, gaining a position on the heights N. of Château-Thierry.

At this point, just as decisive victory seemed within the German grasp, the violence of the attack suddenly died away. Though the Germans made further small gains, they did not add greatly to their total capture of 50,000 prisoners and 650 guns. French reserves were arriving in strength and resistance was stiffening. On June 1, Fort la Pompelle, 5 m. S.E. of Reims, was both lost and regained by the French, and on the N.W. part of the battle-front a hill near Noyon changed hands four times, ultimately resting with the French. On June 2 a great German assault W. of Reims was shattered by the French; and British divisions holding positions E. of Ville-en-Tardenois, from Aubilly to Boujancourt, earned high praise from the French command by beating off all attacks. German troops penetrating the outskirts of Château-Thierry were also thrown back.

On June 3 the Germans, attempting to advance along the N. bank of the Ourcq and to work into the forest of Villers Cotterets,

Aisne. Map of territory occupied by the Germans in the third battle

encountered American troops, who speedily proved their quality by counter-attacking at Veully-la-Poterie and driving back the Germans in confusion. American and French troops also drove back a German battalion that had crossed the Marne at Jaulgonne. Americans attacked again on June 5 and 6 near Torcy, N.W. of Château-Thierry, and in conjunction with the French, drove the Germans back a mile. The Germans stormed Bligny in the morning of June 6, but the ruins were recovered by the British in the evening.

The failure of the Germans' efforts to widen their flanks brought their offensive to a close. It had secured greater results than their two earlier 1918 offensives, having carried their front to a point only 40 m. from Paris. They had made immense captures. But their primary aim, which was to inflict decisive defeat on the French army, had not been attained; and their own losses in the offensive reached 150,000. The Allied losses, though serious, could be replaced from the American army, such an inexhaustible source as the Germans could not draw upon.

The Aisne was finally cleared of Germans during the last great Allied offensive in early Oct., 1918.

Aissé, MADemoiselle (c. 1694-1733). Circassian letter-writer. The daughter of a chief whose home was pillaged while she was a child, she was sold to the Comte de Ferriol, French ambassador at Constantinople, who sent her to the household of his sister-in-law at Paris. There her history and beauty combined to win her great popularity, and Philip, duke of Orleans, courted her openly. She gave life-long affection, however, to the Chevalier d'Aydie, by whom she had a daughter. In her letters to Madame Calandrini are some shrewd portraits of people of the period. Aissé died March 13, 1733, and her letters were edited by Voltaire in 1787. Her name is a corruption of Haïdée, and her story probably suggested to Dumas the character of that name in *The Count of Monte Cristo*.

Aistulf or **ASTOLF** (d. 756). King of the Lombards. He succeeded his brother Rachis in 748; in 750 Ravenna was in his hands and he marched on Rome. The pope, failing to obtain help from the emperor Constantine V, appealed in person to the Frank mayor of the palace, Pippin, or Pepin, whom he anointed king

of the Franks. In 753 Pippin defeated Aistulf and made him promise to give up the captured territory. Aistulf broke this promise and besieged Rome. Pippin again defeated him, and Ravenna and part of the exarchate passed from the Lombards to the popes.

Aitchison, CRAIGIE MASON ATTCHISON, LORD (1882-1941). Scottish judge. He was born Jan. 26, 1882, and educated at Falkirk High School and Edinburgh University, winning the Murhead prize in civil law. Called to the Bar in 1907, he became a K.C. in 1923. One of his successes as counsel was obtaining in 1929 the annulment of the verdict of murder against Oscar Slater (*q.v.*), passed 20 years earlier. Having entered Parliament in the same year as Labour member for Kilmarnock Burghs, he became lord advocate for Scotland, and continued to hold that office when the National Government was formed in 1931, until in 1933 he became Lord Justice Clerk. He served on the Scottish educational committee of the Privy Council. He died at Edinburgh, May 2, 1941.

Aitken, ROBERT GRANT (b. 1864). American astronomer. Born in California, Dec. 31, 1864, he studied astronomy at Williams College, Massachusetts, became a professor at the College of the Pacific, and in 1895 went as assistant to Lick Observatory, of which he became director, 1930-1935. His outstanding work was the discovery of over 3,000 double stars and the calculation of their orbits and those of many comets. He was awarded the gold medal of the Royal Astronomical Society in 1932.

Aiton, WILLIAM (1731-93). British botanist. Born in Lanarkshire and brought up as a gardener, he was appointed assistant at the Botanic Garden at Chelsea and in 1759 to the management of that at Kew. He remained there for the rest of his life, also looking after the royal pleasure gardens at Richmond, and died Feb. 2, 1793. Aiton spent sixteen years on his *Hortus Kewensis*, a catalogue of the plants at Kew, the variety of which he had done much to increase; this was published in 1789. His eldest son, William Townsend Aiton (1766-1849), succeeded to the posts at Kew and Richmond and carried out work for George IV at Windsor and Brighton. He brought out a second edition of the catalogue

and helped to found the Royal Horticultural Society.

Aitutaki or **AILUTAKI**. One of the Cook Islands, in the Pacific Ocean. Discovered by Captain Cook in 1777, it is 9 m. long and 21 m. in circumference. With a few islets, all surrounded by a coral reef, the whole encloses a lagoon, which was once surveyed for the purpose of making a naval station. Coconut palms abound.

Aix. French islet off the coast of the department of Charente-Inférieure. Two miles from land, it is 3½ m. long by 1½ m. wide.

Aix. City of France, known as Aix-en-Provence. It is in the department of Bouches-du-Rhône, 18 m. by rly. N. of Marseilles. The seat of an archbishop, the cathedral dates from the 11th century. The university, founded in 1409, is now incorporated with that of Marseilles. The city has a large library, technical colleges, schools, museums, law courts, a 17th century town hall, and natural fountains. It trades in oil, wine, flour, and almonds. The ancient *Aquae Sextiae* (Springs of Sextius), Aix grew up round warm mineral springs where were baths built by the Roman consul Sextius Calvinus in 123 B.C. It was the former capital of Provence, and was famous in the days of King René (1409-80). The Marquis d'Argens (*q.v.*), the philosophical writer, was born at Aix, and Mirabeau was its deputy at the time of the Revolution. Pop. 46,053.

Aix-la-Chapelle (Ger. Aachen). French and more familiar name of a German city close to the frontiers of Holland and Belgium, 45 m. by rly. W. of Cologne. The large central rly. station was familiar to European travellers as a frontier station. For over a thousand years the city was a centre of West European culture and learning. In modern times it became a manufacturing centre. In the Second Great War its strategic position and its proximity to the Siegfried Line made it an important centre of war industry, and its capture by the U.S. 1st army in Oct., 1944, represented the first major Allied success on German soil. The city was largely destroyed in the process.

Before the Second Great War its two most notable buildings were the cathedral and the town hall. The former was built by Charlemagne A.D. 796-804, on the site of an earlier church, and was added to in 983 by Otto III. Parts of this old building remain, but the choir and chapels date from the 14th and 15th centuries. Some marble

and granite columns which were brought from Italy, and the bronze west doors, are almost the only other remains of the time of Charlemagne. The great emperor was buried here, the cathedral in reality being the chapel of his adjacent palace, and his grave is marked by a stone slab bearing the words Carlo Magno. With other relics his bones are preserved in a magnificent reliquary in the cathedral treasury (they were hidden in a copper mine at Siegen during the war). The building also contains his marble chair, long used as the coronation seat, a pulpit presented by the emperor Henry II, and a candelabrum, the gift of Frederick I (Barbarossa) in 1168. The cathedral was damaged by Allied shell-fire in 1944, but not irreparably. The town hall, on the other hand, was completely wrecked. It contained the Kaisersaal or coronation hall of the German emperors, decorated with modern frescoes. It occupied the site of Charlemagne's palace, and dated from the 14th century. Its two fine old towers were restored after a fire in 1883. The old city had also the Grashaus, used for the archives, two of its old gates, and many venerable churches, including that of S. Foillan. The sites of the former city walls are occupied by promenades.

Around the old town, with the fishmarket, the market square, and the cathedral square, lay the newer town, with suburbs, both residential and industrial, stretching away

for some distance. A little to the E. are the springs, and adjacent were the Kurhaus and Kursaal, for which the city was long famous. Valuable paintings were housed in the Suermondt Museum.

Aix-la-Chapelle owes its origin to its springs, which were known to the Romans, who called it Aquisgranum. In the 8th century Charlemagne's father, Pepin, made his residence here, and Charlemagne raised the place, of which he was very fond, to a position of importance. It became, and remained for 700 years, the coronation place of the German kings, most of whom passed some of their time here. Frederick I and Frederick II were among its chief benefactors. It was a free city, but after the coronation of Ferdinand I in 1531, the last to be held here, its importance began to decline.

Aix-la-Chapelle. Air view of the relatively undamaged cathedral taken after the capture of the city in October, 1944. Top right, coronation seat of Charlemagne

It suffered during the Thirty Years War and through fires. In 1801 it became part of France, but in 1815 was handed over to Prussia.

Aix owed its modern prosperity to the opening up of a big coalfield, while its direct rly. communication with Cologne, Brussels, Antwerp, and Liège was another commercial advantage. Its manufactures included cloth and other textiles, iron goods of various kinds, chemicals, and beer. It was also a centre for banking, insurance, and general trading. Sufferers from rheumatism and other complaints derived great benefit from the sulphur and chalybeate baths. Pop. (pre-war) 165,710.

In the Second Great War

From Aix in 1914 the Kaiser's armies advanced to invade the West, and for a time it was the Kaiser's headquarters. Again in 1940 it was made the spring-board of invasion. Industrial targets in Aix-la-Chapelle were repeatedly bombed by British and American planes, 1942-43. Then during the storming of the first line of the Siegfried defences in Sept., 1944, the city became one of the main objectives of the U.S. 1st army. By Oct. 8 the city was encircled, the Americans capturing "Crucifix Hill," a height of 800 ft., to the N.E. of the city. The same day Gen. Hodges's troops closed all but 4 m. of the German escape gap N. of the city, the gap itself being covered by U.S. artillery. The Germans repeatedly attacked Crucifix Hill, and bitter hand-to-hand fighting resulted. The Americans broke into the S.E. suburbs, and, after capturing the district of Haaren, cut the Aix-Cologne highway. On Oct. 10 the U.S. commander issued an ultimatum calling upon the German commander and the burgomaster to surrender the city unconditionally within 24 hours. No reply was received, and the citizens, whose numbers had dwindled to about 15,000, were then "bomarded" by 12,000 leaflets fired from U.S. guns, urging the people to stop the useless destruction and bloodshed.

Meanwhile German forces attacked desperately in an attempt to open the escape gap but without success, and on Oct. 12 Aix was dive-bombed by hundreds of U.S. fighter-bombers. House-to-house fighting reduced many districts to ruins, and the Americans, having tightened the ring round the city, continued to advance through the industrial suburbs, until on Oct. 19 half the city was in their hands.

After a battle in the streets that had lasted seven days, Aix-la-Chapelle finally fell to the U.S. forces on Oct. 20, the last German strongpoint having been overcome. Over 10,000 prisoners were taken during the fighting, and some 3,000 civilians were already assembled in American camps W. of the city. Thousands sheltered in cellars during the violent bombardment.

Aix-la-Chapelle, TREATIES OF. These are three in number:

1. The treaty which, on May 2, 1668, put an end to the short War of Devolution between France and Spain. It was forced on France by the action of the triple alliance of Holland, England, and Sweden; by it France restored Franche Comté to Spain, but retained the conquests made in 1667, consisting of several Flemish towns.

2. A treaty signed on Oct. 18, 1748, and added to on Oct. 5, 1750, which ended the War of the Austrian Succession between Britain, Austria, and Holland on one side and France, Prussia, and Spain on the other. By the peace Frederick of Prussia retained Silesia, and Britain secured the recognition of the Protestant succession and the confirmation of the Asiento contract, i.e. the right to send yearly a vessel to the Spanish colonies for slaves. All conquests were restored, including Cape Breton Island to France and Madras to England. The Empress Maria Theresa and her husband, Francis of Lorraine, were recognized as rulers of the Empire, and changes were made in the map of Italy.

3. In Oct., 1818, Great Britain, Austria, Russia, and Prussia sent representatives to a congress at Aix-la-Chapelle, the duke of Wellington and Lord Castlereagh being the British members. The main object of the meeting was to decide on the policy to be adopted towards France, then occupied by the allied armies. It was decided that France should be evacuated, and the four Powers renewed the alliance which they had originally made to overthrow Napoleon. The members then discussed various other matters, including some differences between Sweden and Denmark and between Spain and her colonists in South America. No practical results followed, but the Congress is interesting because it attempted to settle the affairs of Europe by discussion rather than force.

Aix-les-Bains. Town of S.E. France, in the department of Savoie. A favourite watering-place, it is 8 m. by rly. N. of Cham-

béry, on the Paris-Turin line, and 823 ft. above sea level. Its warm springs are beneficial to sufferers from rheumatism and gout, the waters being used for both baths and drinking. As *Aquae Gratianae*, it was known to the Romans, ruins of whose temples, baths, and triumphal arch remains. The Germans reached Aix-les-Bains June 24, 1940, withdrawing later until they occupied Vichy France in Nov., 1942. The town was liberated by the F.F.I. Aug. 26, 1944.

Aiyar, SIR SHESHADRI (1845-1901). Indian statesman, Born at Palghat, in the Malabar district of Madras, he was educated at the presidency college of Madras. After experience under the British administration, he became in 1883 diwan (premier) of Mysore after its return to native rule. He was knighted in 1893.

Ajaccio. The capital of Corsica. Situated on the W. coast, on the N. shore of the Gulf of Ajaccio, it is connected by rly. with Calvi and Bastia and by steamship with Marseilles and Nice. The seat of a bishop since the 7th century, it has a cathedral, colleges, lib-

rary, museum, the house in which Napoleon I was born, and a large harbour protected by a citadel. It has a wireless station, and exports wood, wine, oil, grain, sardines, anchovies, coral, hides, and chestnuts. Its mild, clear climate makes it a favourite winter resort. Under the Vichy govt., June, 1940, to Nov. 11, 1942, when Italy occupied Corsica, Ajaccio was liberated between Sept. 10 and 17, 1943, by its citizens, and French troops landed here from the night of Sept. 13-14. Pop. 31,434.

Ajaigarh. Former small state in Bundelkhand, Central India, 130 m. S.W. of Allahabad. It is now part of the Vindhya union. The state received its name from its 9th century hill fortress, with ruined Jain temples. Its area is 788 sq. m.

Ajalon OR AJALON. Town and valley of Dan (Josh. 10). Identified with Yalo, N. of Jerusalem, the locality is memorable for the defeat of the Canaanites by the Israelites, when the sun and moon stood still at the word of Joshua "until the people had avenged themselves upon their enemies."

Ajanta OR ADJUNTA. Village and ravine in Hyderabad, India. The ravine is celebrated for its Buddhist cave temples, dating from 200 B.C. to A.D. 600, and decorated with frescoes. See Paintings in the Buddhist Cave Temples of Ajanta, J. Griffiths, 1896-7.

Ajax. In Greek legend, the name of two heroes who fought for the Greeks in the Trojan War. One was distinguished as the son of Telamon, the other as the son of Oileus. Next to Achilles, the former was accounted the mightiest warrior in the Greek host. A single combat between him and Hector, the Trojan champion, ended in the two combatants

Ajaccio. General view of the town, which lies on the north shore of the Gulf of Ajaccio. Above, house in which Napoleon I was born

H.M.S. Ajax. British cruiser which took part in several important naval engagements during the Second Great War, including the Battle of the River Plate

exchanging arms as a token of mutual respect. After the death of Achilles the two claimants for the dead hero's armour were Ajax and Odysseus, and, when the armour was awarded to the latter, Ajax,

Ajax defending his ships
Enlarged from an engraving on an ancient gem

in a fit of frenzy, slaughtered a flock of sheep, supposing them to be his enemies, and killed himself.

Ajax, the son of Oileus, though small of stature, was fleet of foot and a skilful fighter. Because of his profanation of the temple of Athena at the fall of Troy, the offended goddess caused a storm to destroy the ship of Oileus on his homeward journey. Ajax took refuge on a rock, and impiously boasted that he was safe in spite of all the gods. This offended Poseidon, who shattered the rock with his trident, and Ajax was drowned.

Ajax, H.M.S. British cruiser of 6,985 tons, carrying eight 6-in. guns. Under the command of Capt. C. H. L. Woodhouse, and flying the flag of Commodore Henry Harwood, she, with H.M.S. Exeter and H.M.S. Achilles, attacked the German raider Admiral

garrison on Santorin I., N. of Crete, surrendered to her. See N.V.

Ajax Powder. Safety blasting explosive, which is permitted for use in the United Kingdom. It has the following composition: nitroglycerine, 22.5 p.c.; potassium perchlorate, 37.2 p.c.; collodion cotton, 0.8 p.c.; wood-meal, 11 p.c.; dinitrotoluene, 3.5 p.c.; ammonium oxalate, 25 p.c. The mixture is prepared by gelatinising the nitroglycerine with the collodion cotton and incorporating the jelly with the powdered remainder in a mixer of the type employed for cordite or blasting gelatine. The dinitrotoluene lowers the freezing point of the nitroglycerine, while the ammonium oxalate reduces the temperature of the explosion flame. A more recently introduced low freezing type of explosive of this class, Polar Ajax, is permitted for use in coal mines. It contains nitroglycerine-dinitroglycol 24-26 p.c.; ammonium nitrate 44-47 p.c.; nitro-cotton 0.25-1.25 p.c.; nitro-toluenes 1-3 p.c.; sodium chloride 23-25 p.c.; wood-meal 0.5-1.5 p.c.; and moisture. It is obtainable in sheathed form.

Ajmer. Capital of the former British province of Ajmer-Merwara (v.i.), India. In a picturesque

Akbar the Great. Pencil sketch of the great empire builder by one of the painters attached to his court
From Laurence Binyon's *Court Painters of the Grand Moguls*

Graf Spee off the Uruguayan coast on Dec. 13, 1939—a naval engagement fully described under the heading *Plate*, *Battle of River*. On March 28, 1941, she took part in the naval battle of Cape Matapan (q.v.), and on Oct. 18, 1944, the German

valley, 228 m. by rly. W.S.W. of Agra, it stands at the foot of Tara-garh Hill, the fort on which was built by Akbar. It has a surrounding wall, with five gates, and contains the remains of a beautiful Jain temple, converted into a mosque, and the tomb of the 13th century Moslem saint Kwaja. Ajmer has railway workshops, exports cotton, salt, and opium, and specialises in dyeing. Pop. 147,528.

Ajmer-Merwara. Small prov. of India. Comprising three subdivisions, it forms an enclave among states of Rajasthan, and is directly administered by the Indian government. The area is 2,400 sq. m.; highest alt. is 2,855 ft. The chief products are maize, millet, oil seeds, cotton, and wheat. Pop. 583,693.

Ajowan. Small, ribbed fruits of an Indian umbelliferous plant, *Ptychotis ajowan*. Cultivated in the prov. of Bengal, they are much like the so-called caraway seeds, aromatic, with a thyme-like odour. Besides being used in cookery, they are employed in medicine as a carminative.

Ajowan, Indian aromatic and medicinal herb

Ajusco. Range of mountains, of volcanic origin, in Mexico, forming part of the S. wall of the central plateau. They rise to a height of 13,000 ft.

Akaba. Gulf, N.E. arm of Red Sea, and town of same name on the E. side, in Transjordan. The Elath of the Bible (Deut. 2), the town is now Transjordan's outlet to the sea. Early in 1949 a British force was sent to garrison the town under the terms of the Anglo-Transjordan treaty of 1948.

Akalkot. Former native state of India, 250 m. S.E. of Bombay city. It was absorbed into Bombay prov. in 1948.

Akashi. Town and seaside resort of Japan. In Honshu Island, it is some 20 m. S.W. of Kobe, on the Inland Sea. Japanese time is regulated from Akashi. Pop. 38,956.

Akassa. Town of Nigeria. It is an important depot, with engineering works and repairing shops, at the mouth of the Nun channel of the Niger delta. Pop. 35,000.

Akbar, called THE GREAT (1542-1605). Mogul emperor. Jhalal-ed-din M o h a m m e d, surnamed Akbar, and the greatest of the

Mogul emperors in India, was born in Oct., 1542. His reign coincided almost exactly with that of Queen Elizabeth, beginning in 1556 and ending in 1605. His grandfather Babar, part Mughal or Mongol, whence the name Mogul, and part Turk, had invaded Northern India from Afghanistan, and founded the Mogul empire of Hindustan. His father, Humayun, had been expelled, but again invaded India and recovered, without completely establishing, his dominion in 1555. Next year his lieutenant Barram completed the conquest, on Humayun's death, on behalf of the fourteen-year-old boy who was to be known as Akbar. In 1560 Akbar by a *coup d'état* seized the reins of government.

Akbar's sway extended over the Punjab and the Ganges basin as far as Bihar, and before his death had covered the whole of India N. of the Vindhya hills. He conquered because expansion was forced upon him, not from greed of territory. The bulk of his subjects were Hindus, but among them or over them the Mahomedans, of Afghan or Turkish origin, held the predominant position. After their defeat and submission the Hindu princes were restored to a position between vassal and ally.

Akbar, in brief, aimed at creating in India a united and consolidated empire, wherein no man should have good grounds for complaining of injustice to himself, his race, or his creed. He reorganized the government, apportioning his realm to chosen lieutenants. The whole land was brought under a systematic assessment, forming a lasting basis for a reasonable taxation, which provided an ample revenue. Akbar's officers were chosen from Hindus and Mahomedans alike; his great finance minister, Todar Mahl, was a Hindu, and Rajput princes commanded his armies. All were free to practise their religion; the Hindus were relieved from the taxes which had been imposed upon them as Hindus by all the Mahomedan lords of India. Brahmani pundits, Mussulman mullahs, and Jesuit missionaries held debate in the presence of the Great Mogul. In war Akbar was no mean general, while his personal feats of daring and endurance could be matched by few. To his friends he was royally trustful and generous, to his enemies splendidly magnanimous. He was the true founder and creator of the Mogul Empire, which during its great days was perhaps the most

splendid that the world has ever known. Akbar died at Agra Oct. 15, 1605. See Akbar, G. B. Mallison, 1903; Akbar, the Great Mogul, Vincent A. Smith, 1917; Akbar, Laurence Binyon, 1932.

Akee. Fruit of a W. African tree (*Blighia sapida*) introduced into S. America and the W. Indies. The tree grows to a height of 30 ft. and has compound leaves and sprays of white flowers. The fleshy fruit is three-sided, red tinged with yellow, and about 3 ins. long. When ripe it splits down each side, disclosing a white spongy substance (aril) in which three shining black seeds are embedded. The aril is the portion eaten, and has a pleasant sub-acid flavour.

Akeman Street. Early English name for a Romanised road which, leaving the Fosse Way at Cirencester, skirted the northern Thames valley by Alchester, crossed the Icknield Way at Tring, and joined Watling Street at St. Albans. It was an alternative to the Silchester road from Bath to London.

à Kempis, THOMAS (c. 1379-1471). Augustinian monk and devotional writer. His family name was Hammerken, and he was born at Kempen, near Düsseldorf, of peasant parents. At the age of twelve he began to attend a school at Deventer, Holland, conducted by the Brothers of the Common Life (*q.v.*). The founder of the school, the saintly Gerhard Groot (*q.v.*), was one of his boyhood heroes. Always seeking solitude and preferring only the company of books, he went about 1400 to the Augustinian monastery of Mont S. Agnes, near Zwolle, where his brother was prior. Here in 1406 or 1407 he became a monk, and here the whole of his life was spent. From time to time he held office in the community, but the greater part of his time was occupied in writing chronicles of his monastery, biographies, books of devotion, hymns, and sermons, and copying MSS. He made a complete copy of the Bible in addition to copying missals and also books of hours. His numerous writings on the monastic life include *The Solitary Life*, *The Life of the Good Monk*, *The Discipline of the Cloister*, and *The Soul's Soliloquy*.

His fame rests on *The Imitation of Christ*, first published anonymously in 1418, completed in 1424, and since that date translated more widely than any volume except the Bible. At the end of the 19th century over 3,000 editions of the *Imitation* had been

issued. Written in Latin and divided into four parts, its original purpose was a closer following of the counsels of perfection by those vowed to the religious life. The strength of its extensive appeal lies in the author's knowledge and experience of the unchanging needs of the human heart and the simple sincerity of his writing.

The earliest printed copy of the *Imitation* was published at Augsburg in 1471 or 1472, and the first English translation was printed in 1502. Of the many later English translations mention may be made of John Wesley's, 1735; Challoner's, 1737; and Payne's, 1763. New editions and translations are of frequent occurrence. The authorship has been disputed, and since the 17th century claims have been made on behalf of John Gerson, chancellor of the University of Paris, and of J. Gersen, a Benedictine monk of whom little is known. But the evidence is entirely in favour of Thomas à Kempis. See Thomas à Kempis, S. Kettlewell, 1882; Thomas à Kempis, F. R. Cruise, 1887; and *Story of the Imitatio Christi*, L. A. Wheatley, 1891.

Akenside, MARK (1721-70). British poet and physician. Born at Newcastle-on-Tyne, Nov. 9, 1721, and intended for the Non-conformist ministry, he turned from theology to medicine, studying first at Edinburgh and then at Leyden, where he graduated in 1744. Returning to England in that year, he published *The Pleasures of Imagination*, a didactic poem in blank verse, which won immediate recognition. For a time he practised as a physician at Northampton and at Hampstead, but achieved little success until his friend Jeremiah Dyson established him in Blooms-

Mark Akenside

bury Square and made him an allowance of £300 a year. Having been made fellow of the College of Physicians, in 1754, and principal physician at St. Thomas's Hospital, in 1759, he practically abandoned literature. He died in London June 23, 1770.

Akenside is perhaps less remembered for his blank verse poems than for his appearance in Smollett's *Peregrine Pickle* as the physician who provides a banquet in the style of the ancient Romans. He deserves to live, however, as the author of the pungent satiric

couplets of An Epistle to Curio. *Consult* Poems, ed. with Life, A. Dyce, 1854; Poetical Works with Memoir, C. Cowden Clark, 1840.

Akershus. Variant spelling of the Norwegian county and town of Aggershus (*q.v.*).

Akhal Tekke. Oasis of the Ashkhabad district of Turkmen S.S.R. It is peopled by Tekke Turcomans.

Akhetaton. City of ancient Egypt, on E. bank of the Nile. It was founded about 1369 B.C. by Akhnaton (*q.v.*) when he withdrew his court and capital from ancestral Thebes to a site at Tell el-Amarna. He named the new city Akhetaton, meaning "horizon of Aton" (the sun god).

Akhetaton is the only example showing how a great city was laid out in the time of the Egyptian empire. The ruins show clearly, as nowhere else, the plans of its palaces, temples, houses, and villas, and a village of four-roomed houses for workmen. The better-class houses had their bathrooms with drains. The many noblemen's estates made it rather like a garden city on the edge of the desert. Here were found the famous Tell el-Amarna letters. *See* Tell el-Amarna.

Ak-Hissar. Town of Asiatic Turkey. It is the Greek Thyatira, and the Turkish name means white castle. On the Soma-Manissa rly., 52 m. N.E. of Izmir, it exports marble, cotton, dyes, opium, and wool. It was an old town when the Greeks recaptured it in 290 B.C., and one of the Seven Churches of Asia was here. Pop. 18,026.

Akhlat, KHILAT OR ARDISH. Town of Turkish Armenia. It stands on the N.W. shore of Lake Van, and was the ancient capital of Armenia. Pop. 4,000.

Akhmin. Variant spelling of the name of the Egyptian town known also as Ekhnmin and Ahmin. *See* Ekhnmin.

Akhnaton, IKHNATON OR KHUENATON. Egyptian king of the XVIIIth dynasty, about 1375 B.C. Son of Amenhotep III and his half-Syrian queen Tyi, he began his reign as Amenhotep IV. He abandoned Ammon worship for that of the solar disk, Aton, and changed his name and capital accordingly (*see* Akhetaton). This monotheistic reform was brief, hardly surviving Akhnaton's death, c. 1358 B.C. *Consult* Life and Times of Akhnaton, A. Weigall, 1933.

Akhtyrka. Town of the Ukraine S.S.R., about 65 m.

N.W. of Kharkov. In a fertile fruit-growing district, it trades in agricultural produce and manufactures woodwork, pottery, and sheepskin coats. Pop. 25,750.

During the Second Great War Akhtyrka was one of several towns engulfed in the heavy fighting that raged throughout this sector of the Ukrainian front when the Germans thrust towards Kharkov at the end of Oct., 1941. The town was recaptured by Soviet forces on Aug. 11, 1943.

Akita. Seaport of Japan, on the W. coast of Honshu. The capital of the prefecture of Akita, it trades in rice and manufactures silk and cotton cloth. Pop. 34,500.

Akka. Turkish name for the ancient Syrian city known as Acre (*q.v.*), or in full, St. Jean d'Acre.

Akka. Tribe of pygmy forest-hunters in the Belgian Congo. They were found by Schweinfurth in 1870 in the Aruwimi forests between the Congo and the Albert Nyanza. Their Niam-Niam neighbours call them Tiki-Tiki. Descended from the dwarf negroid race depicted on early Egyptian monuments and traceable in palaeolithic Europe, their ape-like characters—snout-like jaw, top-heavy head, long arms, and weak, inturned feet—betray an arrested human development. Their beehive grass huts, poisoned arrows and iron weapons evince cultural contact with negro peoples. Measured individuals vary from 3 ft. 4 in. to 4 ft. 10 in. in height.

Akkad. Ancient Mesopotamian city. The Accad of Gen. 10, it is identified with the pre-Semitic Agade, the capital of Sargon I (c. 2800 B.C.). Its ruins, which were unearthed between 1917 and 1919, reveal it as a

Akhnaton. Heretical king of Egypt, who instituted worship of the sun
Berlin Museum

garden city, stretching for 20 m. along the left bank of the Tigris *See* Samarra.

Akkerman. Fortified town of Ukraine S.S.R. On the Dneister estuary, near the Black Sea, and 30 m. S. of Odessa, it exports wine, salt, fish, tallow, and wool. A Russo-Turkish treaty was concluded here in 1826. Pop. 33,495.

Akka. Primitive pygmy people of the Aruwimi forests in Central Africa

Akkerman was occupied by Soviet troops after Russia's ultimatum to Rumania in June, 1940, demanding the return of Bessarabia. When Rumania joined Germany in attacking Bessarabia, the Russians evacuated the town. They returned three years later, when, in Aug., 1944, the Soviet 3rd Ukrainian army, crossing the Dniester, broke through powerful defences along the Bessarabian frontier and cut the Akkerman-Bolgrad rly. By Aug. 23, on which date the Russo-Rumanian armistice was announced, Akkerman was again in Russian hands.

Alma Dag. Variant spelling of the mt. range in Asia Minor known also as Alma-Dagh and less commonly as Elma-Dagh. *See* Alma-Dagh.

Akmolinsk. A town and region of Kazakh S.S.R. Situated N.E. of the Aral Sea, 280 m. S.W. of Omsk, on the Ishim, the town was founded in 1862, and is an important traffic centre. Pop. 10,000.

Akola. Tn. and former dist. of Berar, India. Assigned by the Nizam of Hyderabad to the British in 1853-61, the district has an area of 4,110 sq. m. and produces wheat, cotton, aniseed, opium, tobacco, and some indigo. The town, divided by the river

Morna, is 363 m. by rly. N.E. of Bombay, on the Great Indian Peninsula rly. It was the headquarters of the commissionerhip of W. Berar and is a cotton centre. Pop. of town. 62,564.

Akron. Capital of Summit co., Ohio, U.S.A. It is on the Ohio Canal, 36 m. S.S.E. of Cleveland. The seat of a university, its manufactures include rubber, flour, woollens, and machinery, and coal is mined near. The canal and also the Little Cuyahoga river supply water power. Pop. 244,791.

Akron. U.S. naval dirigible airship, constructed at Akron, Ohio, in 1931. She was 785 ft. long, had eight engines giving a total of 4,480 h.p. and a maximum speed of 83 m.p.h., her gas volume of 6,500,000 cub. ft. being nearly twice that of the Graf Zeppelin. Helium non-inflammable gas was employed as in other U.S.A. airships. She was the world's largest airship at that time. She was commanded by Lt.-Commander F. C. McCord with Lt.-Commander H. V. Wiley as executive officer. On April 4, 1933, on a flight from Lakehurst she ran into a hurricane and crashed into the sea. Lt.-Commander Wiley and two men were the only survivors of 77 officers and men. She cost about £1,075,000.

Aksehir or **WHITE CITY.** The Philomelion of the Greeks, it is in the vilayet of Konieh, Turkey, 5 m. S. of the salt lake of the same name. It manufactures carpets.

Aksu (Turkish, white water). Name of several rivers of Asia. The chief, rising in the Pamirs, becomes a tributary of the Murghab.

Aksum. Variant spelling of Axum, or Axumis, a town of the Abyssinian prov. of Tigré. See Axum.

Akyab. Island, district, and seaport of Arakan, Burma. The port, on the E. side of the island, at the mouth of the Kaladan, developed since 1826 from a small fishing village to an important commercial town. It has several public buildings, the principal being the court house, the custom house, a high school, and a hospital. It has a number of large rice mills, and, in addition to rice, exports oil and timber. Pop. 36,569. During the Second Great War the island and port were bombed by the Japanese on May 3, 1942, during the latter's drive westwards across Burma from Rangoon and Mandalay. On May 8 the enemy occupied Akyab, the last Burmese port in British hands. It then became the chief Japanese

base in Arakan and was a target for a series of raids by Allied bombers operating from India. The small island was also the objective of two unsuccessful counter-offensives by the Allies, and from its airfield the Japanese launched raids on Calcutta in 1942 and 1943. On Dec. 31, 1944, three Indian Air Force pilots of a tactical reconnaissance squadron made one of their routine low-level inspections of the island. They saw derelict defences, evidence that the Japanese had evacuated Akyab; and on Jan. 4, 1945, British commando and Indian troops landed, and advanced inland from the coast, having reoccupied the town and port.

The district of Akyab, a level tract between the Arakan Yoma Mts. and the Bay of Bengal, covers an area of 5,136 sq. m. It is watered by the Kaladan, Mayu, and Lemru rivers, which form a network of channels in their lower courses and a delta as they approach the sea. Their valleys are extremely fertile and produce an abundance of rice.

Al or **El.** Arabic definite article. It occurs as a prefix in several English words, such as alchemy, alcove, alembic, algebra, elixir. In some cases it is difficult to recognize; thus, apricot is ultimately derived from *albirquq*. As *al* in alhambra and alkoran signifies *the*, the addition of the English definite article before these and similar words is redundant and justified only by popular usage.

Alabama. River of the U.S.A. Formed by the junction of the Tallapoosa and the Coosa, it follows a sinuous W. and S.W. course to its confluence with the Tombigbee, their joint waters being carried thence by the Mobile to Mobile Bay. The Alabama flows through a richly timbered and cultivated region, and through a railway, and one of its head-streams, the Coosa, serves as a means of transport for the mining district in the central part of the state. Its chief tributary is the Cahawba, about 200 m. long. Montgomery, the state capital, lies on its left bank. Its length is 312 m., and it is navigable by small vessels.

Alabama. One of the states of the U.S.A. Organized as a territory in 1817, and admitted as a state Dec. 14, 1819, it has a short coast line on the Gulf of Mexico and is bounded N. by Tennessee, E. by Georgia, W. by Mississippi, and S. by Florida.

Its extreme length is about 335 m., average breadth about 180 m., and area 51,609 sq. m. Its chief river is the Alabama. The state is also drained by the Tennessee river, which traverses almost its entire breadth. Alabama is part of a great area, for the most part level, known as the southern coastal plain, which is believed to have emerged from the Gulf within recent geological time. It consists of wide lowlands largely under cultivation, but there are also in the S. extensive pine forests, yielding valuable timber. In the N.E. the surface is hilly.

The great cotton belt, consisting of extremely rich soil, lies in the S.E. corner, and here slavery had its strongest hold. The chief industry of the state is agriculture and the population, which averages 55.5 to the sq. m., is mainly rural. Maize and corn are the chief cereal crops, and the state raises normally about one-fifteenth of the country's cotton. Hay, peanuts, oats, potatoes, wheat, sugar, peaches, and tobacco are important crops. Rice is grown on the reclaimed wet lands of the Mobile valley, where there are also many gardens, which yield early vegetables. The output of coal amounts to 15 million short tons a year, and of pig iron to over three million tons. Birmingham is known as the Pittsburgh of the South. Several locks and dams associated with the Tennessee Valley Authority are situated in the state, which has shared the consequent benefit of increased hydro-electric power. Oil of a commercial quality has been worked since Feb., 1944. Cereals, cotton, timber, cattle, linseed, sugar, and tobacco are exported.

Excellent internal communication is afforded by the rivers, and over 5,000 m. of railways are in operation. The state is served by the Delta, Eastern, and Pennsylvania air lines. The university of Alabama (1831) is the principal educational institution. Nine representatives and two senators are returned to Congress.

Though the state ranks 28th by size, it is 17th by population. The chief cities are Birmingham, the centre of the iron and steel manufactures, with a population of 267,553; Mobile, the only seaport, with 78,720, and Montgomery, the capital, with 78,084. The population at the census of 1940 was 2,832,961, of whom 1,849,671 were whites and 983,290

negroes, with a few hundred (Red) Indians, etc. Alabama was first visited by Spaniards, and in 1539 by De Soto. The French settled there in 1702. It was ceded to the British in 1763 and gradually acquired by the U.S.A. At Montgomery, Feb. 4, 1861, the existence of the Confederate states was voted. *Consult* Alabama, a Social and Economic History, M. B. Owen, 1938.

Alabama Question. Dispute between Great Britain and the U.S.A. On July 29, 1862, during the American Civil War, the Alabama, a vessel just built at Birkenhead, sailed for the Azores. There she was armed, and, hoisting the Confederate flag under Captain Semmes, did enormous damage to the shipping of the North, until sunk, June 19, 1864, off Cherbourg, by the Kearsage, under Captain Winslow.

The Federal Government laid the blame on Great Britain. Contrary to the proper observance of neutrality, the vessel had been allowed to leave an English port, although the United States consul at Liverpool had acquainted the authorities with her real character. By the time they had ordered the seizure of the vessel, she had sailed. In 1871 a treaty for the settlement of the question by arbitration was signed at Washington. The claims included those for damage done by two other vessels, the Florida and the Shenandoah.

The five arbitrators were Sir Alexander Cockburn for Great Britain, Mr. C. F. Adams for America, and one each from Italy, Switzerland, and Brazil. They met at Geneva Dec. 15, 1871, under the presidency of the Italian representative, and adjourned until the following June. After a disagreement affecting indirect claims had been settled, the arbitrators decided unanimously that Britain was responsible for the damage done by the Alabama, and by a majority that she was responsible for that done by the other vessels. The final award was signed Sept. 14, 1872, the damage being assessed at 15,500,000 dols., about £3,230,000.

Alabamine. Chemical element of the radioactive series, symbol Ab and atomic no. 85. Its atomic weight is 221. A very rare element, it has not been certainly isolated.

Alabaster. Massive translucent form of gypsum. It is often found associated with salt-deposits in the form of beds and nodular

masses. It occurs in the Triassic rocks of Britain, and is used as an ornamental stone. According to Pliny, the name is derived from Alabastron, a town in Egypt, whence it was obtained. A calcite alabaster was used in ancient times for ointment vases. Banded marbles of this type (onyx) came from Algeria, Egypt, and Mexico.

Alabat. One of the smaller of the Philippine Islands. Lying to the N. of the Luzon isthmus, in Lamon Bay, it covers an area of 95 sq. m., and has a well-wooded interior. It is thinly populated.

Alachua. Former Seminole town of Florida, U.S.A. It was settled about 1710 by Creeks, who came from Oconee in Georgia, and the name was later made to cover other villages in the neighbourhood. The Alachua Indians resisted the incursion of white colonists early in the 19th century, and were prominently concerned in the Seminole War of 1835-42.

Ala Dag. Mountain range in Turkish Armenia, N. of Lake Van. The alt. is about 11,400 ft.

Aladdin. Hero of a story included in most English and French versions of The Arabian Nights' Entertainments, although not in any Arabic text of The Thousand and One Nights. The story tells how Aladdin, the son of a poor widow, meets an African magician and becomes possessed of a wonderful lamp. Helped by the genie, who appears whenever the lamp is rubbed, Aladdin provides himself with jewels and fine clothes, and wins the hand of Princess Badroulboudour, the sultan of China's daughter. The magician employs all his arts to regain the lamp, among other devices offering, in the guise of an itinerant merchant, "new lamps for old." The magic lamp which fulfils its owner's wishes occurs in the folk-lore of nearly all Europe as well as that of India and China.

Alagoas. Maritime state of Brazil, on the Atlantic coast, between Pernambuco and Sergipe. Coastwards, where there are lagoons, the country is low and marshy; to the N.W., mountainous and forested. The products include sugar, dye-woods, cotton, tobacco, and coffee. There is rly. connexion with Pernambuco. Maceió is the capital and chief port. Other towns are Alagoas and Penedo, a port on the São Francisco river. Area 22,577 sq. m. Pop. 1,043,600.

Alagon. River of Spain. It flows 120 m. to the Tagus, near Alcantara, and is noted for its fish.

Alagos OR ALI-GHEZ. Mt. of Transcaucasia, in Armenia S.S.R. Of volcanic formation, it has an alt. of 13,450 ft.

Alais. Town of France, in the department of Gard. On the river Gardon, it lies at the foot of the Cévennes, 25 m. N.N.W. of Nîmes, and is a junction on the Paris-Lyons Rly. Its buildings include the church of St. Jean, a citadel, and a school of mines. It has many silk mills and a large trade in cocoons and ribbons. The centre of a mineral field producing coal, iron, lead, zinc, and asphalt, it has large iron-works and glass, brick, tile, and cloth manufactures. It was taken from the Huguenots by Louis XIII in 1629, when the Peace of Alais closed the civil wars in France. Pop. 36,400.

Alai Tagh. Mt. chain in Kirghiz S.S.R., a western continuation of the Tian-Shan system. The Trans-Alai, a parallel chain on the S. side of the Alai valley, includes Mt. Stalin (24,590 ft.) and Mt. Lenin (23,383 ft.).

Alajuela. Capital of Alajuela province, Costa Rica, Central America. It is 15 m. W. of San José on the rly. to Punta Arenas and has a large trade in sugar and coffee. The prov. contains the Aguacate gold mines. Pop. prov., 152,713; town, 10,170.

Ala-Kul OR KURGH-NOR. Lake in Kazakh S.S.R., near the border with Sinkiang. It is 45 m. long, 20 m. broad, and 837 ft. above sea level.

Alaman, LUCAS (1792-1853). Mexican statesman and historian. After sitting as deputy for the colony in the Spanish Cortes, he returned in 1823 to Mexico, and became foreign minister. He wrote an important history of Mexico.

Alamanni OR ALEMANNI. Name given to a confederacy of Germanic tribes which first came into prominence around the river Moenus (Main) in the 3rd century A.D. The duchy of Alamannia or Swabia was named after them, and from them are derived the French names of Allemand and Allemagne for German and Germany. At one time they spread into Alsace and Switzerland. They fought against the Romans and Franks, but were subdued by Clovis in 496.

Alameda. City of California, U.S.A., in Alameda co. It is on San Francisco Bay, opposite San Francisco and adjacent to Oakland, and is a summer resort, with shipbuilding, petroleum, and earthenware industries. Pop. 36,256.

for just such a move. After two days of fierce fighting, with heavy tank losses on both sides, the 8th army held Rommel. Throughout Sept. 2 his armour remained massed behind the British lines, under heavy shell fire; then, on Sept. 3, 4 and 5, it withdrew, leaving 42 German and 11 Italian tanks and nearly 700 motor vehicles behind it.

Alexander was now free to prepare his great counter-stroke. At last he was to have equipment in plenty and of the type he needed—better tanks and more of them, Crusaders and Grants and the 300 Shermans, originally allotted to the U.S. army, which the U.S. president had so generously diverted; an adequate tank recovery and repair organization; more and better guns, notably self-propelled guns and the 6-pounder anti-tank; vastly expanded air forces, which included three (by Jan., 1943, eight) squadrons of the U.S. 9th A.A.F.; and the organization for greatly developed lines of communication.

As to training, too, the 8th army had profited by its hard experience. In the fighting ahead it was to use a new technique of armoured warfare in face of mines and anti-tank guns; it was to revert to those old principles of artillery employment, centralised control and concentration of fire, and so to make the best use of its guns; and it was to perfect a system whereby concentrated air power could be applied at the decisive point in the minimum of time. Moreover, the 8th army, closing from the E., would be but one claw of the pincers, the other claw of which would close from the W. at Casablanca.

Alexander would not attack, however, until he had won command of the air and completed his preparations for the pursuit across Cyrenaica. Meanwhile the ceaseless attacks on Rommel's communications, both by aircraft and by submarine, continued. Soon his ammunition and petrol reserves began to run dangerously low, but he still maintained the equivalent of about 12 divisions.

By Oct. 23 the preliminary battle of the air had been won, and Montgomery had completed his concentration at Alamein for the land battle. Between sea and depression, the two opposing armies faced each other, behind their two front lines of minefields and strong-points.

The popular legend, fostered by semi-official accounts of the battle, that Rommel deliberately weak-

ened his centre as a trap for the 8th army is untrue. In fact, Axis troops, commanded by Gen. Stumme—Rommel had gone to Germany sick in Sept.—were fairly evenly divided. The N. sector, held by two Italian and one German divs., was stronger than the S., held by the best of the Italian divs. Stumme split his armour into battle groups, stationed evenly along the whole front.

Montgomery, with Alexander's approval, proposed to make his main attack in the N., where Stumme's front was strongest, and a secondary attack in the S. To this end he had divided his own front between two corps; in the N. he had placed the 30th corps, whose five infantry divisions were to deliver the main attack; in the S. the 13th corps, whose two infantry divisions—together with the 7th armoured division and the Fighting French—were to deliver attacks mainly diversionary in character.

The British Attack

At 9.40 p.m. on the bright moonlight night of Oct. 23, nearly 1,000 guns massed on a 6-mile front in the N. opened a 15 minutes' counter-battery bom-

proved necessary. The two armoured divisions, however, were committed as early as Oct. 24 according to the original plan, and there followed anxious days of indecisive fighting marked by heavy tank losses. At last, Oct. 26-28, the 1st armoured div. of 10th corps with the 7th armoured div. of 13th corps and the 2nd New Zealand div. were withdrawn to reorganize.

Stumme died of a heart attack on Oct. 23, and Rommel was back in command on the 26th. Massed Axis tank attacks followed, but were beaten off. Then at 1.15 a.m. on Nov. 2 the 2nd N.Z. div. with 151 and 152 bdes. under command delivered a new attack. The breach was made, and the 10th corps passed through, followed by the 7th armoured div. By this time Rommel, too, had concentrated all his armour in the N., and by 6 a.m. on Nov. 2 the opposing armour met in head-on collision. In the heavy fighting that followed round Tell el Aqqaqir (Akakir), the 1st armoured div. and the 9th armoured bde. particularly distinguished themselves. By the night of Nov. 2-3 Rommel's armour was broken, and he had begun to withdraw. By Nov. 4 he was in full retreat, pursued by the R.A.F. and 10th corps, now regrouped for pursuit with 1st, 7th, and 10th divs. under command.

From the N., meanwhile, the 2nd New Zealand division had swung S. across the line of retreat of the Italians, who—

Alamein. Australians approaching an enemy strong-point under cover of a smoke screen on Oct. 24, 1942

bardment of Stumme's gun-positions. Then, at 10 p.m., both the 30th and the 13th corps attacked. At the same time the new 10th corps, consisting of the 1st and 10th armoured divisions which had been held far back behind the front, moved up secretly behind the 30th corps, ready to break through as soon as the 30th corps had punched a hole for it.

Such was the plan as originally conceived. And such was the plan as finally carried out—with this difference: the time which the 30th corps would take to prepare the way for the tanks had been estimated as a matter of hours, whereas in the outcome nine days of infantry fighting and air attack

transport commandeered by the Germans—surrendered in droves. In all, the battle cost Rommel 55,000 men (two-thirds of his force), 450 tanks, and 1,000 guns—against the 13,500 casualties (less than 8 per cent) suffered by Montgomery.

By Nov. 12 the 8th army had driven the enemy beyond the Egyptian frontier, and was well away on its great pursuit, which was to carry it over 1,400 miles of desert in the 2½ months to come. Four days earlier, on Nov. 8, U.S. troops had landed at Casablanca. Consult *The African Campaign*, 10th Aug., 1942, to 13th May, 1943, Alexander's dispatch, H.M.S.O. 38196, 1948.

Alan, A. J. Pseudonym of a British broadcaster, Leslie Harrison Lambert (d. Dec. 12, 1941). He was a pioneer in the art of story-telling at the microphone, his stories being narratives of alleged personal adventure, related with a studied informality, and always ending abruptly, with a hint of some significant facts that remained unspoken. He broadcast his first story, *My Adventure in Jermyn Street*, in 1924. The mystery of his identity, sedulously fostered and strictly maintained until his death, did not detract from his great popularity.

Alanbrooke, ALAN FRANCIS BROOKE, 1ST VISCOUNT (b. 1883). British soldier. Born July 23, 1883,

Lord Alanbrooke,
British soldier

at Bagnères de Bigorre, France, he was educated abroad and at the Royal Military Academy, Woolwich, joining the Royal Field Artillery in 1902. Serving throughout the First Great War in France, he commanded the 8th Infantry Brigade 1934-35, and was G.O.C.-in-C. Anti-Aircraft Command in 1939. Brooke then went to France with the B.E.F. as commander of the 2nd Corps; and in July 1940 succeeded Ironside (*q.v.*) as C.-in-C. Home Forces. On Nov. 25, 1941, he was appointed chief of the Imperial General Staff in succession to Dill, and was promoted field marshal in 1944. In Aug., 1945, Brooke was created a baron, taking the title of Lord Alanbrooke. In Jan., 1946, he received a viscounty, and in the following June the O.M. He retired from the army the same summer. He is an expert in gunnery in all branches and an authority on mechanization.

Alans OR ALANI. A barbarian tribe of Sarmatian race. From their home in the Caucasus they ravaged the eastern provinces of the Roman empire; in A.D. 276 they were defeated in Asia Minor by the emperor Tacitus. In the 4th century they were conquered by the Huns and divided into two main branches. One went westwards with the conquerors; the other took up its abode in the Caucasus, where it is represented by the Ossetes.

Alaotra. Lake of Madagascar. Situated 75 m. N.W. of Tamatave, it is 38 m. long.

Alarcon y Mendoza, JUAN RUIZ DE (c. 1581-1639). A Spanish dramatist. Born in Mexico, he studied at Salamanca and lived mostly in Spain. In 1613 he produced his first play, which was unsuccessful. The best of his later plays are *Truth Suspected*, *Walls Have Ears*, *The Weaver of Segovia*, and *Winning Friends*. He died at Madrid, Aug. 4, 1639. His works were published in collected editions in 1852 and 1884.

Alaric I (376-410). King of the Visigoths. On the death of the emperor Theodosius in 395 the Goths revolted under Alaric, a youthful chief belonging to one of their noblest families, the Balts. Alaric overran Greece and Epirus, thereby securing from the eastern emperor, Arcadius, the imperial office of captain general of Illyricum, while the Goths honoured the successful chief by electing him their king. Alaric soon turned his arms against Italy. In 403 he was checked at Pollentia by the imperial general Stilicho, who held him at bay for five years. The execution of Stilicho in 408 on a charge of treason left Alaric without any capable adversary. In 408 and 409 he ravaged N. Italy, exacting ransom from Rome, and in 410 stormed and sacked Rome itself, which no foreign foe had entered for 800 years. The destruction wrought by the barbarians was accompanied by remarkable instances of clemency. From Rome Alaric overran S. Italy, but died suddenly while invading Sicily. His successor Ataulf withdrew the Goths from Italy. *Consult* Italy and Her Invaders, T. Hodgkin, 1892.

Alaric II (d. 507). King of the Visigoths. He succeeded his father Euric as eighth king in 485. Though an Arian, he permitted the Catholic synod of Agde to be held, 506. On the score of his heterodoxy he was attacked by the newly baptized Frank king, Clovis, who defeated the Goths at the Campus Vogladensis (Vouillé), near Poitiers, in 507. Alaric was slain in the rout after the battle. The legal code known as the *Breviary* of Alaric was compiled in his reign.

Alas, LEOPOLDO (1852-1901). Spanish critic and author, known by his pen-name of Clarin. He was a professor of the university of Oviedo, and one of his novels, *La Regenta*, takes high rank in modern Spanish fiction.

Alasehir. City of Asiatic Turkey, in Manisa vilayet. The ancient Philadelphia, it is 104 m.

by rly. E. of Izmir. It has many remains of antiquity, and a trade in natural mineral waters, cereals, cotton, and tobacco. It was founded about 150 B.C. by Attalus Philadelphus, king of Pergamos, and is supposed to have been one of the Seven Churches of Asia. Pop. 33,000.

Ala-shan. Mt. range of China. Extending 150 m. from N.E. to S.W., it separates the Mongolian territories of Ordos and Ala-shan. Its greatest height is over 11,000 ft.

Ala-shan OR HSI-TAU. Territory of Inner Mongolia. It is bordered S. and W. by the Chinese prov. of Kan-su, E. by the Ala-shan range and the Hwang-ho. Called also Little Gobi, it is part of the Gobi desert and is sparsely peopled by Kalmucks.

Alaska. Trade name for a textile yarn made up of undyed wool or mohair and cotton which is combined by carding or drawing processes. It is woven into cloth for women's coats and dresses.

Alaska (Aleut. *alak'shak*, or *al-ay' ek-sa*, a great country or continent). Territory of the U.S.A. In the extreme N.W. of N. America, it was purchased from Russia by the U.S.A. in 1867 for \$7,200,000 (about £1,450,000), and constituted a territory in 1912. The main E. boundary is formed by the 141st W. meridian, but the territory continues also S.E. along the coast for about 500 m., and takes in a narrow strip of the mainland and the islands of the Alexander Archipelago. The curved chain of the Aleutian Islands, extending over 1,500 m., also forms part of Alaska.

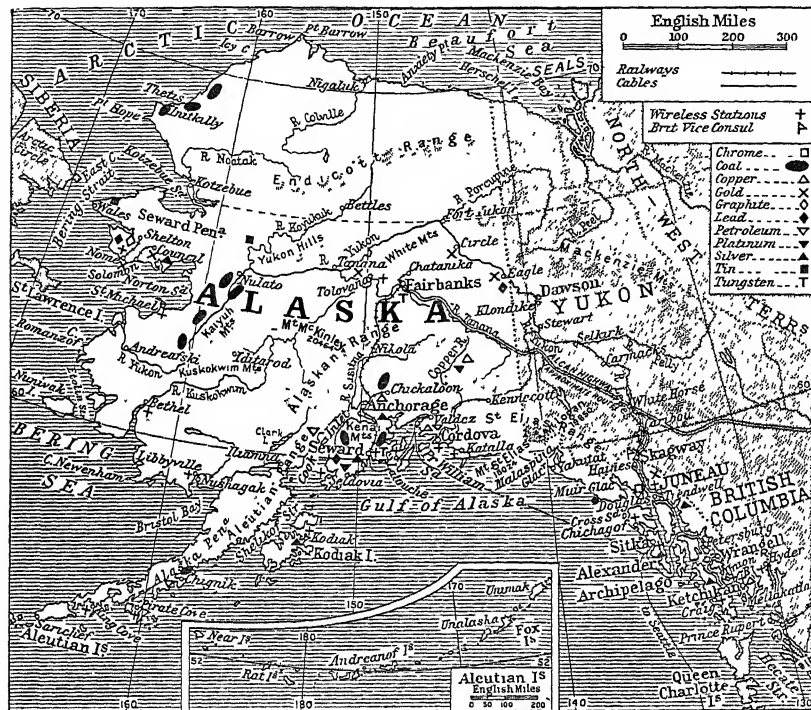

PHYSICAL FEATURES. The total area is 586,400 sq. m., or nearly five times that of the British Isles, about one-third being situated within the Arctic Circle. The irregular coastline, which extends to 26,000 m., exceeds that of the whole of the U.S.A. The country in the S. and S.E. is extremely mountainous, and contains several of the highest summits of N. America, notably Mt. McKinley (20,464 ft.), the loftiest in the continent, and Mt. St. Elias (18,024 ft.). From the snow-caps of the mt. chains huge glaciers descend to the sea; of these the best known are Muir Glacier and the Malaspina Glacier, flowing from the St. Elias range.

Numerous active and quiescent volcanoes are met with from Cross Sound to the Aleutian Islands, the action of which has doubtless been responsible for the irregular configuration of the land

in this belt. The N. and central region is a vast plateau, with low tundras or treeless steppes extending inland for many miles, broken at intervals by mts. and dotted with innumerable lakes and swamps. The Yukon river, navigable for upwards of 1,850 m., with its tributaries, forms one of

Canada and the U.S.A. The Richardson Highway runs from Valdez to Fairbanks (371 m.), and other roads link up with Matanuska, and with the Yukon river at Circle. There is steamer transport on the Yukon and Tanana rivers. Airways are extensively used; for example, Nome, in the

communities have grown up in the Matanuska valley and in the region of Fairbanks, though in 1939 only about 7,000 acres were harvested. Most of the hardy grains and vegetables can be grown S. of the Arctic Circle, and dairy and poultry farming have been developed to a considerable extent.

Alaska. The north-west extremity of the North American continent, where it is divided from Asia by Bering Strait. It was bought by the United States from Russia in 1867

the important drainage systems of the world; about 1,600 m. of its course pass through Alaska. The climate has a wide range; under the influence of the ocean the S. portion of the coast has a mild temperature, while in the interior the frosts of winter are said to penetrate 30 yds. below the surface. The rainfall is plentiful; at Sitka the mean annual fall registers more than 80 ins., and on some parts of the coast and in the islands as many as 110 ins. are recorded. In the interior and the N. the fall is inconsiderable.

COMMUNICATIONS. The Alaska Railroad, completed in 1923, runs from the ports of Seward and Whittier as far as Fairbanks. The opening in 1942 of the Alcan Highway (*q.v.*), constructed as a war measure to facilitate the supply of U.S. forces in the Aleutian Islands, brought Alaska into direct road communication with

Seward peninsula, is connected with Fairbanks by a daily air service. Another regular service links Fairbanks with Seattle, Washington.

INDUSTRIES. The fur-bearing animals, moose, fox, beaver, and mink, are decreasing, but fur-seals and otters are caught in numbers limited by official regulations. Mt. McKinley National Park (over 3,000 sq. m.) was established in 1917 primarily to preserve the wild game. More important is the huge catch of salmon, which provides the basis for the large canning industry. In 1939 the fishing and canning industries provided employment for about one-third of the total population. Cod, herring, and halibut are also caught in abundance. The national forests cover a surface of more than 20 million acres, and yield white spruce and excellent yellow cedar. Farming

Coal-mining is an increasing industry, chiefly at Eska Creek. Copper is mined near the Copper river, Prince William Sound, and in the Ketchikan district. Gold is mined in several areas, notably in the Yukon region and at several places on the W. coast; the chief development of quartz-mining is at Juneau, while centres of lode mining are Fairbanks and Tolovana in the Yukon valley, Seward, Circle, and Tolstoi. Graphite is obtained in the Seward Peninsula. Platinum is mined in the Seward and Copper river districts and tungsten near Seward and Fairbanks.

Other deposits awaiting full development are chromium, antimony and tin. There is a large petroleum reserve in the N.

POPULATION, GOVERNMENT, ETC. The natives are of two stocks: the Eskimo, or Innuut, and the Indian. The Aleuts, a branch of the Innuits, inhabit the Alaskan peninsula and the Aleutian Islands, and the Eskimos are found on the N. and W. coasts. Indian tribes occupy the interior and the S.E. The revenue of Alaska is gained by the issue of licences to trade in various articles; there is scarcely any other taxation. There are ample educational facilities, the University of Alaska, near Fairbanks, being maintained partly by Federal funds. The territory has its own legislative assembly of 16 senators and 24 representatives, which meets biennially at Juneau. There is a governor, appointed by the president of the U.S.A., who holds office for four years, and a delegate to Congress, elected every two years, though without power to vote. The principal

Alaska. 1. Sitka, the capital when Alaska was Russian, now an important U.S. naval seaplane base. 2. Indian woman curing fish. 3. Caribou-reindeer herd on the Lower Yukon. 4. Main street of Wrangell, the water-logged roadway paved with planks; on the right is a totem store. 5. Juneau, the capital and one of the principal seaports. 6. Eskimo natives in winter dress

owns, all small, are on the coasts; Juneau, the capital, has a population of 5,729, Ketchikan 4,695, Anchorage 3,495, Fairbanks 3,455, Sitka 1,987, and Nome 1,559. Alaska has little more than one person to each eight sq. m. The pop. at the census of 1940 was 72,524, of whom 39,170 were white. Bering, the Danish navigator (*q.v.*), first explored Alaska in 1741 and three years later it be-

came a Russian settlement. Its boundary dispute with Canada was finally settled by an international tribunal, which met in London in 1903.

Alaska, GULF OF. Opening of the N. Pacific on the S. coast of Alaska. It contains Kodiak and other islands, and in the N. the Kenai Peninsula forms the two arms of Cook Inlet and Prince William Sound.

Alaska Highway. First name given to the great U.S.-Canadian motor road, later known as the Alcan Highway (*q.v.*).

Alaskan Range. Chain of mts. in S. Alaska. It curves N.E. from the Aleutian Range to the Tanana valley, and culminates in Mt. McKinley, 20,300 ft. high.

Alastor. In Greek mythology, name applied to avenging deities who pursued sinners and

incited them to commit fresh crimes. It is an epithet of Zeus and the Furies, and is also used in the sense of a great sinner. Alastor, or the Spirit of Solitude, is the title of a poem by Shelley.

Ala-tau. District of Kazakh S.S.R., and name of several mt. ranges on the borders of Kazakh S.S.R., Kirghiz S.S.R., and Sinkiang. They form part of the Tian-shan system, N. and S. of the Ili, and their greatest height is nearly 15,000 ft. The Terskei Ala-tau runs S. of Lake Issyk-kul, in Kirghiz S.S.R.; the Kunghei and Trans-Ili Mts. stretch E. and W. on the N. side of the lake; and the Zungarian range, farther N., trends E. to W.

Alava. Southernmost and largest of the Basque provs. of Spain. Watered by the Zadorra, a tributary of the Ebro, it is largely mountainous, produces iron, copper, lead, marble, and timber, and contains several mineral springs. Cattle and sheep are reared, and maize, hemp, flax, and fruit grown. The area is 1,175 sq. m. and Vitoria is the capital. Pop. 116,090.

Alb (Lat. *albus*, white). Eccles. vestment of white linen, with openings at the neck and foot. It has tight sleeves, and reaches to the feet, being gathered at the waist by a girdle. In the Roman Catholic Church it is always worn under other eucharistic vestments by bishops, priests and deacons at Mass and frequently by acolytes, and it is often ornamented with pieces of embroidery called apparels. Its use in the Church of England, abandoned under Elizabeth, was revived partially in the 19th century. See Vestments.

Alb, decorated with apparels

Alba. Town of Italy, in Cuneo province. It is situated on the Tanaro, 42 m. by rly. S.E. of Turin. Its Gothic cathedral of S. Lorenzo was rebuilt after 1486, and it has a museum of local antiquities. Its chief trade is in wine, and silkworms are reared locally. It is on the site of Alba Pompeia, founded about 100 B.C. Pop. 13,740.

Alba, JACOBO MARIA DEL PILAR CARLOS MANUEL, 17th DUKE OF; FITZ-JAMES STUART, BERWICK, 10th DUKE OF (b. 1878). Spanish diplomat. Born Oct. 17, 1878, and educated at Beaumont, he

was Spanish minister of education, 1930, and foreign minister, 1930-31. A staunch monarchist, he continued to support the royalist party after the abdication of Alphonso XIII, but compromised with the Franco regime, and was Spanish ambassador to Great Britain, 1939-45. He resigned when the claimant to the Spanish throne, Don Juan, expressed disapproval of Franco's regime. See Alva, duke of; Berwick duke of.

Albacete. Prov. of S.E. Spain, formed of parts of New Castile and Murcia. Hilly and mountainous, with wide plains and fertile valleys, it is watered by the Júcar and Segura. Fruit is grown, stock rearing is a great industry, cutlery is manufactured, bees and silkworms are reared, and wine is made. Area, 5,737 sq. m. Pop. 390,333.

Albacete. City of Spain. Capital of Albacete province, 140 m. by rly. S.E. of Madrid, it is a large cattle-market, manufactures matches, and is famed for its knives and daggers. Pop. 74,565.

Albacore. Species of long-finned tunny (*Germo alalunga*) often about 3 ft. in length, particularly common in the spawning season off the S. coast of California, but also found in the Mediterranean and other temperate or tropical seas. See Tunny.

Alba Julia. Town of Transylvania, Rumania, formerly known as Karlsburg. It is situated on the Maros, 48 m. S. of Cluj (Kolozsvár). An historic town, it was the Roman Apulum, and later the capital of Transylvania. Pop. 12,457.

Alba Longa. First of Latin cities and mother city of Rome. Presumably it was situated on a ridge above the Alban Lake, 15 m. S.E. of Rome. Legend ascribes its foundation to Ascanius, son of Aeneas, some 300 years before the foundation of Rome. See Rome.

Alban. British saint and martyr. According to tradition he was born in the 3rd century at Verulamium, now known as St. Albans, and was converted A.D. 304 by a fugitive Christian priest whom he sheltered. Martyrdom quickly followed. A later version of the legend makes him a Roman soldier converted in Rome. His veneration in England dates from the 5th century, and the abbey of St. Albans was founded on the site of his martyrdom in 793. June 22 is S. Alban's festival, but the Church of England Calendar, in which it was placed in 1662, marks it June 17. See St. Albans.

Alban Hills. Group of volcanic mts. in Italy, E. of Rome.

Mons Albanus, now Monte Cavo (3,115 ft.), was the scene of military parades up to the temple on the top by Roman generals who were denied a triumphal entry into Rome. On the summits of the hills are small towns, including Albano, Frascati, Genzano, and Castel Gandolfo. Lakes Alban and Nemi lie to the S.

During the Second Great War the Germans established a strong defensive line in the Alban Hills in an attempt to protect Rome from the Allied advance in 1944. Heavy fighting occurred at the end of May, 1944, the Germans having made Frascati their chief garrison town. On June 3 American troops of the 5th army, within sight of Rome, drove the Germans from the important heights of Monte Cerraso and Colle Tano. The Germans were also compelled to abandon Monte Cavo. Other 5th army forces, advancing through the Alban Hills, captured Grottaferata (between Frascati and Lake Alban), Marino, and Genzano (on Lake Nemi).

Albanesi, MADAME (d. 1936). British novelist. Her name was Effie Henderson, and she was married to Chevalier Carlo Albanesi (d. 1926), a professor of music. As a novelist she gained early popularity and maintained a prolific output, some of her best-known titles being Peter, a Parasite, 1901; Susannah and One Elder, 1903; Capricious Caroline, 1904; The Brown Eyes of Mary, 1905; When Michael Comes to Town, 1917; The Green Country, 1927. She died Oct. 16, 1936. Her elder daughter, Meggie Albanesi, who died in 1923 at the age of 24, had already won distinction as an actress in emotional parts like those created by her in A Bill of Divorcement and East of Suez. A memoir, Meggie Albanesi, was published by her mother 1928.

Albani. Roman family, said to have come from Albania in the 16th century. Several members attained high ecclesiastical rank. Giovanni Francesco became pope in 1700 as Clement XI. His nephew Alessandro (1692-1779) was made a cardinal in 1721. A bitter opponent of the Stuarts, he used his influence with Pope Clement XIII to thwart Cardinal York's attempts to get his brother, Charles Edward Stuart, recognized by the pope as king of Great Britain. He built the Villa Albani, near Rome, where he formed a famous collection of antiquities, chiefly sculpture. Many of those were removed by Napoleon and

taken to Paris; they were restored in 1815. The present Albani collection contains some priceless examples of Greek sculpture. The family became extinct in 1852.

Albani, FRANCESCO (1578-1660). Italian painter. Born at Bologna, March 17, 1578, he studied under Denys Calvaert, the Flemish painter, and followed Guido Reni, one of his fellow pupils, to Rome. His most famous works are a fresco of Children in the Colonna Palace, Rome; Europa and the Bull in the Torlonia Palace, also in Rome; and the quartet of allegories representing the Four Elements, painted for Cardinal Maurice of Savoy. He died at Bologna, Oct. 4, 1660.

Francesco Albani, Italian painter

Albani, MADAME (1852-1930). Professional name of Marie Louise Cécile Emma Lajeunesse, soprano singer. Born Nov. 1, 1852, near Montreal, of French-Canadian parents, and educated at Albany, New York (hence the name Albani), at the age of 15 she was organist of the Church of the Sacred Heart, New York. After studying in Paris and Milan, she made her début in 1870 at Messina as Amina in La Sonnambula, and appeared first in London in 1872. She was for many years the leading soprano in opera and oratorio. In 1878 Mme. Albani married Ernest Gye. She was made D.B.E. in 1925. She retired in 1911, and died April 3, 1930. Consult her memoirs, *Forty Years of Song*, 1911.

Madame Albani, soprano singer

and hardy, and make splendid soldiers.

The principal towns are Tirana, the capital, Durres (Durazzo), Scutari, Koritza (Korçe), Elbasan, Vlonë (Valona), and Berat. The ports are Durazzo, Valona, Shenghin, and Saraudë (renamed by the Italians Porto Edda).

HISTORY. The early history of Albania is obscure, but in Roman-Byzantine times the upper portion of the country was included in the province of Illyria, the lower in that of Epirus. From Dyrrachium, the ancient forerunner of the modern Durazzo, stretched the great Via Egnatia, Rome's road to the East by way of Elbasan and Ochrida. Albania shared the vicissitudes of southern Europe on the collapse of the Byzantine Empire, and in 1748 became a province of Turkey. Before that its people had adopted Christianity, but most of them turned Mahomedan afterwards. In the N. the Mirdites and other tribes are Roman Catholic, and in the S. some belong to the Greek church, but about two-thirds of the population are Mahomedan.

In spite of many rebellions, in the course of which it nearly became independent, Albania remained under the Turks until, as a result of the First Balkan War, it was constituted an autonomous state by the Great Powers in 1912-13. By the Treaty of Berlin, 1878, it had already been reduced in area, parts being given to Austria, Montenegro, Serbia, and Greece; and the provisional frontiers assigned to it in 1912-13 by the London Conference indicated a further loss of territory.

The First Great War

In July, 1913, the London Conference created an international commission of control for Albania, and decided that a European prince should rule over the country. An Albanian deputation offered the crown to Prince William of Wied in February, 1914, and he arrived at Durazzo the following month, being styled mpret, a corruption of *imperator*. But when Austria declared war on Serbia on July 28, William, with most of the members of the international commission, left Albania to look after itself, whereupon its condition became anarchic. An attempt to set up a military government failed in a few weeks. In Nov., 1914, Greece occupied N. Epirus, though formal possession was not claimed until 1916, and even then went unrecog-

ALBANIA: BALKAN LAND OF CONFLICT

Robert Machray, Writer on Foreign Affairs

The story of a small country of such strategic importance to other powers that it has rarely enjoyed a real independence. See also Balkan Wars; Italy; Greece; Adriatic; and under the names of towns, e.g. Tirana; Durazzo; Valona

Albania is a mountainous country on the W. side of the Balkan peninsula, with an area of about 11,000 sq. m. It is bounded on the N. and E. by Yugoslavia, on the S. by Greece, and on the W. by the Adriatic. The name is derived from the word *alb* or *alop*, white; but the inhabitants, Gheqs in the N. and Tosks in the S., call it Shquiperia. The population at the census of 1930 was 1,003,124.

For the most part the land is a wild tangle of mountains, a continuation of the Alpine ranges of Bosnia and Dalmatia, and of high valleys watered by small, swift streams, chief of which are the Drin, Boyana, Shkumbi, Semeni, Devoli, and Vjosoë. In the centre a certain extent of the plateau is cultivable, and in the S. there is fertile alluvial land in the river valleys, with grazing land on the slopes. The coast is marked by rocky headlands, swamps, and lagoons, with some arable land.

There is little agriculture, but in a few districts fair crops of maize are raised, and olives, vines, mulberries, and other fruits are grown. Their flocks and herds provide the main subsistence of the people. Albania has little outside trade. One of the chief exports is bitumen from Selenitza in the Vjosoë valley. An Italian

company has worked the oil deposits in the Devoli basin. The great majority of the inhabitants are only half civilized, yet they obey rough laws and codes of their own, including the vendetta, or blood-feud, under tribal leaders whose position resembles that of the old Scottish Highland chiefs. In general the people are brave

Albania. Mountainous country on the eastern shore of the Adriatic Sea

Albania. 1. Main square in Tirana, with modern hotels and a motor omnibus (right) about to start. 2. Street in Scutari, showing the market on the left and bazaars on the right. 3. Dwellers in the mountains, some clad in sheepskins, on a visit to Tirana. 4. Women of Durazzo gossip round a well. 5. Fine type of old man from the E. borders

nized by the Great Powers. Meanwhile disorder continued.

Italy declared war on Austria in May, 1915. In previous negotiations Italy had demanded Austria's recognition of her claim to Valona and the renunciation of all Austrian claims in Albania. Austria refused, and on Dec. 15, 1915, Italian troops landed at Valona and at other points in S. Albania. The Austrians, after their conquest of Montenegro in Jan., 1916, advanced southwards into Albania in pursuit of the Serbians. But by this time the Serbians had escaped to Corfu in Allied ships, and a large Italian force was concentrated at Valona, with outposts as far N. as the Vijose, where they were in contact with Austrian advance guards. In June, 1917, Italy proclaimed Albania to be under her protection. Austria promptly retaliated by announcing her own protectorate of the country.

After a year of intermittent fighting, the Italians pushed northward, and, in conjunction with French troops, reached the Semeni and the Devoli valley and took Berat. On the capitulation of Bulgaria in Sept., 1918, the Austrians gradually withdrew, and all Albania was occupied by the Italians in Oct.-Nov. They remained there after the end of the war, but in the summer of 1919 their rule was challenged by an armed movement aiming at complete independence. The leader of the movement, Essad Pasha Topdani, was murdered in 1920, but an independent government was established at Tirana in Feb., 1920, and in June the Italians were forced back into Valona. This independence was confirmed by the Supreme Council of the Allies in Nov., 1921, also the pre-war boundaries with certain modifications. Nominally a constitutional monarchy, the coun-

try was ruled for a time by a council of four regents. But on Jan. 22, 1925, Ahmed Zogu, a former premier, contrived a *coup d'état*, and Albania was proclaimed a republic, with Zogu as president. In 1928 a constituent assembly declared for a monarchy, and Zogu became king under the name of Zog (q.v.). At the start he owed much of his success to Yugoslav help, but later he appeared to forget this fact and orientated his policy towards Italy. Italian influence, political and economic, continued to grow, and treaties were made with Italy in 1926 (the Treaty of Tirana) and 1927 (an amplification of the former Treaty into a military alliance) which purported to consolidate the *status quo*. In reality Albania became a protectorate of Italy.

On April 7 (Good Friday), 1939, Italian troops invaded Albania without warning and drove out Zog. A few days later the king

of Italy was proclaimed king of Albania, and a new constitution was decreed which placed supreme power in the hands of the king and a supreme Fascist corporative council after the Italian model. Foreign policy was declared to be the preserve of Italy.

In Oct., 1940, after Italy had joined in the Second Great War as an Axis partner of Germany, an Italian army invaded Greece from Albanian soil, only to meet the most humiliating reverses. By Nov. 19 the invaders had been ejected from Greece, and southern Albania became a battlefield. The Greeks captured Koritza (Nov. 22) and Argyrokastron (Dec. 4), and by April, 1941, the battle-front ran from the coast about 20 m. S. of Valona to Lui, near the W. shore of L. Ochrida. But on April 23 the Greek army in Albania was involved in the surrender of the Epirus army, and the whole country reverted to Italian occupation, though increasing reliance was placed upon the superior strength of the German armies.

The collapse of Italy in the autumn of 1943 seriously weakened the Axis position throughout the Balkans, and though the Germans still retained their stranglehold upon the country the efforts of the Albanian partisans to free their land from the conqueror were to prove successful. In April, 1943, a British military mission began to operate in Albania. Led by Brig. E. F. Davies (subsequently in command of Land Forces Adriatic), this force formed and trained an army of some 20,000 Albanian partisans, and when at the end of Sept., 1944, the Germans started to withdraw, the partisans occupied many villages and important centres and harassed their retreat. Allied planes bombed strategic targets, disrupting lines of communication, thus assisting the partisans to liberate territory that had been seized by Italians or Germans. The Germans evacuated Tirana Nov. 18, 1944, partisans occupying it a few days later. Albania was declared a republic on Jan. 11, 1946, the king not having returned. For later information see N.V.

Alban Lake or **LAGO DI CASTELLO**. Small crater lake of central Italy, 15 m. S.E. of Rome. About 6 m. in circumference, it is at an alt. of 960 ft. and is about 560 ft. deep. Forbidding and sombre in aspect, it is fed by subterranean springs and drained by a

sluice and channel cut, according to Livy, by the Romans in 396 B.C. On its banks are Castel Gandolfo, with a papal palace, a château, now a convent but formerly a summer resort of the popes, the ruins of a villa of Domitian, and the town of Albano.

Albano. Town of Italy. On the S. slope of the Alban Hills, 15 m. S.E. of Rome, it is 1,230 ft. above sea level, and has remains of ancient buildings, including a house of Pompey and villas of the emperors Tiberius, Caligula, and Nero. It is now a summer resort and the seat of a bishop, and gives its name to a wine. In the Second Great War, when the Allied 5th army advanced through the Alban

Hills towards Rome, Albano was captured from the occupying Germans during the opening days of June, 1944.

Albany or **ALBAN**. Early name for that part of Scotland N. of the Forth and Clyde. Later, about 900, it referred to a district, formerly called Pictland, between the Forth and Clyde and the Spey. This had its own kings for about a century, and was afterwards the nucleus of the kingdom of Scotia, later Scotland. The word is a variant of Albion, probably the earliest name for the British Islands.

Albany. River of Canada. Formerly part of the boundary between Ontario and the Keewatin district, it is now wholly within the former. Rising in Lake S. Joseph, it flows about 450 m. E. and N. and empties at Fort Albany into James Bay.

Albany. Town of W. Australia, in Plantagenet county. On Princess Royal Harbour, King George Sound, 352 m. by rly. S.E. of Perth, it is a popular health resort by reason of its equable climate and fine scenery. Though its harbour is one of the best in Western Australia, it has been superseded by Fremantle. It is a port of call for S. African mail boats, and has brewing and leather industries. Pop. 4,000.

Albany. District in the S.E. of Cape Province, S. Africa. It was first settled during the administration of Lord Charles Somerset by 3,500 emigrants, who landed at Algoa Bay in 1820. These settlers formed the first considerable

body of emigrants assisted by the British government, and were a rampart against the incursions of the Kaffir tribes. Its area is 1,685 sq. m. and its capital is Grahamstown. Pop. 38,800.

Albany. City of the U.S.A., capital of New York State and of Albany county. It stands on

Albany, New York. The Education Building, in which are housed the State library and museum; above, the State Capitol

the W. bank of the Hudson river, 145 m. N. of New York City. An important industrial and commercial centre, its manufactured products cover an extensive range. The city has excellent railway facilities and river communication, as well as a municipal airport. The city owes its importance almost entirely to its situation at the fork of the valley-way from New York, one branch going W. to the Great Lakes, the other N. to Montreal. Its many handsome public buildings include the state capitol,

the city hall, the state hall, state museum, and many colleges and schools. There are also many fine examples of Dutch colonial building. Formerly a Dutch settlement, Albany was ceded to Great Britain in 1664, and named after the duke of York and Albany, afterwards James II. It was granted a charter in 1686, and in 1754 the first provincial congress met here to arrange the union of the colonies. In 1797 it became the state capital. Pop. 130,577

ALBANY, CONVENTION OF. Assembly of representatives from seven of the American colonies—Massachusetts, Connecticut, New Hampshire, Rhode Island, Pennsylvania, Maryland, and New York. In 1754 war between Great Britain and France was imminent, and the promoters of the conference desired a closer union between the colonies and the strengthening of their alliance with the Indians of the Five Nations. It was arranged with the Indians that they should take part in the war, and Franklin proposed a plan for a union of the colonies under a president-general, appointed by the English king, and a council of representatives. The convention approved the plan, but it was rejected by both the authorities in London and the colonists themselves. See Rise of the Republic. R. Frothingham, 1872.

ALBANY, COUNT OF. Title successively assumed by two brothers who claimed descent from Charles Edward Stuart, the Young Pretender. According to their own account this was through a son, born in 1773, of Louisa, countess of Albany. The elder, John Sobieski Stobberg Stuart (1797–1872), and the younger, Charles Edward Stuart (1799–1880), styled themselves variously Allan, Stuart Allan, Allan Stuart, Hay Allan, Hay Allan Stuart, Stuart Hay Allan. Their real name was Allen, their father being Thomas Allen, a naval officer. They fought for Napoleon at Dres-

den and Leipzig and perhaps at Waterloo. Their writings include *Tales of the Century*, *Vestiarium Scoticum*, a work on clan tartans, and *Lays of the Deer Forest*. They were buried at Eskdale, near the shooting-box on Eilean Aras built for them by Lord Lovat.

ALBANY, DUKE OF. Scottish title. The first duke was Robert, a brother of Robert III, king of Scotland, who was given the title in 1398. Some years later it became extinct, but was revived about 1450 for Alexander, a younger son of James II. In 1536 it again became extinct, when John Stewart, the 2nd duke, died. John was regent of Scotland during the minority of James V, and was a friend of Francis I of France. Lord Darnley, the husband of Mary Queen of Scots, was created duke of Albany in 1565, and from him the title passed to James I and the succeeding Stuart kings, and was claimed by the exiled descendants of James II. Ernest Augustus, a brother of George I, and Edward Augustus, a brother of George III, were in turn created duke of Albany, and both died without heirs, as also did the next duke, Frederick, a son of George III. In 1881 this ancient title was revived and bestowed by Queen Victoria on her youngest son, Prince Leopold.

ALBANY, LEOPOLD, DUKE OF (1853–84). Youngest son of Queen Victoria. He was born at Buckingham Palace, April 7, 1853, and studied at Oxford in 1872–6. Made a privy councillor in 1874, in 1881 he was created duke of Albany. In 1882 he married Helen Frederica Augusta, princess of Waldeck-Pyrmont, by whom he left a son and a daughter. He died at Cannes, March 28, 1884.

Prince Leopold,
Duke of Albany
Downey

His daughter Alice Mary was married in 1904 to Prince Alexander of Teck, afterwards earl of Athlone. His son, Leopold Charles, succeeded his uncle as duke of Saxe-Coburg in 1900, when he renounced his British nationality. During the First Great War, as a German prince he fought against Britain, and was deprived of his British titles in 1919.

ALBANY, LOUISA, COUNTESS OF (1752–1824). Wife of Charles Edward Stuart, the Young Pretender. Louisa was the eldest daughter of Prince Gustavus Adolphus of

Louisa, Countess
of Albany
Nat. Port. Gallery

Stohlberg-Gedern, and was born at Mons, Sept. 20, 1752. In 1772 she married Charles Edward Stuart, who styled himself count of Albany, but the union was childless and unhappy, and in 1780 she fled for protection to her brother-in-law, Cardinal York. In 1784 she was separated from her husband, who died four years later. After travelling with the Italian poet Alfieri she settled at Florence, where she died Jan. 29, 1824. Among her friends she numbered the French painter François Xavier Fabre of Montpellier, to whom she bequeathed all her property. Consult *The Last Stuart Queen*, H. M. Vaughan, 1910; *Louise of Albany*, G. R. Preedy, 1945.

ALBANY, THE. Building on the N. side of Piccadilly, near Burlington House. Erected on the site of Sunderland House, it was known as Piccadilly House until 1770, when Lord Holland sold it to Viscount Melbourne, by whom its name was changed to Melbourne House. He exchanged it for a mansion in Whitehall with the duke of York and Albany, after whom it was renamed and let out first as bachelors' chambers and more recently in flats. Byron, Lytton, and Macaulay are among the distinguished men who have resided there at one time or another. Modern residents usually prefer to speak of the building as Albany, omitting the definite article. Consult *Evenings in Albany*, C. Bax, 1942.

ALBATROSS. Name given to the genus *Diomedea* of the zoological order Tubinares, or tube-nosed birds, which includes the petrels. All birds of this order have the nostrils produced into tubes, which lie on the upper surface of the beak. Albatrosses are the largest marine

Albatross. Largest of the sea birds, and remarkable for the speed with which it can fly and for the long period during which it can keep on the wing

birds and are famed for strength of wing. When the wings are folded they give no suggestion of their size, and the bird looks not unlike a goose with a long bill; when extended they often measure 12 ft. from tip to tip. The bird itself only weighs from 16 lb. to 18 lb. Its plumage is white with a slight yellow tinge, barred irregularly with black on the wing coverts and sometimes on the back. The nostril tubes are placed wide apart on the sides of the beak, which is about six inches in length and sharply hooked at the tip. The feet are webbed, and the bird is a strong swimmer.

Except in the nesting season, the albatross spends all its time at sea and most of it on the wing. It will keep up for days together with a ship making 200 m. a day. It seems to glide along for astonishing distances without moving its wings, but if closely watched when on a level with the eye, it will be seen that extremely quick and short movements of the wings are constantly taking place.

The albatross is a native of the southern tropical and sub-tropical seas, but one species is sometimes found as far N. as Alaska. It nests in vast colonies on rocks and islands of the South Pacific Ocean, and Tristan da Cunha is one of its favourite places. It makes a round raised nest of clay and grass, about 14 ins. in diameter, and in the case of the smaller yellow-billed species lays a single white egg about the size of that of a goose. The egg of the wandering albatross is 5 ins. in length, speckled with red. These eggs are collected for the oil they contain. An old superstition of sailors that ill-luck attended the killing of an albatross at sea is the theme of Coleridge's poem *The Ancient Mariner*. The name is derived from the Portuguese *alcatraz*, pelican or cormorant, ultimately from the Arabic *al qadus* (bucket), the pelican being supposed to carry water in its pouch.

Al-Battani, Latinised as **ALBATEGNIUS** (c. 850-930). Arab prince and astronomer. Born at Batan, Mesopotamia, his observations were made for the most part at Rakka, whence he is sometimes known as *Mohamedes Aractensis*. He calculated the length of the solar year with great exactitude, and worked out tables for the movements of the planets. Astronomy owes to him the first numerical calculation of the eccentricity of the earth's path, as well as the discovery of the variation of the apsidal of the earth's orbit towards the signs of the Zodiac. He revised

Ptolemy's *Almagest*, and rendered service to trigonometry by the introduction of the use of sines in mathematical computations.

Albay. City of Luzon, Philippine Islands, also known as Legaspi. The capital of Albay prov., it stands on Albay Bay and is a centre of trade in hemp, cocoa, copra, and coconut oil. Coal mining is carried on. The prov. (about 1,000 sq. m.) is thickly wooded and fertile, and has gold and silver mines. Pop. 33,000.

Albedo (Lat. whiteness). Scientific term for the degree of reflected light of a planet or other member of the solar system, the light being that of the sun. The light reflected by the moon from the sun is the albedo of the moon. The moon's albedo is represented by the fraction 0.07. See *Light*.

Albemarle, **EARL OF**. British title, derived from the French town Aumale. It dates from the Norman Conquest, and has been revived at least four times. William de Fortibus (d. 1242), the rebel baron; Thomas, younger son of Henry IV; and Richard Beauchamp, earl of Warwick (d. 1423), are among the earlier earls of Aumale or Albemarle. The title was in abeyance for 200 years until Charles II conferred the dukedom of Albemarle on General Monk in 1660, and it expired on the death of his son Christopher, the 2nd duke, in 1688. William III, by making his Dutch favourite the soldier Arnold Joust van Keppel (d. 1718) earl of Albemarle, gave the title to the family of Keppel, by whom it has been borne to the present time. The 6th earl, George Thomas (1799-1891), who fought at Waterloo, was later a Liberal M.P., 1847-49, and succeeded to the title in 1851. The 9th earl, born 1882, succeeded in 1942.

Albemarle, **GEORGE MONK OR MONCK**, 1ST DUKE OF (1608-70). English soldier and politician. Born at Great Potheridge, Devon, Dec. 6, 1608, in early life he served in campaigns against France and Spain. About 1630 he crossed over to the Netherlands, where his reputation as a soldier was made. Returning to England about 1638, in time to help Charles I against the Scots and in Ireland, he remained in Ireland until 1644, when he returned to England, was taken prisoner at Nantwich, and passed the next two years in the Tower.

In 1646, released to become a soldier of the Parliament, he returned to Ireland. A successful governor of Ulster, in 1649 he

displeased the Parliament by making terms with the Irish, thus enabling some of his men to serve Charles II. Cromwell, however, believed in him; he held a command at Dunbar and remained to complete the subjugation of Scotland after his leader's departure for Worcester. Made a general at sea, Monk was one of the English commanders in the two victories of 1653 over the Dutch, but was soon on land again, fighting against the Royalists in Scotland. He was still in Scotland when Cromwell died, and was then approached by the agents of Charles II. Cautious as ever, it was only after the fall of Richard Cromwell that he became a political leader.

In 1659 he spent some time in futile negotiations with the leaders of the army, and on Jan. 2, just after the restoration of the Long Parliament, he entered England. Lambert's rival army having dispersed, he marched

George Monk,
1st Duke of Albemarle

unmolested to London. When, on Feb. 3, Monk entered the city, he had under him the only effective and disciplined force in the country, and his position was that of dictator. He restored the members excluded from the Long Parliament in 1648, and then, having been made commander-in-chief in England, Scotland, and Ireland, declared for the restoration of Charles II.

In 1660, the returned king made his benefactor duke of Albemarle and heaped other honours upon him. In 1664 Monk again held a naval command, which he gave up to look after London during the Plague. In June, 1666, he was one of the commanders of the fleet in the battle with the Dutch in the Downs. He died Jan. 3, 1670, and was buried in Westminster Abbey. About 1652 he had married Anne Clarges.

His son Christopher, who succeeded to the dukedom, was known previously as earl of Torrington. In 1675 he was made lord-lieutenant of Devonshire and he succeeded Monmouth in command of the Horse Guards, being active in raising men to serve against that invader in 1685. He was chancellor of the university of Cambridge, and was governor of Jamaica when he died in 1688.

Bibliography. Lives: T. Gumble, 1671; Julian S. Corbett, 1889; O. Warner, 1936; Honest George Monck, J. D. G. Davies, 1936; Christopher Monck, 2nd Duke of Albemarle, E. F. Ward, 1915.

Albemarle Sound. Shallow inlet on the N.E. coast of North Carolina, U.S.A. About 60 m. long, with a breadth of from 4 m. to 16 m., it is generally unnavigable except where dredged.

Albemarle Street. London thoroughfare running N. from Piccadilly to Grafton Street. It owes its name to George Monk, 1st duke of Albemarle, who had a residence here, Clarendon House, demolished about 1683. The street contains shops and clubs, but its most interesting buildings are No. 50, the publishing house of John Murray, famous for its associations with Lord Byron; the house of the Royal Asiatic Society; and that of the Royal Institution.

Albendorf. Village of Silesia. On the Cedron, 50 m. S.S.W. of Breslau (Wrocław), it was famous as a place of pilgrimage from 1200. It has a beautiful 18th century church on the model of the temple at Jerusalem, a Calvary, and an image of the Virgin. Before the First Great War this place, with fewer than 2,000 inhabitants, was visited yearly by about 100,000 pilgrims. It is in the part of Germany placed under Polish administration in 1945.

Albenga. Town and seaport of Italy, in the prov. of Savona. The seat of a bishop, it is on the Gulf of Genoa, 52 m. by rly. S.W. of Genoa. On the site of the ancient Albingaunum, chief town of the Ligurian tribe of the Ingauni, it was rebuilt by Constantius in 354. Containing a Gothic cathedral and ruins of medieval châteaux, with Roman remains in the vicinity, it is perhaps the most picturesque town on the Riviera. Pop. 6,882.

Alberche. River of Central Spain. Rising N. of the Sierra de Gredos, it flows about 150 m. E. and S.W. to the Tagus near Talavera.

Alberni. Town and port of Vancouver Island, Canada. It stands at the head of the Alberni

Canal, 58 m. W.N.W. of Nanaimo, and is the terminus of branches of the C.P.R. and the C.N.R. to Victoria. From here steamers go to Victoria and elsewhere. Its industries are connected with lumbering, sawmills, and fish curing. Pop. 2,054.

Alberoni, GIULIO (1664-1752). Italian prelate and Spanish statesman. Born at Firenzuola, near Piacenza, of humble parents, he

Giulio Alberoni

was ordained and became secretary to the duke of Vendôme. After varied diplomatic experiences he was in 1713 sent by the duke of Parma to Madrid. He negotiated the marriage of Philip V with Elizabeth Farnese in 1714, and in the same year became prime minister, being made a cardinal in 1717. He did much to revive Spanish commerce and to organize the Spanish army and navy, but found little favour with the nobles. His aggressive foreign policy resulted in 1719 in the Quadruple Alliance between England, France, Austria, and Holland, and his banishment from Spain. He died at Piacenza, June 16, 1752.

Albert. River of N. Queensland. It is formed by the junction of the Nicholson and Gregory rivers and flows past Burke Town to the Gulf of Carpentaria.

ALBERT OR ALBERT NYANZA. Lake in East Central Africa. Since 1910 the eastern side has formed part of the British protectorate of

Uganda, the western side being attached to the Belgian Congo. It is about 80 m. N.W. of the Victoria Nyanza. It is 100 m. long and 25 m. broad, has an area of 1,650 sq. m., and is situated 2,028 ft. above sea level, but 1,000 ft. below the general level of the surrounding country. The Victoria Nile empties into the N.E. corner and the White Nile issues from its N. extremity. At its S.W. end it receives the Semliki, the outlet of Lake Edward. The Albert Nyanza is shallow, the average depth being 30 to 40 ft., and is likely to become more so through the heavy alluvial deposits of the two tributary rivers. The situation of the lake was first announced by Speke and Grant in 1862, but it was first visited by Sir Samuel Baker in 1864. Steamers run between Butiaba, Mahagi, Wadelai, and Dufilé.

Albert. Town of France, in the department of Somme. It stands on the Ancre, 18 m. N.E. of Amiens and 11 m. S.W. of Baupême, and has paper, cotton, and other industries. Formerly known as Ancre, it received its present name on its presentation to Charles d'Albert, duke of Luynes, by Louis XIII. The church of Notre Dame de Brebières became famous during the First Great War for its so-called hanging Virgin, a gilded figure of the Madonna and Child, which fell into a position 15 degrees below the horizontal during the early operations and remained thus until March, 1918, when it fell. In Oct., 1914, the German lines were drawn 2 m. E. of the town.

Albert. The cathedral as damaged early in the First Great War, showing the hanging statue of the Virgin. It was later restored

which was occupied March 27, 1918, and recaptured in ruins by the Allies Aug. 22, 1918. In the Second Great War the restored town was under German control from June, 1940, until liberated by the Allies at the end of Aug., 1944. Pop. (pre-war) 7,345.

Albert, BATTLE OF. Fought between the French and the Germans, Sept. 20–30, 1914. Towards the close of the first battle of the Aisne (*q.v.*) part of the 2nd French army under Castelnau was moved from Lorraine to the extreme Allied left on the Oise, and with several Territorial divisions was formed into the 7th army. On Sept. 20 it began operations against the flank of the German forces and Kluck's army, and at first made rapid progress. The Germans were also moving men to this flank, having probably been informed of the French intentions by their secret service, but they were not as yet ready to meet Castelnau. He captured Noyon on Sept. 21 and pressed forward towards the important rly. junction of Tergnier, W. of La Fère, while other sections of his army reached Lassigny, Roye, Péronne, and Bapaume.

On Sept. 25, however, troops of Prince Rupert's army (6th) arrived from Lorraine and attacked on a wide front from Noyon to Péronne. Probably because of the shortage of ammunition, which hampered the French artillery all through the earlier period of the war, and because of the superiority of their numbers and their communications, the Germans were able to force Castelnau back after a prolonged struggle. On Sept. 26 he held a line from Ribécourt through Roye, Lihons, W. of Chaulnes, Bray, and the high ground E. of Albert, and here again he was attacked. The Germans hoped to turn the French flank and thus compel Joffre to retire from the Aisne, while Joffre was seeking to force back the German armies by exactly the same manoeuvre.

Albert was bombarded by the German artillery from the high ground of Thiepval and what was afterwards the Somme battlefield. At Lihons, Castelnau's centre inflicted heavy loss on the Germans, but could not gain ground or recover Péronne. At Roye a dangerous salient was driven into the French front.

To meet the growing strength of Prince Rupert's forces, now augmented with the arrival of most of Bulow's army, Joffre

brought up a new French army, the 10th, under Gen. Maud'huy, which came into line N. of Albert, prolonging the Allied front N. as far as Arras. Castelnau's army became the pivot on which Joffre endeavoured to swing his forces inward against the German communications, and as troops were constantly diverted to the exposed flank by both combatants, the front from Albert to Noyon was entrenched by both. There was no substantial change on this section of the line until the German retreat of 1917, after the Somme.

H. W. Wilson

Albert. English form of a popular masculine Christian name. In German it is Albrecht. It is of Teutonic origin and comes from two words meaning noble and bright. Early forms were Adelbert and Adelbrecht in Germany and Ethelbert in Anglo-Saxon England. In England it was not much used after the Norman Conquest, but in Germany it was very common and, in the form of Albrecht, was borne by many kings and princes. After Albert of Saxe-Coburg married Queen Victoria it became, in this form, popular in England. The same form is used in France. The feminine equivalent is Alberta.

Albert, known also as THE PRINCE CONSORT (1819–61). Husband of Queen Victoria and father of her successor, Edward VII. He was the younger son of Ernest, duke of Saxe-Coburg-Gotha, and was born at Schloss Rosenau, near Coburg, August 26, 1819—three months after the princess Victoria, who succeeded to the throne of Great Britain in 1837—being christened Francis Charles Augustus Albert Emanuel. Necessities of state demanded that the young queen should marry, and Albert appeared to be a suitable candidate for her hand. They were married on Feb. 10, 1840.

As the prince consort—a title conferred on him in 1857—Prince Albert occupied a somewhat anomalous position, having no status in the constitution; at the same time he soon became the queen's most intimate personal counsellor. But his influence over her was used with discretion and moderation. He learnt to adapt himself and his advice to English constitutional conditions, although at first he was suspected of encouraging in his wife continental ideas of the functions of royalty. His knowledge of continental politics was exceptionally thorough, and this greatly enhanced the value of his coun-

Albert

sels. Under other conditions he might well have taken high rank as a statesman, but his statesmanship could be displayed only indirectly. Prince Albert, however, had received a model education: he had been taught everything that a prince ought to be taught; he was interested in everything in which a prince ought to be interested. Music, painting, letters, science, industries and social improvement all came within the sphere of his versatile activities, or at least of his intelligent patronage; and he was a prime mover in the organization of the Great Exhibition of 1851. The prince died of typhoid fever at Windsor Castle, Dec. 14, 1861, and was mourned by Queen Victoria for the rest of her long life. *Consult* Life, Sir T. Martin, 5 vols., 1875–80; Letters of Queen Victoria, 1837–61, ed. A. C. Benson and Viscount Esher, 3 vols., 1907. The prince is also treated in considerable detail and with some sympathy in Queen Victoria, Lytton Strachey, 1921.

Albert (1875–1934). King of the Belgians. Born at Brussels, April 8, 1875, he was the second son of Philip, count of Flanders, a younger brother of the Belgian king, Leopold II. He was educated for the throne and after his father's death in 1905 was known as the count of Flanders. He passed some time in travelling, visiting the U.S.A. and the Belgian Congo, as well as regions nearer home. In Dec., 1909 he became king of the Belgians on the death of Leopold. He had ruled his country successfully for nearly five years when he and his government were presented, in Aug., 1914, with Germany's ultimatum. They decided to maintain the

neutrality of Belgium and at once their country was invaded and quickly overrun. The king bore these misfortunes with a dignity that won for him the respect of Europe. Both his sons were sent to England to be educated, his Government was removed to Le Havre, and he himself took his place as commander of his army in the field. In Sept., 1918, he took command of an Allied army—containing Belgian, British and French troops—which recaptured the Belgian coast by Oct. 20.

After the Allied victory the king re-entered Brussels in triumph on Nov. 22, 1918. Thereafter he devoted himself to the rebuilding of his country's economic and social life. His broad human sympathies had a

Albert

marked influence on Belgian culture. He was keenly interested in the development of aeronautics. But it was his great fondness for mountaineering and rock-climbing that led to his death. While climbing a crag in the Ardennes, Feb. 17, 1934, he slipped and was fatally injured. He was succeeded by his eldest son, the duke of Brabant, who became Leopold III (*q.v.*).

Albert had married in 1900 Elizabeth, daughter of the duke Charles Theodore of Bavaria. They had three children, Leopold (b. 1901), Charles (b. 1903), and Marie José (b. 1906; m. the crown prince of Italy, 1930).

Albert I (c. 1250–1308). German king. Eldest son of Rudolph I of Hapsburg, he passed his early days in governing his hereditary lands on the Rhine. In 1292 he swore allegiance to King Adolf of Nassau, but in 1298 defeated him at Göllheim and was himself

elected and crowned as his successor. He failed in efforts to annex Holland and Zeeland to Germany and was defeated in an attack on Thuringia, but he suppressed the league against him. He was murdered at Windisch, May 1, 1308, by his nephew John of Swabia.

Albert (1414–86). Elector of Brandenburg, who was surnamed Achilles. The younger son of the elector Frederick I of Hohen-zollern, in 1440 he succeeded to the principality of Ansbach, in 1464 became prince of Bayreuth by the death of his brother John, and in 1470 elector of Brandenburg by the abdication of his brother Frederick II. Two years later he added Pomerania to his dominions. A powerful warrior and ruler, by his issue of the so-called Dispositio Achillea in 1473 he established primogeniture for the mark of Brandenburg. He died at Frankfurt, March 11, 1486.

Albert (1522–57). Margrave of Brandenburg-Kulmbach. Belonging to the Hohenzollern family, and surnamed Alcibiades, he was born at Ansbach, March 28, 1522. After fighting for Charles V, he joined Maurice of Saxony against Charles, but later returned to the emperor's service. In July, 1553, he was defeated by Maurice at Sievershausen, and in Dec., 1553, was placed under the imperial ban and fled to France. He died at Pforzheim, Jan. 8, 1557.

Albert (1490–1545). German prelate. The younger son of John Cicero, elector of Brandenburg, he was made archbishop of Magdeburg in 1513. In 1514 he secured the archbishopric of Mainz, one of the seven electorates of the empire, and in 1518 was made a cardinal.

Albert (1490–1568). Duke of Prussia. The third son of Frederick of Hohenzollern he was elected grand-master of the Teutonic order in 1511. Having failed in his attempt to relieve the order from the suzerainty of Poland, he turned Lutheran, secularised Prussia, and in 1525 had it converted into a duchy hereditary in his family and still subject to Poland. This cost him his grand-mastership, but was important for the development of the Prussian monarchy. In 1544 he founded the university of Königsberg. He died at Tapiau, March 20, 1568.

Alberta. Province of the Dominion of Canada. Originally one of the four districts of the North-West Territory, it received its present status in 1905, including about half the former district

of Athabaska and small portions of Assiniboia and Saskatchewan.

Alberta. Arms of the province

W. by the Rocky Mts. and British Columbia. The length from N. to S. is 760 m., the mean breadth from E. to W. 255 m., and the area 255,285 sq. m.

Three large river systems, the Saskatchewan, Athabaska, and Peace, with their tributaries, traverse the plains. The lakes, though covering 6,485 sq. m., are insignificant apart from Athabaska and Lesser Slave. The climate, influenced by warm chinook winds from the Pacific, exhibits great seasonal variation, for summer temperatures exceed 90° F. in the S.E. and winter temperatures range from 40° F. above to 30° F. below zero. Rainfall is scanty except in the centre, and irrigation has been necessary in the S., much of which is treeless prairie. N. of this is a region of grassland with poplar woods, and farther N. again are larch, spruce, and cottonwood, the area under forest being 159,000 sq. m. The national parks include 8,000 sq. m. of forest, that of Jasper being the biggest in the world.

In the 19th century Alberta consisted of a vast ranching country. Now, though horse-breeding is still profitable, agriculture is the chief industry, and of a population of 796,169 in 1941, 489,583 lived on farms. Four-fifths of the non-forested land is classified as patient of agricultural development, but only a quarter is already cultivated. Wheat and oats are the principal crops.

Manufactures and minerals are of increasing importance. Alberta's coal reserves total 87 per cent of those of Canada and 14 per cent of the world's. The province is the second largest oil producer in the British Empire; nearly 10 million barrels came from the gas in Turner Valley in 1941, while the McMurray area contains the largest visible supply of bituminous sand in the world. At Waterways are salt deposits expected to yield 500,000 tons to the acre. Packing plant production was valued at \$67,200,000 in 1943. There are 5,818 m. of

Alberta, one of the prairie provinces of the Dominion of Canada. It was constituted in 1905

riety, operated by the C.P.R., and seven municipal airports, Edmonton ranking as one of the chief commercial airports in the Empire. A flourishing tourist industry is forecast by the development of huge holiday resorts in the Rockies, as at Banff, and of the parks. The unspoiled country includes several Indian reservations.

The population of the seven cities in 1941 was as follows: Edmonton, the capital, 93,817; Calgary, 88,904; Lethbridge, 14,612; Medicine Hat, 10,571; Red Deer, 2,924; Drumheller, 2,748; Wetaskiwin, 2,318. The 60 municipal districts are organized to cover as nearly as possible the area of nine townships apiece, i.e. roughly 18 m. square, and are governed by elected councils. The provincial executive is vested in a lieutenant-governor appointed by the federal government and in a cabinet selected from the legislature. An assembly of 57 is chosen by the direct vote of both sexes. Alberta sends 6 senators and 17 members of the house of commons to the Canadian parliament at Ottawa.

at Edmonton; this is coeducational, and has extension courses and a summer school. *See Social Credit. Consult History of Alberta, J. Blue, 1924; The Alberta Experiment, C. H. Douglas, 1937.*

Albert Canal. Belgian inland waterway, constructed 1930-39, at a cost of £8,300,000. Nearly 79 m. long, it runs from Liège to Antwerp, supplanting to a great extent an older canal taking a circuitous route and unsuitable for modern requirements. The Albert canal has six locks with double chambers of 150 yards by 17 yards, one chamber at each lock being divided into two compartments by intermediate gates. Vessels of up to 2,000 tons can now reach Liège in two days from Antwerp, whereas previously the journey took more than a week. The canal forms a direct link between the Limburg-Liège industrial basin and the port of Antwerp, and merchandise shipped at points on the Meuse reaches the Scheldt without leaving Belgian territory. At many points the canal is above sea level, and protective dykes and embankments have been built.

Since 1936 the Social Credit government has achieved an average yearly reduction of almost \$2,500,000 in the provincial debt. Cooperation is encouraged by laws relating to finance, marketing, and housing; while genuine private enterprise is welcomed, monopoly in any field is precluded. Alberta claims that its labour legislation is the most progressive in the Dominion, and its acts regulating wages and hours have been widely studied. There is a supreme court with judges appointed for life from Ottawa. Schools are supported by government grants and local taxes, and pupils numbered 151,985 in 1944. The university of Alberta (1908) is

Apart from its economic importance, the canal was also designed to be an integral part of Belgian frontier defence, particularly in closing the Maastricht gap with what should have been a formidable obstacle to tanks. But in the event two vital bridges were seized intact by the German parachutists on the first day of the German invasion, May 10, 1940, and an immediate withdrawal to the Antwerp-Namur line was inevitable.

Albert Embankment. London thoroughfare. On the E. or right side of the Thames, which here flows N., it runs from Vauxhall to Westminster Bridge, being a mile long. The Houses of Parliament look across the river to its N. end. The embankment was completed in 1869 and named after the Prince Consort.

Albert Hall, ROYAL. Building in South Kensington. It was completed in 1871, and, with the Albert Memorial in Kensington Gardens, was dedicated to the memory of Albert, Prince Consort. It was designed by Captain Fowke, R.E., but after his death was almost entirely re-designed by Sir Gilbert Scott, though Captain Fowke's original scheme of corridors and stairways was preserved. It is nearly a true ellipse in plan with an exterior in the Italian Renaissance style, the façade being of red brick and terra-cotta. The front porch, facing the Albert Memorial, and the side porches are composed of huge arches spanning the carriage drive and supporting a storey above. The auditorium was designed to contain 8,000 persons, not including performers, for whom provision is made in the orchestra, which will accommodate 1,000 singers and 200 instrumentalists. Internally

Albert Canal. The stretch near Maastricht, on the Netherland-Belgian frontier

the hall measures 219 ft. by 185 ft., while the distance from the floor to the central roof is 136 ft. The centre floor-space, or arena, is reached by six staircases, and is 102 ft. long by 68 ft. The hall is chiefly used for concerts, displays, and public meetings, and its organ is one of the largest in the world. The acoustics were

Albert Hall, London, completed in 1871, from the designs of Captain Fowke, R.E., and Sir Gilbert Scott

long marred by a persistent echo. But considerable improvements were made in this respect when the Promenade concerts (*q.v.*) were transferred there in 1941, after the destruction of Queen's Hall by enemy action had left the Albert Hall the only large concert hall in London. The Albert Hall itself suffered minor damage from bomb blast in Feb., 1944.

Alberti, CHERUBINO OR BORGHEGGIANO (1553-1615). Italian painter and engraver. Born at Borgo San Sepolcro, in Tuscany, his fame rests upon his line engravings, nearly 180 in number. Several fine friezes by Caravaggio are known only through Alberti's prints.

Alberti, LEON BATTISTA DEGLI (1404-72). Italian scholar and artist. Born at Venice, Feb. 18, 1404, he was the illegitimate son of a Florentine. In 1432 he entered the service of Pope Eugenius IV, and remained in that of five of his successors, at Florence or at Rome, until his death in April, 1472. A leading figure in the artistic and intellectual circle of his time, he was famed also as a musician and architect. His writings include *De Re Aedificatoria*, 1485, the first large printed book on architecture, and a treatise on painting.

Albert Medal. British decoration instituted by Queen Victoria in 1866 for distinguished acts of bravery in life-saving at sea, and extended in 1877 to mark similar acts on land. The rules of the award were amended in 1905. Each of the two classes is in two divisions. The badge is oval, in gold for the 1st class and bronze for the 2nd, with

Albert Medal
Courtesy of
Geo. Philip & Sons

the monogram V.A.; that for sea service has an anchor interlaced with the monogram. The ribbon is crimson and white.

Albert Memorial. Elaborate canopied monument, erected in Kensington Gardens, London, in memory of Albert, Prince Consort. Finished in 1872 and unveiled March 9, 1876, it is 150 ft. high, the gilded statue of the prince being by J. H. Foley. The whole, which is richly embellished with statuettes in high relief representing painters, sculptors, and musicians, was designed by Sir Gilbert Scott.

Albertus Magnus (c. 1205-80). Scientist, philosopher, and theologian. Called the Great, he was born of a noble family at Lauingen, Swabia. He studied at Padua, joined the Dominican order of friars in 1223, taught theology at Hildesheim, Ratisbon, Cologne, and Paris, where Thomas Aquinas was one of his pupils, and in 1254 was elected provincial of the Dominicans in Germany. In 1260 he was made bishop of Ratisbon, but resigned two years later and returned to his studies at Cologne. He took part in the Council of Lyons, 1274. Beatified, but not fully canonised as a saint, by Pope Gregory XV in 1622, his festival is kept on Nov. 15.

Albertus Magnus was, with the possible exception of Roger Bacon, the greatest scientist, philosopher, and theologian of his time. Hence the title universal doctor bestowed upon him. In the development of physical science, notably physical geography, botany, astronomy, and mineralogy; in calling attention to the importance of Aristotle's teaching; and in shaping the form of Christian philosophy and theology he exercised a lasting influence. His works, 21 folio vols., were published in 1651 at Lyons and in Paris, 1899-1900. *See* Scholasticism.

Albertville. Settlement in the Belgian Congo, on the W. shore of Lake Tanganyika. It is the terminus of a rly. from the river Lualaba to Lake Tanganyika, thus giving communication by rly. and water from the mouth of the Congo, on the W. African coast, to Dar-es-Salaam, on the E. littoral.

Albery, JAMES (1833-1889). British playwright. Born in London, May 4, 1838, he wrote and adapted many plays for the London stage between 1866 and 1880. The comedy *Two Roses*, in which Irving appeared (1870), was his most conspicuous success. In 1878 he married Mary Moore (*q.v.*), who was at that time leading lady at the Criterion theatre, where Albery was retained as a stock writer. He died Aug. 15, 1889. A son, Bronson James Albery (b. 1881), became a well-known London theatrical manager, knighted 1949.

Albi. City of France. The capital of Tarn department, it is on the Tarn, 44 m. by rly. N.E. of

Albert Memorial, Kensington Gardens, London, designed by Sir Gilbert Scott

Toulouse. The seat of an archbishop, it has a cathedral dating from the 13th century and a 14th century archiepiscopal palace. It manufactures textiles and trades in wine, grain, and fruit. The city suffered much in the wars against the Albigenes, who took their name from it. Pop. 29,351.

Albian. The name of deposits that lie immediately beneath the Cenomanian or lower chalk. They are represented in Britain by lower greensand and gault.

Albigenses. Name given to a religious sect which flourished in the S. of France in the 11th-13th centuries. Derived from the town

of Albi, one of their centres, it was first used about 1180 or some 150 years after their first appearance. Their beliefs were akin to those of the Cathars, the Bogomils, the Paulicians, and other sects of the E of Europe, whence they were introduced into France. These beliefs, in brief, were that man and matter were wholly evil, that Jesus Christ never existed save in the spirit, that marriage was to be deprecated, and that only by abstinence and self denial could men free themselves from the evils inherent in their bodies. Their leaders were the Cathari (pure) or Perfecti, called also the Bons hommes, who practised a rigorous asceticism which their followers were not called upon to emulate. On the political side the Albigenses were deliberately opposed to the whole system of the Church of Rome and to the faith and morals of Christendom.

The doctrines of the Albigenses spread rapidly, especially in Aquitaine, where the powerful ruler, Duke William IX, befriended them. Several councils of the Church condemned their practices and doctrines, and as early as 1022 certain of them were put to death. But the people favoured them, and many of the feudal nobles, anxious to be free of the authority of the Church, were on their side. Preachers, including St Bernard of Clairvaux, and papal legates were sent to convert them, but failed to arrest the growth of the heresy. With Pope Innocent III began the last and most tragic chapter of their history. Peaceful argument having failed a crusade was preached by the Cistercians, and under Simon de Montfort a war, or rather massacre, began. It raged from 1209-29, and in addition to being a merciless religious war was an effort to crush the independent tendencies of the nobles of S France. In both aims it succeeded. The Albigenses were scattered and reduced, the land was made a desert, and the counts were shorn of power. In several towns the Inquisition was set up, and its officers spared neither time nor effort in hunting down their victims. In 1245 the stronghold, Mont Segur, was captured, and a century later the Albigenses no longer existed. See Facts and Doctrines illustrative of the Albigenses and Waldenses, S R Matland, 1832, Innocent III la Croisade des Albigeois, A Luchaire, 1905.

Albinism (Lat *albus*, white) Absence of the natural pigment of the skin, hair, and coating of the eye. The phenomenon occurs

in the human species, more noticeably among negroes and is found in many usually coloured animals. The hair of a true albino is white, the skin transparent, and the eyes generally appear pink, the iris being colourless and transparent, thus allowing the red blood vessels to be vaguely seen through it and rendering the eye abnormally sensitive to light. A kind of albinism is seen in the periodic assumption of white by animals in the northern regions in winter. The Arctic fox and hare and the

Albinism. A lack of natural pigment is particularly noticeable in negro races as in this Basuto boy.

ptarmigan are examples. The albinism of white mice tends to become hereditary and is fostered by selection in breeding.

Albion Ancient name of the British Isles. It is possibly of Celtic origin, and was connected by the Romans with *albus*, white, from the colour of the Dover cliffs.

Albite (Lat *albus* white) Plagioclase feldspar, sodium aluminum silicate. It occurs both as a primary and secondary constituent of igneous rocks and is prevalent in the crystalline schists.

Albo-carbon Name applied to naphthalene, $C_{10}H_8$ from its use in the albo carbon system of enriching illuminating gas. The substance is often known as carbon, and under this designation it is employed for preserving furs and woollen goods from moth.

Alboin (d 572 or 573) Lombard conqueror of Italy. He became king of the Lombards in Pannonia about 565, and after helping to subdue the Ostrogoths joined forces with the Avars against the Gepidae, who were totally defeated. Alboin slew the Gepid king Cunimund and married his daughter Rosamund. In 568 he invaded Italy and subdued most of the northern part of the country, making Pavia, after a three years' siege, his capital. He was assassinated in 572 or 573 at the instance of Rosamund, whom he had forced at a banquet to drink

out of a wine cup made from her father's skull. A great ruler and the founder of the Lombard dominions in Italy the name and fame of Alboin were long celebrated in song and story.

Albona (Croat Labin) Town of Yugoslavia. It is on the E side of the Istrian peninsula 41 m S E of Trieste, in the neighbourhood of lignite mines. Once Austrian, and then from 1919 Italian. Albona became predominantly Italian in pop. It is in the area ceded to Yugoslavia by Italy in 1947. See Istria.

Albornoz, GIL ALVAREZ CARILLO (1300-67) A Spanish soldier and prelate. He was born at Cuenca, Spain, and became archbishop of Toledo. He took part in the fighting against the Moors, and for saving the life of Alfonso XI of Castile was made a knight. Created cardinal by Clement VI at Avignon, and sent as legate to Rome by Innocent VII, he died at Viterbo after being appointed papal legate at Bologna.

Albret Notable French family which had extensive lands in the S of France. In 1415 Charles d'Albret, constable of France, was killed at the battle of Agincourt, and a century later Alain d'Albret revolted against Charles VIII. Alain's son, John, married Catherine of Foix and became king of Navarre, and their son Henry was made a duke of France in 1550. Henry married Margaret, a sister of King Francis I, and their daughter Jeanne (1528-72) was historically the most important member of this family. On her father's death she became queen of Navarre, and by her marriage with Antony of Bourbon mother of Henry IV, to whom her kingdom passed. Jeanne, a zealous Calvinist, was a leader of the Huguenots during the civil wars of religion in France.

Albrizzi, ISABELLA TFOCCHI, COUNTESS D' (c 1761-1836) Italian writer. Born at Corfu of an ancient Greek family, she married in 1776 as her first husband, Carlo Antonio, a Venetian nobleman. From him she was divorced in July, 1795 and on March 25, 1796, she married Count Giuseppe Albrizzi, the official inquisitor Morelli, Alfieri, Ugo Foscolo, and Byron frequented her salon in Venice. Her second husband died in 1812, but she survived until Sept 27, 1836. Her best known works are *Ritratti di Uomini Illustri* a series of line portraits of distinguished men with descriptive letterpress, and *Opere di Scultura e di Plastica* di Canova, Florence, 1809. Her early

appreciation of Canova's work helped very considerably to win recognition for his genius

Albrun Pass Alpine route between Switzerland and Italy. It leads up the Binn valley in the canton of Valais, down the D'Avro glen to Baceno N of Domo d'Ossola. It rises to 7,907 ft

Albuera, BATTLE or British victory in the Peninsular War. It was fought on May 16, 1811. The French, about 23,000 strong, under Marshal Soult, were marching to relieve Badajoz, then besieged by the British. Wellington ordered Beresford to raise the siege and intercept the advancing enemy, the village of Albuera, 13 m SE of Badajoz, being selected as the place of meeting. On the 14th the allied troops began to assemble on a ridge overlooking the village, and by the morning of the 16th over 30,000 were in position, only about 6,000 being British, the rest Spaniards and Portuguese.

Early on the 16th Soult sent a column to cross the little stream Albuera and assail the allied left. This however was a feint. The main French attack was directed against the right flank of the Allies. Beresford was expecting a frontal assault and before he could wheel his men to the right the enemy was upon them and the fight for the hill began. The British 2nd division was brought from the other side of the battlefield to the aid of the Spaniards who had met the first shock of the French, but its first brigade was almost destroyed by fire, coupled with a charge of the enemy's cavalry upon its rear. Another brigade followed up, however, and it was during this stage of the struggle that the 57th (Middlesex) regiment earned their name of the Die Hards, for their colonel, when badly wounded, called to them to 'die hard'. Out of 575 combatants they lost 423, and the Buffs suffered almost as heavily,

the musket fire of the French soldiers only a few yards away, causing most of the casualties.

The confusion was terrible. Neither side had room to deploy. Beresford narrowly escaped death or capture and, becoming unnerved, rode away and prepared for a retreat. The day was saved by Colonel Hardinge, afterwards Lord Hardinge, who ordered up the last reserves, British and Portuguese. The latter were told off to watch the French horsemen, while three battalions of Fusiliers, two of the 7th (Royal) and one of the 23rd (Royal Welsh) advanced up the hill. In describing their deeds as they went steadily forward, indifferent alike to the death in front and the disorder around, Napier writes in one of his most memorable passages: 'Then was seen with what a strength and majesty the British soldier fights,' and when it was all over only 1,500 un wounded men, the remnant of 6,000 unconquerable

Centre: Marshal Beresford is being attacked by a fallen Polish lancer, while others advance from the left. In the centre background British troops are driving the enemy up the hill, and a little farther to the right the attack on Albuera bridge is depicted. In front of the bridge are the 57th Foot (Middlesex Regt.) who gained their greatest battle honour here, May 16, 1811.

ALBUERA EPISODES IN THE COURSE OF THIS CRITICAL BATTLE OF THE PENINSULAR WAR

From a print published in July 1811 in the Crookshank Military Prints Collection, British Museum.

British soldiers, stood triumphant on the fatal hill." The French got away in fairly good order across the Albuera, taking with them 500 prisoners. The combat lasted for seven hours, during which time over 8,000 French and some 7,000 Allies fell. See *Peninsular War*. W. F. P. Napier, Vol. III, 1836.

Albufera. Lake in Spain, 7 m. S. of Valencia. It is 12 m. long and 4 m. broad, communicates with the Mediterranean by sluices, and is connected by canal with Valencia. It is rich in fish and water-fowl.

Albula. Pass in Switzerland from Bergün, in the valley of the Albula, to Ponte on the Inn (upper Engadine). It is in the canton of Grisons, and its highest point is 7,595 ft. A good carriage road was made across it in 1865, and a rly. tunnel was pierced below it in 1898-1903. The Albula river rises in the pass and flows into the Hinterrhine below the Via Mala.

Album. General name for books of blank leaves on which can be written, drawn, or pasted autographs, verses, or sketches. There are also special kinds for keeping photographs, picture postcards, postage stamps, or press-cuttings. In ancient Rome albums were whitened boards on which were inscribed public notices and lists of officials. In the first half of the 19th century many illustrated miscellanies were published under the general title of albums, e.g. *The Keepsake*, *Forget-me-not*, *Friendship's Offering*.

Albumin and ALBUMEN (Lat. *albus*, white). Important subgroup in the class of nitrogenous constituents of both plants and animals known as proteins. To-day albumins are classed as simple proteins. The term albumen is now generally restricted to white of egg and the chemical expression albumin to its chief constituent.

Albumin is a complex carbon compound, which occurs only in living bodies and is essential to both plant and animal life. So far all attempts to prepare albumin synthetically have failed. The various kinds are as follows:

Of Animal Origin: Ovalbumin or egg-albumin; serum albumin or blood albumin; lactalbumin from milk; myosinogen from striated muscular tissue.

Of Vegetable Origin: Abrin from abrus seeds; legumelin from lentils, horse-beans, and peas; leucosin from wheat; ricin from castor bean.

The distinguishing chemical characteristics of the albumins are that they are soluble in water and are not precipitated from their solutions by magnesium sulphate,

but are precipitated by ammonium sulphate. As is well known in the case of white of egg, albumin under the influence of heat changes into a white insoluble substance known as coagulated albumin. It is to ensure this taking place throughout an egg that the egg is boiled for eating purposes for about four minutes. The white of egg contains about 12 p.c. of albumin and has in its composition 85 p.c. to 88 p.c. of water. White of egg contains lactoflavin (vitamin B2) but no other vitamin is present in significant amount.

For technological purposes albumin is prepared from white of egg by evaporating the liquid to dryness at temperatures below that at which it coagulates. Dried white of egg occurs in the form of translucent pale yellowish scales soluble in eight parts of water. Albumin forms nearly 8 p.c. of the serum of the blood. For technological purposes the blood of animals obtained from slaughterhouses is allowed to clot in shallow zinc pans and the serum is drained away and evaporated. Five oxen yield about 4½ gallons of serum and about 4½ lb. of albumin.

The two albumins described above have similar properties. They are used on a large scale in calico printing for fixing colours in the fabric. The albumin is printed on the calico and coagulated by exposing it to steam. The fabric is then dyed, the colour only attaching itself to those parts where albumin has been printed. Albumin was formerly largely used in sugar refining and in photography.

Lactalbumin is only present in small amounts in cows' milk, and is coagulated by boiling. It forms the "skin" which is noticeable in boiled milk. Casein, the most important protein in milk, is known as a derived albumin. Other derived albumins or albuminates are known as acid albumin and alkali albumin, and are the products of the action of acids and alkalis on albumin. Myosinogen, the albumin of the muscles, is the substance the coagulation of which in a dead body causes the rigid condition known as *rigor mortis*. The vegetable albumins are generally prepared by precipitating aqueous solutions by saturating the liquid with ammonium sulphate, and are of importance in considering the food values of plants.

S. W. WOOLLEY

Albuminoids. Class of substances, as the name signifies, resembling albumin. The modern

name for albuminoids is scleroproteins. They are derived from animal tissues and are chiefly represented by gelatin and horn. These have been conveniently classified as follows: collagens, fibroids, chitinoids, and keratin.

The principal collagens or jelly-forming albuminoids are collagen, chondrigen, and sericin. Collagen is prepared from connective tissues or tendons and bones, that from bones being known as ossein. Both these substances yield gelatin or glue by the action of boiling water. Chondrigen is a body analogous to collagen and is contained in the hyaline cartilage. Sericin or silk-glue is dissolved from silk by hot water. The chief fibroids are elastin, the elastic fibre of connective tissue, and fibroin, contained in silk and spiders' web. The chitinoids are chitin, prepared from crab-shells or the wing-cases of the cockchafer, conchiolin, obtained from the shells of mussels or snails, and spongin, the characteristic substance of sponge. Keratin is contained in hoofs, horns, and similar substances. There are other scleroproteins of minor importance with distinct chemical characteristics.

Albuminuria (Lat. *albumen*; *urina*, urine). Presence of albumin in the urine, most often a sign of disease of the kidneys, bladder, or urethra, but also occurring in fevers and other affections. To test for albumin in the urine, add a few drops of acetic acid to the urine if it is alkaline until it becomes acid, and boil the top of a column of the fluid in a test-tube held obliquely in the flame of a spirit-lamp, finally adding a drop or two more of acetic or nitric acid. A cloudy formation at the top of the urine indicates the presence of albumin. Another test is to pour nitric acid gently on the surface of urine in a test-tube, when, if albumin is present, a white ring will form at the junction of the two fluids. These tests are only reliable when performed by experts.

Albuquerque. Chief city of Bernalillo county, New Mexico, U.S.A. On the Rio Grande, 36 m. S.W. of Santa Fé by the Atchison, Topeka and Santa Fé Rly., it is a rly. centre and the seat of the university of New Mexico. The city contains a large wool-scouring plant and deals with the products of the many ranches of the neighbourhood. It trades in hides, wool, lumber, and fruit, and there are a few small gold, copper, and lead mines in the vicinity. Pop. 35,449. *Pron.* Albú'-kerk.

Albuquerque, AFFONSO D' (1453-1515). Portuguese viceroy of the Indies. He was born of noble parents at Alhandra, near Lisbon. and educated in the royal palace. In 1503 he made his first expedition to the Indies, and established the influence of Portugal in Cochín. Three years later, under Tristan da Cunha, he went again to the East, and made his way to the island of Ormuz in the Persian Gulf. This he seized, but kept only for a short time. In 1507, succeeding Francisco d'Almeida as viceroy of the Indies, he began at once a series of conquests. Goa and Malacca and eventually Ormuz were secured, but an attempt on Aden failed. In 1515 his enemies at the Portuguese court secured his downfall, the king sending out his foe, Soarez, to take his place. Albuquerque died at sea near Goa, Dec. 16, 1515. He was buried at Goa, which has remained in the possession of Portugal to this day. His Commentaries, translated into English, were published by the Hakluyt Society, 1875-84.

Albuquerque,
Portuguese Viceroy

Albury. Town of New South Wales, in Goulburn county. At the head of steam navigation on the river Murray, it is 336 m. by rly: S.W. of Sydney, and is the centre of an extensive agricultural district noted for its sheep (producing what is claimed to be the world's finest merino wool), cereals, and wine. The Hume reservoir, opened Nov. 22, 1936, eighth largest in the world, has greatly contributed to the prosperity of the district. Pop. 12,940.

Albury is also the name of a village of Surrey, England, 4 m. E. of Guildford.

Alcaeus (c. 600 B.C.). Greek lyric poet. A native of Mitylene in Lesbos, and of noble family, he fought on several occasions in defence of the oligarchy to which he belonged, and as a result was banished and went into exile in Egypt. Returning, he took up arms against the tyrant Pittacus, was taken captive, but magnanimously forgiven. The surviving fragments of his political poems are passionate, but manly; his love and drinking songs are characterised by sensuality. He wrote in the Aeolic dialect.

Alcaic Metre. Form of classical lyric poetry said to have been

used first by Alcaeus of Mitylene. It is a favourite with the Roman poet Horace, and is familiar to English readers from Tennyson's imitation in his lines to Milton: O mighty-mouthed inventor of harmonies, O skilled to sing of time or eternity, God-gifted organ-voice of England, Milton, a name to resound for ages.

Alcalá de Henares. Town of Spain, in Madrid province. On the Henares, it is 21 m. by rly. N.E. of Madrid. The Roman Complutum and the Moorish Al-Kalah, it was the birthplace of Cervantes and Catherine of Aragon. At its university, founded by Cardinal Ximenez de Cisneros in 1510, was produced, 1514-17, the great Polyglot Bible or Biblia Complutensis, in Hebrew, Latin, Greek, and Chaldean. Its buildings include the old university, the former palace of the archbishops

Alaska (the name is an abbreviation of Alaska-Canada) it links a road that already ran from the U.S. to Dawson Creek in British Columbia via Calgary and Edmonton, with Fairbanks in Alaska. The route is through Fort St. John and Fort Nelson in British Columbia and Whitehorse in the Yukon. At Fairbanks it joins a network of roads to the Pacific. The length of the road is 1,671 miles; it is 24 ft. wide and its construction involved the bridging of 200 streams. The highway's defence was a joint Canadian-U.S. responsibility. Over 10,000 U.S. army engineers, assisted by 4,000 civilian workers, Canadian and American, were employed in its construction. It was agreed that the U.S. would be responsible for its maintenance for six months after the end of the Second Great War. In

Alcan Highway. Military road, built in 1942, running from Edmonton, Alberta, through British Columbia to Fairbanks in Alaska. It is 1,671 miles in length

of Toledo, the cathedral, and the church of S. Maria, where Cervantes was baptized. Pop. 11,725.

Alcalde (Arabic, *al-qadi*, the judge). Spanish official title for the president of the council of the commune. Usually he is chosen by the members of the council in the larger towns, but he may be appointed by the government. He discharges certain executive and judicial duties, his position being not unlike that of an English mayor. The title is largely used in Spanish America.

Alcan Highway. Begun in mid-March, 1942, and officially opened for wheeled traffic, Nov. 20, 1942, this highway was designed to facilitate the transport of war materials to Alaska, as the spearhead of an Allied attack upon Japan. Connecting the U.S. with

1946 the Canadian government incorporated its section of 1,257 m. into its road system as the North Western Highway.

Alcaniz. Town of Spain, in Teruel province. On the Guadalupe, 65 m. S.E. of Zaragoza (Saragossa), it was the scene of a famous battle, 212 B.C., in which the Carthaginians under Hasdrubal Barca defeated the Romans under Gnaeus and Publius Cornelius Scipio. The town has a medieval castle and the old walls.

Alcántara (Arab. *al-kántarah*, the bridge). Town of Spain, in Cáceres province. On the left bank

Alcántara. Roman bridge over the Tagus built A.D. 105 and still in use. The central arches have each a span of 100 ft.

Alcázar. Main entrance to the 14th century Moorish palace, twice restored, at Seville

of the Tagus, 35 m. N.W. of Cáceres, it is famous for its six-arched Roman bridge, 617 ft. long, 26 ft. wide, with middle piers about 190 ft. high. Built A.D. 105, this bridge was thoroughly restored in 1860. The Gothic church of S. Maria de Almocóbar dates from the 13th century. In 1217 the town gave its name to the order of Alcántara, a Spanish order of knighthood, later reconstituted as a military order.

Alcántara. Seaport of Brazil, in Maranhão state, 16 m. N.W. of Maranhão city.

Alcaraz. Town of Spain, in Albacete province. It is 36 m. W.S.W. of Albacete, with copper, tin, and zinc mines in the vicinity. It manufactures leather, wool, and linen, and is in a good cattle-producing district. Pop. 5,400. The Alcaraz mts., the E. extension of the Sierra Morena, are in Albacete province.

Alcatraz. Island in San Francisco bay. It is 1,650 ft. long and rises to 130 ft. It has a light-house and a long-term U.S. federal prison. On May 2, 1946, the convicts mutinied and, obtaining fire-arms from the armoury, waged a 36-hour battle with 132 marines and warders armed with machine-guns and hand-grenades. Three convicts and two warders were killed before the mutiny was quelled.

Alcázar (Arabic, *al qasr*, the palace). Name applied to various Moorish palaces in Spain. They were built as strongholds, but, in

accordance with the Moorish love of decorative art, their ornamental work and their arcaded courts are a distinguishing feature. Notable examples are the alcázar of Seville, built in the 14th century on the site of a Moorish citadel of 1181, and restored in 1624 and 1857; that of Toledo, captured by Spanish government troops on Sept. 20, 1936, after a fierce resistance of nine weeks by a nationalist garrison; and that of Segovia, built by Alfonso VI of Castile (1072-1109), renewed 1352-58, but almost destroyed by fire in 1862.

Alcázar de San Juan. Town of Ciudad Real province. It is 92 m. by rly. S.E. of Madrid, a junction for the Andalusian rlys., and a centre of the Estremadura, Andalusia, and Alicante wine trade, and manufactures gunpowder, soap, and damascened daggers. Alcázar has associations with Cervantes and Don Quixote. Pop. 16,000.

Alcester. Parish and market town of Warwickshire, England. It lies at the union of the rivers Alne and Arrow, 15 m. S.W. of Warwick by railway. Market day, Wed. Pop. 2,195.

Alcestis. In Greek legend, the wife of Admetus. The Fates, at the request of Apollo, had granted her husband immortality on condition that he procured another

to die in his stead. His aged parents, although they had only a few more years to live, refused, but Alcestis nobly sacrificed herself. In one version Alcestis is said to have been brought back to her husband from the underworld by Hercules. The story is the subject of the drama of the same name by Euripides and of Brown-ing's *Balaustion's Adventure*.

Alchemical Signs. Marks or symbols used by early chemists. The ancient chemists worked in an atmosphere of mystery partly due

Gold		Alum		Oil	
Silver		Nitre		Air	
Copper		Vitriol		Earth	
Iron		Verdigris		Fire	
Quick-silver		Sal Am-moniac		Water	
Lead		Vinegar		Hour	
Antimony		Aqua Fortis		Day	
Sulphur		Quick-lime		Retort	

Alchemical signs or symbols

to the suspicion with which their work was regarded. Probably on this account they invented a kind of shorthand to express the operations in which they were engaged. Down to the end of the 17th century books on chemistry employed these signs in the directions for preparing chemicals and drugs. Some of the symbols are given above. The first column gives the symbols for substances now recognized as elements, gold, silver, copper, and iron being also called Sol, Luna, Venus, and Mars from their dedication to those planets.

ALCHEMY: BIRTH STAGE OF CHEMISTRY

S. G. Blaxland Stubbs, joint author *Sixty Centuries of Physick*

Showing how, from an art dealing with the working and colouring of metals, alchemy concerned itself with the search for medicines and gave rise to the science of chemistry. See Chemistry

Alchemy is a term used for the art of chemistry as practised from ancient times to the middle of the 17th century. It must be distinguished from the science of chemistry, which may be said to have been founded by Robert Boyle (1627-91). The word is derived from the Arabic *al*, the definite article, and *kimiya*, a word of Greek origin, probably not meaning the art itself but the material employed. *Kimiya* may be a form of *chymeia*, infusion, from *chymos*, the sap of trees, which was of

special importance in medieval chemistry as applied to medicine. Its application to the transmutation of metals was probably a later development. Some authorities connect *kimiya* with Egyptian *khem* (black), the name of Egypt as the land of black earth, associated with the idea of the black art.

Roger Bacon, in the *Mirror of Alchemy*, defines alchemy as follows: "Alchemy is a science teaching how to transform any kind of metall into another, and that by proper medicine as it

appears by many philosophers' bookes. Alchemy, therefore, is a science teaching how to make and compound certain medicine which is called elixir, the which when it is cast upon mettalls or imperfect bodies doth fully perfect them in the verie projection." There was, in addition, a philosophical side of alchemy expressed in mystical language.

There seems no doubt that the earliest chemistry had to do with the working and colouring of metals, and that the search for medicines for the body and the applications of alchemy to technical processes were developments of metal working. The Chaldaeans seem to have associated gold, silver, mercury, iron, tin, copper, and lead with the planets (Sun, Moon, Mercury, Mars, Jupiter, Venus, Saturn), and to have held the doctrine that metals were all made of sulphur and mercury in various proportions. The "perfect" metals were gold and silver, but the others could be perfected by "projecting" certain substances, or "medicines," upon them when in a heated state.

The Philosopher's Stone

The "medicine" was called "the philosopher's stone," two varieties of which were postulated: a white one for transmuting metals into silver, and a red one for transmuting them into gold. The philosopher's stone, dissolved in alcohol, and known as *aurum potabile* (drinkable gold), or the elixir of life, when used on the human body, was believed to produce eternal youth. Alchemists also sought for the alcahest or universal solvent, a method of creating living beings and of restoring plants from their ashes.

There was some ground for the belief that transmutation of metals was possible. When a strip of bright iron is immersed in sulphate of copper solution, the iron appears to be converted into copper, owing to the electrolytic deposition of a film of copper on the iron. It would not have been impossible to obtain silver from a lead ore, and as the alchemical processes were essentially methods of purification, a small proportion of silver might have been obtained by them. Similarly pyrites containing gold may have been used to obtain a small amount of that metal. The recipes in the works of alchemists, at least those that are intelligible, produce alloys, which elementary chemical knowledge could not distinguish from the precious metals. The idea of the "multiplication" of gold by alchemical methods is explained

on the same principle. The furnaces and alembics employed by the alchemists were practically on the same model as those in use to-day.

There are no written records of Chaldaean alchemy extant. Hermes Trismegistus, an Egyptian who lived about the time of Moses, is the earliest alchemist of whom we have any knowledge. When we refer to a hermetically closed vessel, we unconsciously recall the directions which Hermes gave for tightly closing the philosopher's "egg," in which transmutations took place. He held the

Egypt in 640, seem to have absorbed the philosophy of the Greeks through the Syrians of Mesopotamia and to have combined with it the practical knowledge of the temple laboratories of Egypt. To Geber, one of the chief Arabian students of alchemy, is attributed the doctrine that all metals are composed of mercury and sulphur. He appears to have been acquainted with saltpetre, sal ammoniac, green vitriol, and aqua fortis, and with processes of sublimation, distillation, filtration, and crystallisation. He devised the

Alchemy. Sketch from a painting by Pieter Brueghel (1564-1637). At foot of the original is a Dutch rhyming inscription to the effect that the alchemist wastes time and treasure, and in the end starves in a workhouse

view that "as all things were produced by the one Being, so all things were produced from this one thing by adaptation," and, apparently, that nothing in the world dies, only changes, an anticipation of what is known as the conservation of energy. Other Egyptian writings dealing with alchemy are the Ebers papyrus, the Chrysopoeia of Cleopatra, which gives methods of distillation, and that of Mary the Jewess.

The Greek philosophers and physicians who flourished between 400 B.C. and A.D. 100 include Aristotle, who added to the four elements of Empedocles—earth, water, air, and fire—a fifth, which he termed ether or quintessence; and Pliny the Elder (d. A.D. 79) devoted five volumes of his *Historia Naturalis* to chemical knowledge. Zosimus of Panopolis (probably 3rd century) is said to have originated the maxim: like begets like. Africanus the Syrian, Synesius of Cyrene, Olympiodorus of Thebes (5th century), and Galen may also be referred to.

The Arabians, who conquered

method of making milk of sulphur. Avicenna (Ibn Sena), known for his controversy with Rhases as to the truth of alchemy, is credited with the observation: he who knows no chemistry does not deserve the name of a philosopher. The Arabs or Moors, passing through Northern Africa, crossed to Spain, and thus the knowledge of alchemy spread over Western Europe.

The best known Western alchemists of the 13th and 14th centuries are Albertus Magnus, Vincent of Beauvais, Roger Bacon, Thomas Aquinas, Raymond Lully, and Arnold de Villanova. Roger Bacon discovered the telescope, and the gunpowder recipe given in his *De Secretis* was first used in warfare by the English in 1327. Thomas Aquinas first used the term amalgam to designate an alloy with mercury. Raymond Lully is said to have been employed by Edward I at Westminster to multiply gold for minting. Nicolas Flamellus (d. 1418), the French alchemist, is alleged to have discovered how to transmute base metals into gold

from a book by Abraham Eleazar, who professed to have obtained his knowledge from copper tablets engraved by Tubal Cain.

The chief alchemists of the 15th century were Isaac of Holland, the first of the Dutch alchemists, Basil Valentine, Bernard Trevisan, Philip Ulstadt of Nuremberg, Sir George Ripley, and Thomas Norton. Basil Valentine introduced the use of antimony into medicine and insisted that if an alchemist would transmute metals he must be a pure instrument. Bernard Trevisan squandered enormous sums in search of the philosopher's stone. Philip Ulstadt is known chiefly for his researches on alcohol. Sir George Ripley published *The Compound of Al-chemie* in 1471 and the *Medulla Alchimiae* in 1476. He describes the twelve chemical processes needed by the alchemist. Thomas Norton, a pupil of Ripley, held that alchemical knowledge could only be obtained by word of mouth from an adept. His *Ordinal of Alchemy* is in verse. One curious idea of his was that metals "grow" in the earth, and he recommended that exhausted mines be closed up to allow the metal to grow again.

The 16th century produced many alchemists. Among them was the famous Paracelsus, who is known as the first iatrochemist, because he taught that the object of chemistry is not to make gold but to heal disease. He invented laudanum and opodeldoc, and in his medical practice administered heroic doses of mineral drugs, such as corrosive sublimate, turpith mineral, alembroth salt, red precipitate, and antimony. Paracelsus announced that he had found the elixir of life, but died aged 48.

First Use of the Term Gas

Edward Kelley (1555-95) professed to have discovered at Glastonbury Abbey *The Book of S. Dunstan* and two caskets containing red and white philosopher's stone. He and his master (or dupe), Dr. Dee, wandered over Europe, Kelley pretending to exhibit the process of transmutation. Andreas Libavius (d. 1616) discovered tin tetrachloride, or *spiritus fumans Libavii*. He prepared sulphuric acid from alum and green vitriol and made artificial rubies. John Baptist van Helmont (1577-1644) spent most of his time trying to discover the alcahest, and was the first to use the term gas. Gas pingue was the name applied to impure ammonia and gas silvestre to carbonic acid gas. Oswald Croll was the discoverer of succinic acid and silver

chloride. The Rosicrucian Society, which flourished during the 16th and 17th centuries and was defended in sixteen books by Robert Fludd (1574-1637), was a secret confraternity devoted to the practices of alchemy and astrology.

The first of the 17th century alchemists, Christopher Baldwin, contrived to hit upon the method of making phosphorescent calcium nitrate, which became known as Baldwin's phosphorus. He also prepared a *spiritus mundi*, which he sold as a universal medicine. Phosphorus itself was first made in 1674 by Brand of Hamburg, who

Alchemist. Eighteenth century impression of laboratory with an alchemist watching an experiment
After Joseph Wright of Derby

sold the secret to one Krafft, who exhibited the chemical as a curiosity at the courts of Europe. Johann Kunkel, an apothecary who practised alchemy, obtained hints on the manufacture of phosphorus from either Brand or Krafft, and succeeded in making it in 1678. Great hopes were entertained that phosphorus would help to solve the problem of making the philosopher's stone.

Sir Kenelm Digby (1603-65), author of a work on *Chemical Secrets*, prepared a powder of sympathy, one for curing a wound by sprinkling it on the instrument which caused it. The powder, according to his laboratory assistant Hartman, was dried sulphate of iron. Sir Kenelm also devised a tincture of gold as a universal remedy for diseases. Adrian Mynsicht was the inventor of tartar emetic and of an elixir which, as elixir of vitriol, is still in use. Its inventor thought it would prolong life.

John Rudolph Glauber (1603-68) prepared a panacea or uni-

versal medicine from antimony. He is best known for his sal mirabile or sodium sulphate, which he lauded as of the nature of the alcahest. A useful aperient, it is still sold as Glauber's salts. Working on the same lines, Christopher Glaser succeeded in producing a salt which he named sal polychrestum Glaseri. It was potassium sulphate and its inventor deemed it useful in promoting long life. Thomas Vaughan (1622-66), who wrote under the name of Eugenius Philalethes a book describing the preparation of philosophical mercury, is sometimes confused with the writer who employed the pseudonym Eirenaeus Philoponus Philalethes, and whose real name is supposed to have been Childe. He wrote *The Marrow of Alchemy* and *The Secret of the Immortal Liquor Alcahest* or *Ignis-Aqua*, and claimed to have discovered the philosopher's stone in 1645. A pupil of his, George Starkey (d. 1665), practised medicine in the English colonies of America. He published pamphlets dealing with the efficacy of an oil made of sulphur vive and a pill of his own invention. His best known alchemical work is entitled *Liquor Alcahest*: a discourse of that immortal dissolvent of Paracelsus and Helmont.

Robert Boyle's Epoch-making Work

Nicolas Le Fevre (d. 1609), chemist and apothecary to Charles II, published in Paris, 1660, his *Traité de la Chymie*. This was translated into English by "P. D. C. Esq^{re}" in 1664, under the title *A Compendious Body of Chymistry*, rev. ed. 1670. Therein was expressed the view that the mercury of the philosophers might be discovered by systematic search. Nicholas Lemery (d. 1715) still believed in the old conception of the five elements, but his *Cours de Chymie* shows a distinct advance towards rational views in regard to chemistry. It was Robert Boyle, however, to whom modern chemistry looks as its founder. In his *Sceptical Chymist*, published in 1661, he finally overthrew the Aristotelian view of the elements and the Paracelsian theory of three principles. He first laid down the axiom that the highest aim of chemical research is the advancement of natural knowledge.

James Price (1752-83), a chemist who is sometimes known as the last of the alchemists, professed in 1782 to have discovered the philosopher's stone, and in the presence of several peers used his white and red powders to prepare

silver and gold from mercury. Some doubt being cast on the genuineness of these experiments, he was required by the Royal Society to repeat them. On the appointed day, however, he was found to have committed suicide by drinking cherry laurel water.

Bibliography. *Les Origines de l'Alchimie*, M. P. E. Berthelot, 1885; *Hermetic and Alchemical Writings of Paracelsus*, ed. A. E. Waite, 2 vols., 1894; *Alchemy, Ancient and Modern*, H. S. Redgrove, 1922; *Alchemy, child of Greek Philosophy*, A. J. Hopkins, 1935; *Modern Alchemy*, W. A. Noyes, 1933. Alchemical charlatanry is satirised in Ben Jonson's comedy *The Alchemist* and incidentally in Sir Walter Scott's novel *The Antiquary*.

Alcibiades (c. 450-404 B.C.). Athenian statesman and general. The son of Cleinias, he was born at Athens during the ascendancy of his kinsman Pericles. Endowed with rank, wealth, and personal beauty, he remains a most striking example of brilliancy ruined by recklessness and lack of principle. He was among the companions, though not the imitators, of Socrates, who saved his life at the battle of Potidaea (432 B.C.), and whose life he saved in return at the battle of Delium (424).

Shortly afterwards Alcibiades plunged into politics, his brilliant qualities and lavish expenditure connected with the state services securing him a dangerous and unstable popularity. He stirred up the Athenians to organize the expedition against Syracuse in 415, when the war between Athens and Sparta was suspended. Alcibiades procured his own appointment to the command with two other generals, but on the eve of the expedition Athens was horrified by the midnight mutilation of the sacred images called *Hermæ*. Alcibiades was charged with this and other sacrilegious offences. But his enemies waited until he had sailed in the expedition to Sicily before openly impeaching him. He was summoned from Sicily to meet the accusation. Perhaps conscious of guilt, certainly in a spirit of revenge, he betook himself to Sparta instead of returning home, and there set about intriguing for a renewal of the war against his native city.

Having succeeded, Alcibiades crossed over to Ionia, to carry out further treasonable projects against Athens. But when he discovered that some of the jealous Spartan magnates were endeavouring to bring about his own downfall, his anger turned against them. Going in 412 to

the court of the Persian satrap Tissaphernes, who was in alliance with the Spartans, he acquired great influence, which he now employed in favour of the Athenians. As a result Tissaphernes changed sides and Alcibiades was reinstated in the favour of his countrymen (411). Elected to the command of their armies without returning to Athens, he achieved a series of military and naval successes during

Alcibiades, Athenian statesman and general
Bust in the Villa Albani, Rome

the next four years, at the end of which he was received by the Athenians with enthusiasm. Two defeats, however, again deprived him of popular favour, and he retired to his estate in the Thracian Chersonese, whence, after the fall of Athens in 404, he returned to Asia Minor, probably intending to seek the favour of the Persian king Artaxerxes. But before he could carry out this plan he was assassinated. *See Greece: History.*

Alciiformes. Order of birds. More familiarly known as the auk family, it includes the puffin, razorbill, and guillemot. *See Auk.*

Alcinous. Legendary hero of Greece. In Homer's *Odyssey* he is represented as king of the Phaeacians and dwelling on the island of Scheria, identified by some with Corfu. During his wanderings Odysseus and some companions were shipwrecked on the island, where they were hospitably received before being sent on their homeward way. The halls and gardens of Alcinous were regarded as exceptionally splendid, and his subjects had a great reputation as skilled seamen.

Alciphron. Greek writer of the 2nd century A.D. He was the author of a collection of letters valuable for the light they throw on the manners and customs of the fishermen, peasants, parasites,

and courtesans of the Athens of the 4th century B.C.

Alcira. Town of Spain, in Valencia province. On the Júcar, 23 m. S. of Valencia by the rly. to Alicante, it trades in silk, rice, and oranges, and exports timber. Pop. 22,057.

Alcmaeon. In Greek legend, son of Amphiaraus and Eriphyle. Charged by his father with the duty of taking vengeance upon Eriphyle, who, bribed by the necklace of Harmonia, had persuaded her husband to join the fatal expedition against Thebes, Alcmaeon killed his mother. For this he was pursued by the Furies and, after many wanderings, reached Psophis in Arcadia, where he was purified of his crime by King Phegeus. He married first Arsinoë, daughter of Phegeus, to whom he gave the necklace of Harmonia, and, after divorcing her, Callirrhoe, daughter of a river god. Callirrhoe desiring to possess the necklace, Alcmaeon obtained it by a trick, but was slain by the brothers of Arsinoë.

Alcmaeon of Crotona. Greek physician and philosopher. A younger contemporary of Pythagoras, he lived about 500 B.C. and taught the doctrine of opposites (right and left, light and darkness). The soul was situated in the brain and, like the stars, was eternally in motion. Sensations were conveyed through pores or passages to the mind.

Alcmaeonidae. Noble family of ancient Athens, descendants of Alcmaeon, a Dorian immigrant from Pylos. A member of this family, Megacles, killed the insurgent Cylon and his supporters, after they had left the sanctuary of the altars of the gods on the Acropolis under a promise that their lives should be spared (c. 630 B.C.). Megacles was declared to have committed an abominable sacrilege, and the whole family was banished from the city. They did not return permanently to Athens until 509. They joined the popular party, and the head of the family, Cleisthenes, was responsible for the new and more democratic constitution at Athens. *See Cleisthenes.*

Alcman (c. 620 B.C.). Greek lyric poet. Born at Sardes in Lydia, he was the author of hymns, *epinikia* (songs of victory) and *parthenia* (songs intended to be sung by choruses of maidens). He wrote in the Doric dialect, with an admixture of Aeolic elements.

Alcobaça. City of Portugal, in Leiria district. Picturesquely situated between the Alcoa and Baça rivers, it is 60 m. N. of

Lisbon. Its Cistercian abbey, built 1148-1222, and one of the largest in the world, was sacked by the French in 1810, secularised in 1834, and later restored. In the early Gothic church are the tombs of Pedro I and his consort, Inez de Castro.

Alcock, Sir John (1892-1919). British airman, the first to pilot an aeroplane non-stop across the

Sir John Alcock,
British airman

Atlantic. Born in Manchester, he was trained as an engineer, being for some time at the Empress Motor Works there. He soon, however, turned his attention to aviation, and in 1912 gained the flying certificate of the Royal Aero Club. He then took part in various races, winning second place in 1913 in the race from London to Manchester and back again. In the First Great War, as a member of the R.N.A.S., he won the D.S.O., held the record for a long-distance bombing raid, and was captured by the Turks. On his return in 1919 he entered, with Lieutenant A. W. Brown, of the R.A.F., for the £10,000 prize offered by The Daily Mail for a flight across the Atlantic. On June 14, 1919, they left Newfoundland and on the next morning arrived at Clifden, Ireland. A few days later both were knighted. Alcock was killed when his aeroplane crashed at Côte d'Erard, N. of Rouen, Dec. 18, 1919, during a flight from London to Paris. See *Atlantic Flights*, and illus. p. 137.

Alcock, Sir Rutherford (1809-97). British diplomatist. Born in London, and a medical student at King's College, he saw medical service in Spain during the Carlist war, 1833-36. In 1844 he went to China as British consul, serving at Amoy and Shanghai. He was the pioneer of the model settlement of Shanghai. In 1859 he became minister plenipotentiary in Japan and from 1865 until 1871, when he retired, he was minister plenipotentiary at Peking. In 1862 he was made a K.C.B. He died in London, Nov. 2, 1897. His writings include *The Capital*

Sir R. Alcock,
British diplomatist

of the Tycoon, 1863, and *Art and Art Industries in Japan*, 1878.

Alcoforado, Marianna (1640-1723). Portuguese nun and letter-writer. Born at Beja, she was placed in a convent of that town at the age of twelve, and four years later was professed as a nun. In 1665 a young French officer, Noel Bouton, afterwards marquis de Chamilly and marshal of France, visited the convent, and remained on visiting terms for two years. Marianna's five letters describe how Noel came, saw, conquered, and rode away, and reveal her agony of grief, her pride in her passion, and finally her contempt for it. They were written between Dec., 1667, and June, 1668, and were first published anonymously in Paris in a French translation in Jan., 1669. Not until 1810 was the name of the writer discovered. The first English translation, *Five Love Letters from a Nun to a Cavalier*, was made by Sir Roger L'Estrange, 1678.

Alcohol. Used without qualification, the word means ethyl alcohol, a compound of carbon, hydrogen, and oxygen with the chemical formula C_2H_5OH . The origin of the word is obscure: it comes from the Arabic *al-koh'l*, denoting native antimony sulphide, a substance that has long been used in the East, in the form of an impalpable powder, to darken the eyelids. In the course of time the word was applied to fine powders generally; and later, probably because of the similarity of the process of sublimation, by which the finest powders were obtained, to that of distillation, it was used to describe the spirit obtained from wine. Early references to alcohol are hence somewhat indefinite, but Andreas Libavius, in his *Alchymia* (1597), makes a distinct reference to it in its present sense. Spirituous beverages have been known from time immemorial, and alcoholic fermentation, the mysterious and apparently spontaneous change which converted the insipid juice of the grape into stimulating wine, fascinated the natural philosophers from the earliest times. The Chinese seem to have been familiar with the process of distillation in the remote past, but it is usually claimed that Arabian chemists were the discoverers of alcohol from wine. In all probability, however, the credit must be given to Italian chemists of the 9th and 10th centuries. Although the words "alcohol"

and "spirits" are synonymous, it is customary in modern usage to refer to alcohol when industrial use is intended, and to spirits in connexion with potable use.

Ethyl alcohol, the ingredient of the various "alcoholic drinks" (to which their inebriating properties are mainly due), is itself a transparent colourless liquid, lighter than water, with a somewhat ethereal smell and burning taste. It is easily inflammable, burning with a blue, non-luminous flame. When the vapour is mixed with air an explosive compound is formed, and on this account it is used as a source of power in internal combustion engines. When alcohol is mixed with water a rise of temperature takes place with a diminution of volume.

MANUFACTURE. Alcohol can be made from its elements, but the usual practice is to obtain it by dehydrating the products of the distillation of fermented liquids. The fermentation of sugars and starches for the production of alcohol is carried on to an enormous extent, the principal raw materials currently used being sugar-containing substances such as molasses, and starch-containing substances such as cereals and potatoes. Generally, molasses is used for the production of alcohol for non-potable, i.e. industrial purposes, and malted or unmalted grain for whisky and other potable spirits. It can also be derived from alcohol-containing liquids such as wines. In both Great Britain and the United States large quantities of alcohol are made from molasses, which is a by-product in the manufacture of raw sugar, representing mother liquors from which sugar is no longer obtainable by crystallisation. The molasses is diluted and fermented in tanks by yeast, which converts the sugars into alcohol and carbon dioxide, the latter being sometimes collected as a valuable by-product. The fermented mash is then distilled. A continuous process for the alcoholic fermentation of molasses has been devised. In France sugar-beets are used as a source of alcohol.

The production of alcohol from grain dates back to very ancient times. The starch of grain is not directly fermentable by yeast and must, therefore, first be converted to sugar. This is done by employing either malt or certain moulds, the use of the former in the production of industrial alcohol being identical

with the methods employed in beer-making. The grain is first ground and cooked with steam under pressure; after cooling, malt is added, the diastatic enzymes of which convert practically all the starch to sugar; yeast is then added to convert the sugar to alcohol and the fermented liquid is finally distilled. In the "amyl" process of fermentation largely used on the Continent, the starches are saccharified by means of moulds, the process taking its name from *Amylomyces Rouxii*, the mould originally employed. It has recently been shown that the use of moulds in the saccharification of starchy grain mashes for the manufacture of industrial alcohol is of economic interest, the mould *Aspergillus oryzae* yielding the most satisfactory results.

Alcohol may also be made from wood by resolving the cellulose of that material into dextrose and other sugars by treatment with acids under pressure. After neutralisation of the acids, yeast is added and the resultant alcohol separated by distillation. For many years the European chemical industry, particularly the German chemical industry, has produced part of its alcohol requirements by hydrolysing wood waste to sugar, and subsequent fermentation to alcohol, and it has been estimated that 500 million gallons could be obtained in the United States from sulphite mills and sawmills. In 1945 a large commercial plant was built in the United States to produce ethyl alcohol from sawdust and waste wood. The new plant has an estimated annual production of 4,100,000 gallons of alcohol at a low cost per gallon. Other materials suitable for the production of alcohol include the Jerusalem artichoke (*Helianthus tuberosus*) and whey, as well as a wide variety of plants. Ethyl alcohol may be prepared synthetically by a number of methods, e.g., from acetylene by hydration in the presence of a mercury salt and reduction of the resultant aldehyde, or from ethylene passed into sulphuric acid and hydrolysis of the ethyl acid sulphate.

DISTILLATION. This is the process by which the alcohol is separated from water and other matters. The apparatus used, called a still, consists of two parts, the analyser and the rectifier. The action of the first depends upon the fact that the mixed vapours of alcohol and water, cooled in a suitable manner, can be separated

into two parts, one containing a large proportion of alcohol and the other being mostly water. The rectifier in successive stages renders the liquid stronger in alcohol.

Along with the alcohol are small quantities of other volatile products, of which fusel oil or amylic alcohol is the most objectionable. This can be got rid of by con-

spirit produced is of the strength of 91 p.c. and after redistillation is known as rectified spirit. Continuous still spirit has very little flavour, but by blending and distilling with various flavouring agents, potable spirits, e.g. whisky, gin, and British brandy are obtained.

As fractional distillation will produce alcohol of a maximum concentration of 95 p.c., it is important to find a commercial method whereby absolute alcohol can be obtained directly, involving but one distillation. This is carried out by adding benzene and distilling, a ternary benzene-alcohol-water compound being separated in the distillation, leaving the absolute alcohol to come over last. The operation may be continuous. Two other dehydrating agents used in industry are calcium sulphate, and potassium and sodium acetates in aqueous solution. Absolute alcohol can also be obtained by adding quicklime to the alcohol as it leaves the still, the quicklime combining with the water to form calcium hydrate.

ALCOHOL IN BEVERAGES. The amount of alcohol contained in alcoholic beverages is approximately as follows: brandy, 50 p.c. to 70 p.c.; gin, 25 p.c. to 50 p.c.; whisky and rum, 51 p.c. to 54 p.c.; beer, 2 p.c. to 6 p.c.; claret and hock, 8 p.c. to 10 p.c.; Chablis and Chianti, 9 p.c. to 12 p.c.; sherry and port, 15 p.c. to 20 p.c. Consumption of alcoholic beverages per head p.a. in the United Kingdom is approximately as follows: beer, 33.1 gallons; spirits, 0.2 gallons; wines, 0.3 gallons.

ALCOHOL IN THE SECOND GREAT WAR. The use of alcohol in the production of military weapons reached enormous proportions during the Second Great War. It was a necessary material in the production of smokeless powder, an antifreeze for tanks and aircraft, an ingredient in medical supplies, and a basic substance in the manufacture of numerous essential chemicals. The principal reason, however, for the vast

Alcohol. Section of a continuous steam still on the Coffey principle mentioned in the text

concentrating the alcohol, when the difference in the boiling points of the liquids allows of separation in the still.

The chief kinds of still employed in making alcohol are the pot still and the continuous still. The first form is the more primitive and is employed in preparing some kinds of whisky. The direct heat used in this still brings about certain alterations in the character of the wash which communicates distinctive flavours. The pot still is not adapted to the economical production of pure spirit. The continuous still is less expensive to use and involves much saving in time and labour. The fermented liquor is entirely deprived of alcohol in a continuous process, the spent wash and concentrated spirit leaving the still by the two separate exits.

One of the earliest continuous stills was that invented by Coffey in 1832. It consists of two tall columns, the one being the analyser and the other the rectifier. The

expansion in the manufacture of alcohol was its use as a basic material in the production of synthetic rubber (*q.v.*), necessitated by the loss of the Far Eastern natural rubber plantations. Approximately 127 million gallons of alcohol were used in the United States for this purpose in 1943. Buna-S, the principal synthetic rubber, was made from butadiene, a large proportion of which was prepared from alcohol.

INDUSTRIAL USES. In addition to its use in the form of beverages, alcohol finds application in industry in two main directions: (1) as a solvent and (2) as a raw material for chemical manufacture. By reason of its exceptional solvent powers, it is invaluable in making varnishes, lacquers, artificial silk, and celluloid. It is used in making fireworks, matches, dyes, perfumery, medicines, ether, chloroform, ethyl chloride and bromide, alkaloids, surgical dressings, disinfectants, photographic plates, insulin, liver extract, ethyl esters, acetone and acetic acid. It is a useful material in laundries and dyeworks, hospitals, laboratories and museums for the preservation of specimens.

ALCOHOLS IN CHEMISTRY. As already stated there are several classes of alcohols in chemistry, all being characterised by containing one or more hydroxyl (OH) groups. These are described as monohydric, dihydric, trihydric, and polyhydric, according to the number of hydroxyl groups present in them. A further distinction into primary, secondary, and tertiary alcohols is based upon differences in structure. The alcohol group of chemical compounds contains many substances quite dissimilar in appearance, *e.g.* mobile wood spirit; viscid, heavy glycerol; and solid, wax-like cerotin.

DUTY. The manufacture, sale, and distribution of alcoholic liquors has for long been subject to legal control in Great Britain and a large revenue is raised by duties on spirits. The Finance Act of 1940 provided for a duty on spirits of £4 17s. 6d. per proof gallon, to which, in the case of spirits warehoused for less than two years (immature spirits) was added 1s. 6d. per gallon under the provisions of the Finance Act, 1915. This surtax, however, was not charged on immature spirits used in making articles recognized as medicinal or for scientific purposes, and the concession was extended to the additional duties

imposed on spirits by the Finance Act, 1918, and the Finance Act 1920. This rebate was made by way of repayment of the additional duty which had to be paid in the first instance. Thus plain British spirits less than two years old would be charged the regular duty of £4 17s. 6d. plus 1s. 6d. immature spirits duty, and if used for a recognized medical or scientific purpose, repayment could be obtained of the duty in excess of 14s. 9d. per proof gallon. The Finance Act of 1943 increased the duty on spirits to £7 17s. 6d.

As the tax on spirits was many times the value of the spirits, it was impossible, owing to the cost, to use spirits industrially, and a demand arose in 1853 for duty-free alcohol for such use. In consequence an Act of 1855 was passed, allowing the use free of duty of methylated spirits, *i.e.* pure spirits denaturised with wood naphtha so as to be unfit for use as a beverage. In 1906 an allowance of 3d. per proof gallon was granted in respect of all alcohol deliveries for industrial purposes and that rate remained unchanged until 1921, when the allowance was increased to 5d.

During the Second Great War, in order that output for war purposes might not be impeded, certain restrictions on distillers were suspended by the Defence (General) Regulations, and in 1945 the restrictions on concurrent brewing and distilling contained in the Spirits Act of 1880 were permanently relaxed. At the same time power was given to the commissioners of customs and excise to replace such parts of the Spirits Act as had become out of date, thus providing for a more modern system of control. The allowances mentioned above were simultaneously withdrawn. The methylated spirits referred to above are now available for industrial and power uses in five varieties. See Distilling; Methylated Spirits; Rubber; Spirits, etc.

Alcoholism. Habit of taking alcoholic liquor to excess. It differs widely among different

racés, and it has been shown that the vice is least prevalent among nations which have known longest how to prepare drinks containing alcohol, and worst among those to whom it has been introduced recently.

While there is a racial factor in inebriety, much can be done to reduce the evil by control of the drink traffic, by education, and by encouraging a higher moral standard. The effects on the body of excessive indulgence in alcohol are serious, there being scarcely an organ or tissue which does not suffer directly or indirectly as a result of long-continued drinking. Delirium tremens is a form of acute alcoholic insanity, and complete mental breakdown may follow chronic alcoholism. Neuritis or inflammation of the nerves is another common effect. Alcoholism may produce "gin-drinker's" or "hobnail" liver, disorders of digestion, disease of the kidneys, and degeneration of the heart and arteries.

Treatment of alcoholism requires much patience and perseverance. Persons of strong will can sometimes break themselves of the habit, but most alcoholics require assistance by having alcohol placed for a time beyond their reach, or by living in a home for inebriates or with friends who can control them.

Alcoholometry. The measurement of the amount of ethyl alcohol in a liquid. In mixtures of alcohol and water alone this is done by finding the specific gravity by a Sikes's hydrometer and referring to standard tables giving the percentage of alcohol corresponding to the specific gravity. If the liquid consists of three or more different substances, it is sometimes possible to distil off the alcohol and measure this separately. In other cases volatile substances can be extracted by chemical means and the alcohol is then separated by distillation.

In Great Britain the strength of alcoholic liquors for excise purposes is stated by reference to proof spirit, a mixture of alcohol and water with a specific gravity of 0.91976 at 15.6° C., containing 57.1 per cent of alcohol by volume. Other strengths of spirit are described as being so many degrees overproof or underproof: thus a spirit of 20° overproof is such that 100 volumes of it must be diluted with 20 volumes of water to make it of proof strength.

Alcornoco Bark. Reddish-brown bark of a Brazilian tree of the pea family, *Bowdichia virgilioides*. This tree is abundant in the campos, and is of handsome appearance, the upper branches being clad with bright blue flowers. The bark is bitter and astringent, and colours the saliva yellow. It is used as a tonic, and was formerly prescribed in consumption.

Alcott, AMOS BRONSON (1799-1888). American educationist and philosopher. Born at Wolcott, Connecticut, Nov. 29, 1799, he turned from peddling books to school keeping in 1823. At his school at Cheshire, Connecticut, and at the Temple School, Boston, 1834-9, he introduced a number of reforms in the physical and mental training of the pupils on Pestalozzian lines, which aroused the hostile criticism of the press and of other schoolmasters. Alcott devoted the last fifty years of his life to philosophy, and was leader of the American Transcendentalists, a contributor to *The Dial*, and a friend of Emerson. He died at Boston, March 4, 1888. *See* Life, F. B. Sanborn and W. T. Harris, 1893.

Alcott, LOUISA MAY (1832-88). American authoress. She was born at Germantown, Pennsylvania, U.S.A., Nov. 29, 1832, the daughter of Amos Bronson Alcott, and was engaged for several years in teaching. Her first book, *Flower*

Fables, was published in 1855, but she first attracted attention by *Hospital Sketches* (1863), the record of her experience as an army nurse in the Civil War. Her *Little Women* (1868, second series 1869; dramatised version produced in London, 1919) made her famous. Her other works include *An Old-Fashioned Girl*, 1869; *Little Men*, 1871; *Good Wives*, 1871, and *Jo's Boys*, 1886. She died at Boston, March 6, 1888. *See* Life, Letters and Journals, ed. E. D. Cheney, 1889; Life, B. Moses, 1909.

Alcoy. Town of Spain, in Alicante province. The terminus of two small rlys., it is 24 m. N. of Alicante, and is built in a mt. gorge. It is hemmed in by streams which supply power for cloth, match, and cigarette factories. Pop. 45,857.

Alcuin or ALBERNUS (735-804). English scholar and theologian. He was born at York, and was educated at the cloister school

Alcuin. Frontispiece to the Alcuin Bible, a Latin version produced at Tours c. 840. It shows the evangelists and their emblems with Alcuin (centre)

British Museum

under Egbert and Ethelbert, in 778 succeeding Ethelbert as master. In 781, at the invitation of Charlemagne, he established a school in the imperial palace at Aix-la-Chapelle, which under his care became a famous seat of learning. For his services Charlemagne bestowed on him the abbey of Ferriers in Gatinais, S. Loup at Troyes, and S. Martin at Tours. In 790 he was in England on a political mission. Returning in 792 to his scholastic work on the continent, he defended the faith against the Adoptionist heresy of Felix and Elipand. He retired in 796 to Tours, where he founded a school. From Tours he corresponded with Charlemagne, and he died there May 19, 804.

Theologian, philosopher, orator, historian, and poet, Alcuin was the foremost scholar of his time. His works, which include a life of S. Willibrord, were printed in 1777 at Ratisbon. *See* Lives by A. F. West, 1893, and C. J. B.

Gaskoin, 1904; Schools of Charles the Great, J. Bass Mullinger, 1877.

Alcyone. Star η Tauri, one of the Pleiades. It is called after the daughter of Atlas and Pleione, and is of the third magnitude.

Alcyone (Greek, kingfisher). In Greek mythology, daughter of Aeolus, the wind-god, and wife of Ceyx, son of Heosphorus, the Morning Star. In their pride husband and wife called themselves Zeus and Hera and were changed by Zeus into sea-birds. In a variant legend Ceyx was drowned on a voyage, his body was found on the shore by his wife, and the gods, pitying her sorrow, changed both into kingfishers. For seven days during winter she broods over the sea, while her father causes all the winds to cease and calm to reign, this being the origin of the phrase halcyon days.

Aldbrough. Village in the W. Riding of Yorkshire, England. It is 1 m. E. of Boroughbridge railway station and lies 16 m.

N.W. of York. It returned two members to Parliament from Elizabeth's time until 1832, when it was disfranchised. It has many remains of Isurium, the supposed capital of the Brigantes.

Aldebaran. Star α Tauri, the Follower (of the Pleiades). A shade less bright than first magnitude and conspicuous for its ruddy colour, it is the chief object in the group of the Hyades, its intrinsic light being some 95 times that of the sun.

Alde. River of Suffolk, England. Rising at Brundish, it flows S.E. to Rendham and Stratford St. Andrew, almost meeting the sea at Aldeburgh (*v.i.*). A strip of shingle then cuts it off from the coast, and it flows several miles S. to Hollesley Bay below Orford. This last stretch is the subject of a poem by John Freeman.

Aldeburgh OR ALDEBOROUGH. Mun. borough and seaside resort of Suffolk, England. It is on the Alde estuary, 99 m. E.N.E. of London on the railway. A fishing centre, with a half-timbered 16th century moot hall, Aldeburgh was an important town in the 16th century. It was the birthplace of the poet Crabbe, and a favourite resort of Edward Fitzgerald and George Meredith. In 1832 it was disfranchised. In 1908 Mrs. Garrett Anderson was elected mayor of Aldeburgh, being the first woman in England to hold mayoral office. Pop. 2,480.

Aldehydes. Series of organic compounds, mostly liquids, intermediate between the primary alcohols and carboxylic acids, obtained by the oxidation of the primary alcohols. The simplest member is formaldehyde, followed by acetaldehyde. Formaldehyde (formalin, methyl aldehyde, methanal) is an irritating gas, but is usually in solution (40 per cent). It is made by passing methyl alcohol and air over certain metals, or by the dry distillation of calcium formate. Acetaldehyde (aldehyde, ethanal) is a colourless, inflammable liquid with a pungent odour. It can be made by acting on alcohol with potassium dichromate or manganese dioxide and sulphuric acid, but is obtained on a large scale from alcohol and acetylene. It is used as a solvent. See Acetic Acid: Alcohol; Formalin.

Alden, JOHN (c. 1599-1678). One of the Pilgrim Fathers. In 1620 he sailed as a cooper in the Mayflower, and settled at Duxbury, Massachusetts, where for more than forty years he served

as magistrate and sometimes as acting governor. In 1623 he married Priscilla Mullins, whom he had originally courted for his friend Miles Standish—the subject of Longfellow's poem. He died at Duxbury, Sept. 12, 1678. See Pilgrim Fathers.

Aldenharn. Village of Hertfordshire, England, 3 m. from Elstree railway station on the main line from St. Pancras, but less than 1 m. to the N. of Watford by-pass. The old church, dating from the 12th cent., was damaged by German bombs in Oct., 1940. Aldenharn school, founded 1597, has a modern chapel, dedicated 1938. Aldenharn House, with famous gardens, originally belonged to Henry Hucks Gibbs (1819-1907), merchant and banker, who was created 1st baron Aldenharn in 1896. During the Second Great War the house was taken over by the B.B.C.

Alder (*Alnus glutinosa*). Small tree that is common in Europe, by riversides and in fens and marshes. It also grows in moist oakwoods away from streams. Its natural range is confined to the northern hemisphere, and it is usually from 20 ft. to 40 ft. in height. The leaves vary from broad oval to round with wavy and toothed margins, and when young are hairy and sticky.

Flowers are produced in catkins. Those containing male flowers being long and pendulous like those of the hazel, while those with female flowers are short and oval. They are formed late in summer, but do not reach maturity until the following March, when they become very conspicuous on the leafless tree. The scales of the female inflorescence become woody, so that the fruit bears a resemblance to a miniature fir-cone. It does not discharge its seeds until the following spring. The roots of the alder bear nodules like those produced on the roots of leguminous plants by nitrate-forming bacteria. Alder wood is light and soft, red when freshly cut, pinkish when dry. If kept constantly moist or submerged it is very durable. Its charcoal is esteemed by gunpowder makers.

Alder-fly (*Sialis*). Name of a family of neuropterous insects related to scorpion flies. The

European alder-fly (*S. lutaria*) passes its larval stage in the water, and is about an inch long. About

Alder-fly. Male specimen of the giant alder-fly (*Corydalus*), Central America

May it leaves the water and buries itself in the ground, where it passes the pupal stage. A few weeks later it emerges as the perfect insect—known to anglers as a good bait for fly-fishing.

Alderman. Word of Anglo-Saxon origin meaning elder man, applied to certain members of town and county councils in England and Wales, and to members of municipal bodies in the U.S.A. and Canada. The Municipal Corporations Act of 1835 established the principle that in England and Wales aldermen should be members of town councils chosen by the councillors. In all English municipalities, except the City of London, the proportion is one alderman to every three councillors, the term of office being six years. For the corporation of the City of London there are 26 aldermen chosen for life.

Alderney (Fr. *Aurigny*, Lat. *Riduna*). The most northerly of the Channel Islands. It is 8 m. W. of Cap de La Hague on the French mainland, from which it is separated by the dangerous Race of Alderney.

Comprising 1,962 acres, it is 4 m. long and $1\frac{1}{2}$ m. wide. Off the W. coast are the perilous Casquet rocks, with three lighthouses. From precipitous cliffs W. and S., of which the highest point is 306 ft., the land slopes down N. and E. to sandy bays. St. Anne, the only town, is situated in the centre. Legislation is in the hands of an elected states, justice in those of a court appointed by the crown. It is a British possession and a dependency of Guernsey. French ceased to be the official language in 1949, being little spoken. The climate is healthy. A blue granite is quarried and exported, but the

Alder. Left, reddish catkins and right, leaves and fruit

chief wealth of Alderney is in its breed of small but excellent cows. Pop. (pre-war) 1,521. The island was occupied by German forces at the beginning of July, 1940. The majority of the inhabitants abandoned their homes and, with refugees from Jersey and Guernsey, made their way to England. The rest, with the exception of one family which refused to move, were deported by the Germans, who turned the whole of Alderney into a strongly fortified garrison and prison camp. The island was liberated by British forces on May 16, 1945, 3,200 Germans being taken prisoner.

Aldersgate. Name of a ward of the City of London and of a street running N. from St. Martin's-le-Grand to Goswell Road. The old gate at the S. end of the street was the N. gate of the city, and is supposed to have been erected by one Aldrich, a Saxon. Rebuilt in 1618 and damaged in the Great Fire, it was finally razed in 1761. John Day, the 16th century publisher, lived over the gate. Notable residents of Aldersgate Street included Mary countess of Pembroke, and Milton. In the grounds of S. Botolph's is Postman's Park, where G. F. Watts inaugurated in 1900 memorial tablets to heroes who gave their lives while performing civilian duties. Wide areas on both sides of Aldersgate Street were devastated as the result of German incendiary and H.E. bombs, 1940-41, particularly on the night of Dec. 29, 1940.

Aldershot. Municipal bor. of Hampshire, England. Situated on the immediate boundaries of Hampshire and Surrey, 34 m. S.W. of London by rly., its charter of incorporation was granted in 1922. The constitution of the borough council is unique in that three of its members are military officers serving in the adjacent camp and nominated to the council by the under-secretary of state for war. That Aldershot has grown from a village with 875 inhabitants in 1851 to a town with a pop. of 34,281 in 1931 is due to the establishment of this large camp.

Just as Shorncliffe camp, near Folkestone, was selected for its strategic position during the Peninsular War, and

Catterick, near Richmond, Yorks, developed from the exigencies of the First Great War, so Aldershot owes its inception to the Crimean War.

As a result of that campaign, it became evident that the regular army would have to establish camps where training facilities existed for the practical training of troops in the field. Lord Hardinge, then C.-in-C., urged for this purpose the purchase of waste land known as Aldershot Heath. In 1854 the War Office was granted £100,000 for the erection of the camp, and in 1855 the provision began of a camp of wooden huts. It was not until some 25-30 years later that more permanent accommodation was provided.

Until 1941 Aldershot was recognized as the chief training command of the British Army. A number of factors, including the possibility of S.E. England being an invasion area, were responsible for the loss of some of Aldershot's military importance. It was reduced in status in 1941 from command to district, becoming the headquarters of Aldershot and Hants district under G.O.C. Southern Command. In the Aldershot area are two sub-districts, North and South Aldershot. South Aldershot, separated from North Aldershot by the Basingstoke Canal, includes Wellington and Stanhope Lines, with barracks at Bordon, Longmoor, and Whitley, and a number of camps erected during the Second Great War. North Aldershot consists of Marlborough Lines, with barracks at Black-

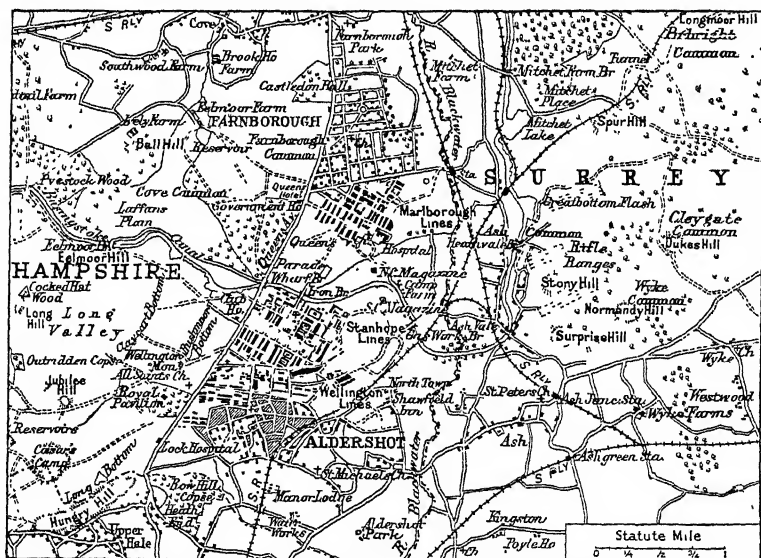

down, Deepcut, Cove, and Crookham, and a few scattered camps.

Accommodation is now provided for some 60,000 troops as compared with 20,000 in 1914. The garrisons are complete with all ancillaries for their maintenance—supply stores, butchery, bakery, electric power and water plants, workshops, offices, churches, and some 1,700 quarters for families of married soldiers. Amenities are also on a generous scale.

It was from Aldershot that the first division of the B.E.F. left for France in 1914; 25 years later the 1st and 2nd divisions of the B.E.F. also left Aldershot for France. During the Second Great War, the average pop. of N. and S. Aldershot sub-districts was 125,000. All Canadian divisions were successively accommodated in Aldershot on arrival in the U.K. From the fall of France to the end of the war, one camp was permanently allotted to the Fighting French. Aldershot also accommodated one of the greatest concentrations of the A.T.S. in the country, an average of some 7,000 women. Other commitments included a New Zealand div. and a Polish armoured div.

Aldershot gives its name to a county division returning one member to Parliament.

The colossal equestrian statue of Wellington, by Matthew Wyatt, on the W. side of Queen's Avenue, originally surmounted an arch opposite Hyde Park Corner, London. It was removed to Aldershot in 1883.

Aldershot : Plan of Britain's premier military camp and army training ground

Alderson, Sir Edward Alfred Hervey (1859–1927). British soldier. Born April 8, 1859, he served with the Mounted Infantry in South Africa in 1881–2, and in the Egyptian campaigns of 1882 and 1884–5. He was in the Mashonaland in 1896, and commanded the Mounted Infantry in S. Africa, 1900–1. After further service in India, he commanded the Canadian division in France during the First Great War, directing it at the second battle of Ypres. When a Canadian Corps was formed he was placed at its head. In 1916 he was made a K.C.B. He died Dec. 14, 1927.

Aldgate. Ward and street of the City of London. The street connects Fenchurch Street with Whitechapel. The old gate was the extreme E. gate of the city; in 1606 it was taken down and rebuilt, being removed finally in 1761. It was at this gate, in 1471, that Faulconbridge was repulsed when attempting to storm London. Chaucer lived in rooms over the gate and John Stow, the antiquary, close by. Aldgate's chief existing relic is the pump, now a drinking-fountain at the W. end of the street. Trolley-bus routes from E. London terminate at Aldgate, and there are two stations, Aldgate and Aldgate East, on the Met. and District rlys. respectively.

Buildings and property in Aldgate suffered considerable damage from German air-raids in both the First and Second Great Wars.

Aldhelm (c. 640–709). English saint, bishop, and scholar. Educated under an Irish monk named Maildulf at Malmesbury and the African scholar Hadrian at Canterbury, he succeeded Maildulf as abbot at Malmesbury about 676, was made bishop of Sherborne in 705, and died May 25, 709. Aldhelm was a skilful architect, and the foundation of the Saxon church of S. Lawrence at Bradford-on-Avon, Wiltshire, has been attributed to him. His writings include the famous riddles in Latin hexameters embodied in a treatise on Latin prosody, Latin verses, and a Latin treatise addressed to the nuns of Barking.

Aldin, Cecil Charles Windsor (1870–1935). British artist. Born at Slough, April 28, 1870, he became well known as a lively delineator of animals, especially dogs and horses. He illustrated Kipling's jungle stories on their first appearance in *The Pall Mall Budget*, 1894–5. His colour-prints of hunting scenes achieved a wide

popularity, as did his illustrations to *A Dog Day*, *The Pickwick Papers*, and *Handley Cross*. He died Jan. 6, 1935.

Aldine Editions. Small octavo or duodecimo editions of the Greek, Latin, and Italian classics printed at Venice, 1494–1597. They were

Aldine. First mark of the Aldine Press

issued from the press in the Campo di S. Agostino founded by the scholar-printer Aldus Manutius, for whom Francesco of Bologna designed the type known as cursive or italic, first used in a Virgil of 1501. Aldus began a revolution in book printing, which combined cheapness, accuracy, and portability with elegance of form, and dominated the 16th century, many counterfeit Aldines being printed at Florence and Lyons. The Aldine mark (see illus.) was adopted in 1830 by William Pickering and adapted later by Bell and Daldy and their successors, George Bell and Sons. See *Manutius, Aldus*.

Aldington, Richard (b. 1892). British writer. He won early reputation as a poet, becoming associated about 1914 with the Imagist group. Later he published critical works, but it was a war novel, *Death of a Hero* (1929), which attracted the most general notice. Later books include *The Colonel's Daughter* (1931), *The Eaten Heart* (lyrics, 1931), *Rejected Guest* (1939), and a biography of Wellington (1946).

Aldis Lamp. A signalling lamp used by the armed forces to transmit messages by Morse code. It is portable and is electrically operated. A handle is provided and to this are fitted two triggers. One of these, when depressed, switches on the 12-volt-36-watt bulb and the other trigger causes a pivoted reflector housed inside the lamp to articulate. In this way the beam moves through an angle of 9 degrees with the result that the receiver of the signal sees the light only when the trigger is pressed down. An aeroscope or telescope is attached to the top of the lamp for the purpose of sighting the lamp when messages are being sent. It can be used in daylight as well as at night at the rate of 30 words a minute.

Aldred (d. 1069). English prelate. A monk of Winchester, he was made abbot of Tavistock

about 1027 and bishop of Worcester in 1044. He went on several diplomatic missions, and visited Jerusalem in 1058. In 1060 he was appointed to the archbishopric of York, which he held jointly with the see of Worcester until compelled to resign the latter by Pope Nicholas II. He crowned William the Conqueror in 1066. The money he acquired was largely devoted to church building and to the endowment of monasteries at York, Beverley, and Southwell.

Aldrich, Henry (1647–1710). English logician and theologian, dean of Christ Church, Oxford. His *Compendium of Logic* long remained the standard text-book. He designed Peckwater Quad and other Oxford buildings, and wrote the well-known Hark, the Bonny Christ Church Bells.

Aldrich, Thomas Bailey (1836–1907). American writer and humorist. He was born at Portsmouth, New Hampshire, Nov. 11, 1836, and

entered business in New York in 1854. Three years later he took to journalism. He was editor of *The Atlantic Monthly*, 1881–90. His light verse is best represented in *The Ballad of*

Babie Bell, 1856, and *Cloth of Gold and Other Poems*, 1874. His stories include *Marjorie Daw and Other People*, 1873, *Prudence Palfrey*, 1874, *The Queen of Sheba*, 1877, and the once very popular *Story of a Bad Boy*, 1870. He died March 19, 1907. See *Life*, F. Greenslet, 1908.

Aldridge, Ira Frederick (c. 1804–67). American actor, called the African Roscius. According to some accounts he was a mulatto born at Baltimore, and was apprenticed to a ship's carpenter. Others state he was a full negro, son of a New York minister, and was born in New York, and trained for the ministry. In 1826 he became valet to Edmund Kean, who was then in America, and accompanied him to England. The association prompted him to go on the stage, and he returned to America in 1830, making his début at Baltimore. His first appearance in London was as Othello at Covent Garden in 1833. Between 1852–9 he toured Germany, Austria, and Russia. He died of typhus fever at Lodz, Poland, Aug. 7, 1867.

Thomas Bailey Aldrich

Aldringer, JOHANN, COUNT VON (1588-1634). German soldier. Born at Thionville, Lorraine, he entered the Spanish army, 1606, and when, in 1618, the Thirty Years' War began, he took service under the emperor Ferdinand II. Aldringer fought against the German Protestants, the Swedes, and the French, his reputation among the Imperialist generals being inferior only to those of Wallenstein and Tilly, under both of whom he served. He was killed at Landshut, Bavaria, July 22, 1634.

Aldwych. London thoroughfare, opened by Edward VII, Oct. 18, 1905. It runs convexly from

and considerable superficial damage to buildings. *See* Kingsway.

Aldwych Club. London club founded in 1911 as a social centre for advertising men. In 1914 it became a general business club. The subscription is 6 gs. a year. The club house is 18, Exeter Street, Aldwych, W.C.

Aldwych Theatre. London playhouse, built by (Sir) Seymour Hicks and opened Dec. 23, 1905, with a revival of his own play for children *Bluebell in Fairyland*. From 1925 to 1933 the theatre was noted for a continuous series of farces, eleven in number, all but two of which were written by Ben Travers. They included *A Cuckoo*

in the Nest, Rookery Nook, Thark, and Turkey Time, and the same principals, Ralph Lynn, Tom Walls, J. Robertson Hare, and Mary Brough were retained for all of them.

Ale. Name given to all malt liquor in England before the introduction of hops in the 16th century. It is now applied

to lighter coloured beer. *See* Beer; Brewing.

Aleander, HIERONYMUS, OR GEROLAMO ALEANDRO (1480-1542). Italian humanist and cardinal. Born at Motta, near Treviso, he was early distinguished for scholarship, and after acting as rector of the university of Paris was

sent by Eberhard, prince-bishop of Liège, to Rome. In 1519 he became librarian of the Vatican. A strong opponent of Luther, against whom he prepared the imperial edict, he endeavoured to check the reform movement in the Netherlands. He was made archbishop of Brindisi in 1524 and a cardinal in 1536.

Aleardi, ALEARDO (1812-78). Italian poet. Born at Verona. Nov. 4, 1812, he became a professor at the Academy of Fine Arts, Florence. His work is notable rather for graceful description than for force of sentiment or emotion. At Verona, where he died, July 17, 1878, a monument has been erected to his memory and a bridge named after him.

Alecto. In Greek mythology, one of the Furies. She is represented with a flaming torch and serpents crawling about her head. *See* Eumenides.

Alekhine, ALEXANDER (1892-1946). World chess champion. A naturalised Frenchman since 1927, he was born in Moscow, Nov. 1, 1892, the son of a noble-

man. He left Russia during the 1917 revolution. His extraordinary mastery of chess was evident in boyhood, and after excelling in several tournaments he defeated J. R. Capablanca (*q.v.*) for the world championship in 1927. He held the title till 1935, lost it then to the Dutchman Max Euwe, and regained it in 1937. At the San Remo tournament in 1930 he set up a world scoring record. He was found dead in Lisbon, Mar. 24, 1946.

Alemán, MATEO (1547-c. 1609). Spanish novelist. Born and educated at Seville, he entered the public service in 1571, and after a somewhat troubled life migrated in 1608 to America, probably to Mexico. His fame rests on his long and popular novel *Guzman de Alfarache*, 1599-1604, which, although impeded by a tendency to moralise, gives a wonderful picture of contemporary Spain.

Alemán, MIGUEL (b. 1902). Mexican president. *See* N.V.

Aleman. Alternative form of Alamanni, a confederation of German Danubian tribes in continuous conflict with the Roman empire during the 3rd and 4th centuries A.D. *See* Alamanni.

Aldwych Plan or the London thoroughfare superimposed on a map showing the old landmarks which it displaced

the Strand, diverging N.E. at the intersection of Wellington Street and returning near S. Clement Danes. Among the buildings of the island block thus formed are Australia House (1918), India House (1930), and Bush House (1923-34). Aldwych is now a one-way street, for eastbound traffic only. The name is derived from the Danish settlement that once occupied the site. It had already been perpetuated in Wych Street, but this, with the parallel Holywell Street (or Booksellers' Row), was demolished in the improvements. On June 30, 1944, a German flying bomb fell at the junction of Aldwych and Kingsway in the early afternoon, causing many casualties

to lighter coloured beer. *See* Beer; Brewing.

Aleander, HIERONYMUS, OR GEROLAMO ALEANDRO (1480-1542). Italian humanist and cardinal. Born at Motta, near Treviso, he was early distinguished for scholarship, and after acting as rector of the university of Paris was

Alembert, JEAN LE ROND D' (1717-83). French mathematician and philosopher. He was founder and joint

Jean d'Alembert, French philosopher
After de la Tour

editor, with Diderot, of the great French encyclopedia. D'Alembert contributed the introduction, in which are discussed, in the manner of Francis Bacon and Locke, the origin and classification of the sciences. His treatise on dynamics enunciated an important principle still known by his name. D'Alembert was a sceptic and relativist, who held that we can only know the relations of phenomena as they appear to us, not their causes. The nature of matter and mind is unknown; all knowledge is derived from sensation. His ethical principles are enlightened self-interest and utilitarianism. He declined an offer from Frederick the Great to settle in Berlin and also an invitation from Catherine II of Russia to undertake the education of her son. With Frederick, as also with Voltaire, he kept up a constant correspondence. He died in Paris, Oct. 29, 1783. See Encyclopedia.

Alembic (Arab. *al*, the; *anbig*, still). Apparatus of glass or metal for distilling. Now superseded, it consisted of a pear-shaped vessel, the *matrass*, which contained the substance to be distilled; a head or capital, another vessel imposed on the former to receive and condense the vapour; and, branching from it, the third part, a long inclined tube which carried the spirit into the receiver. See Retort.

Alemtejo (Portuguese, beyond the Tagus). Largest old province of Portugal. Bordered N. by the Tagus and S. by Algarve province, its area is 9,219 sq. m. Traversed by mts. and the Guadiana, Sado, and other rivers, it is varied in surface and climate. The fertile areas produce maize, rice, grapes, olives, and figs; copper, iron, and marble are found; there are several mineral springs; and pigs, horses, goats, and sheep are reared. The province, which is served by three main rly. lines, comprises the districts of Portalegre, Evora, and Beja. The chief towns are Evora, Elvas, Portalegre, Estremoz, and Beja. Pop. 669,766.

Alençon. Town of France. The capital of Orne department, it stands on the river Sarthe and is

67 m. by rly. S.S.E. of Caen. Its Gothic church of Notre Dame dates from the 16th century. The ramparts have been replaced by boulevards, and the remains of the castle, two 15th century towers, are used as a prison. Alençon was noted for its lace and also for its crystals and cut quartz, called Alençon diamonds, industries now decadent. It manufactures textiles, straw hats, artificial flowers, etc. Pop. 16,688.

The town gave its name to several lines of French nobles. The first count of Alençon was Yves, lord of Bellême, who fortified the town about 943. The second line sprang from the marriage in 1070 of Mabile, heiress of Yves II, to Roger of Montgomery, one of the companions of William the Conqueror, and became extinct with Robert IV, when it reverted

Anglo-U.S. forces invaded France in 1944, the Americans employed strong tank formations in their thrust N. from Le Mans, which, supported by powerful air cover, were reported to have by-passed Alençon on Aug. 12 in a lightning offensive to cut off the German 7th army, subsequently trapped in the Falaise "gap."

Aleppo (Gr. *Beroea*, Arab. *Haleb*). City of Syria. It is the capital of Aleppo sanjak, and lies in a fruitful valley watered by the Kuweik, 70 m. E. of the Mediterranean, on the Adana-Damascus Rly., and is also connected by rly.

Alençon. The town hall, and (above) remains of the 15th century castle of the dukes

to the crown. The countship was given as an appanage in 1268 to Louis IX's son Peter, and in 1293 to Charles of Valois, whose second son Charles, the founder of the third line, received it from his brother Philip. In 1367 the countship was converted into a peerage and in 1414 into a dukedom, which passed to the crown in 1525. In 1559 Catherine de' Medici received it as a dowry (one of her sons wooed Queen Elizabeth of England as duke of Alençon), and it was granted by Louis XIV to Gaston of Orleans, and later by Louis XVI to his brother Louis, afterwards Louis XVIII, in 1785. The title was borne by Ferdinand of Orleans, grandson of Louis Philippe.

During the German occupation of France, 1940-44, Alençon came under Nazi domination. When the

with Iraq. Through its port of Alexandretta (*q.v.*) it conducts a large foreign trade in silk, cotton, wool, damascened and leather goods, rugs, soap, tobacco, cereals, oil, wine, and fruit, and has a medieval castle, a citadel,

and several fine mosques. On the fall of Palmyra Aleppo became a great centre of trade between Asia and Europe. Several times besieged and sacked, it has also suffered by earthquakes and epidemics. During the First Great War the town was the headquarters of von Falkenhayn while commander-in-chief of the Turkish armies, and was occupied by the British on Oct. 26, 1918. During the Allied invasion of Syria in June-July, 1941, the German-controlled airfield at Aleppo was heavily bombed by the R.A.F. The sanjak extends between the Mediterranean Sea and the Euphrates. Pop. of city 320,167.

Alessandria. City and fortress of Italy. Situated on the Tanaro, 56 m. by rly. E.S.E. of Turin, it is the capital of Alessandria province and the seat of a bishop. It was

Aleppo. An ancient Syrian trade centre, Aleppo has suffered many vicissitudes, including sieges, earthquakes, and epidemics. The old fortress (right background) is set on an isolated hill. See p. 278

founded in 1168, and named after Pope Alexander III. In 1174, it withstood a six months' siege by Frederick Barbarossa. Ceded to Savoy in 1713, its citadel, built in 1728, was enlarged by the French in 1800-14 and destroyed by the Austrians in 1815. Its present cathedral dates from 1823 and its academy from 1562. Alessandria is an important rly. junction, and has manufactures of macaroni, linen, silk, woollen goods, and candles. Pop. 79,327. See Marengo.

Aletsch. Glacier of Switzerland, the most extensive icefield in the country. Formed chiefly of the snows of the Jungfrau and the Altschhorn, it is on the S. slope of the Bernese Alps and is nearly 13 m. long. The Aletschhorn, the second highest summit of the Bernese Alps, is 13,770 ft. high.

Aleutian Islands OR CATHERINE ARCHIPELAGO. Chain of about 150 islands extending in curved formation W. from the peninsula of Alaska. They cover a distance of 1,250 m. towards the Komandorskie (Commander Islands), off the E. coast of Kamchatka. The islands, most of which belong to the U.S.A. territory of Alaska, are bare and rocky, and contain numerous volcanic peaks, active and dormant. Unimak, nearest the mainland, and Unalaska are among the largest. Foxes, reindeer, dogs, and other mammals abound, but are decreasing in number; and the whale, seal, and otter fisheries are declining. The inhabitants are principally Aleuts, a branch of the Eskimo race, and belong to the Greek Church. The climate is moist and the temperature moderate. The islands were discovered by Bering and Chirikov in 1741.

In 1928 the McCracken-Stoll expedition found on one of the islands the mummified bodies of three adults and a child of the Stone Age. The bodies were in a perfect state of preservation. The clothing was intact, as were the

domestic articles, hunting weapons, and other paraphernalia which were buried with them.

With the outbreak of war between the U.S.A. and Japan in Dec., 1941, possession of the Aleutians was immediately recognized by both sides as of immense strategic value. They form the shortest route across the Pacific to Japan, though Dutch Harbor, on Unalaska, used by the U.S. as a supply base, is 2,300 m. from Tokyo. Japanese invaders attacked Dutch Harbor in June, 1942, but were forced back by air attack. Nevertheless in the same month the Japanese established footholds on the westernmost islands of Kiska and Attu. They remained there for about a year, under regular observation and attack from the air. In May, 1943, U.S. troops landed on Attu and destroyed the Japanese garrison after a struggle lasting three weeks. The Japanese on Kiska, now outflanked, withdrew, and with the occupation of that island by U.S. and Canadian forces in Aug., 1943, the whole Aleutian chain not only came once more

under allied control but was developed as a base for offensive operations against Japan, with airfields and other military installations, at an earlier date and on a greater scale than if the Japanese had made no move in that region.

Ale Water. River of Selkirkshire and Roxburghshire, Scotland. It flows 24 m. N.E. and E. to the Teviot, is a trout stream, and has falls in its upper course.

Alewife. Small fish, occurring chiefly in the sea, rivers, and lakes of N. America. In length from 8 ins. to 10 ins., it is related to the shad and herring, resembling the former in colour and shape. In the U.S.A. it is used for food and is exported in large quantities. The name is due to a fancied resemblance to the alewife, a corpulent female beer-seller. French-Canadian fishermen call it gaspereau.

Alexander. The name of eight popes, the three most important of whom are noticed separately. Of the remainder, Alexander I was bishop of Rome A.D. 107-116, and was canonised as a saint. Alexander II was pope 1061-73; he was chosen owing to the influence of Hildebrand and was opposed by an antipope, Honorius II, whom at length he overcame. Alexander IV, pope 1254-61, failed in his attempt to unite the Greek and Roman Churches. He quarrelled with King Manfred of Sicily and the Ghibelline party, assigned the two

Aleutian Islands. Showing their strategic position in relation to Japan

Sicilies to Edmund of Lancaster, son of Henry III, and was driven to Viterbo, where he died. Alexander V was pope for less than a year, 1409-10, and had high repute as a scholar. Alexander VIII, pope 1689-91, bought for the Vatican the library of Queen Christina of Sweden.

Alexander III (d. 1181). Pope from 1159-81. Created a cardinal in 1150, Orlando Bandinelli of Siena was appointed papal chancellor in 1153 and was conspicuous as an opponent of the emperor, Frederick I. When he was elected pope, a rival was chosen by a minority of the cardinals as a nominee of the emperor, and during the ensuing struggle Alexander was twice driven from Rome. By the peace of Venice in 1177 the emperor, his chief foe, was compelled to recognize him, and kneeling before the pope received his pardon. Alexander III supported the cause of Becket against Henry II, and after that prelate's murder in 1170 made the English king do penance. He also presided over the third Lateran council of 1179,

when the law requiring a two-thirds majority of the cardinals for the election of a pope was passed. Just before his death, Aug. 30, 1181, again an exile from Rome, he excommunicated William the Lion and placed Scotland under an interdict.

Alexander VI (1431-1503). Pope from 1492 to 1503. By birth a Spaniard, being born in a village near Valencia in Jan., 1431, he was related through his mother to Alphonso de Borgia, or Borgia, who in 1455 became pope as Calixtus III. Taking this name in preference to that of his father, he was known as Rodrigo Borgia. He was made archbishop of Valencia and vice-chancellor by his uncle Calixtus, and cardinal by Sixtus IV. When Innocent VIII died in 1492, Borgia was a candidate for the vacancy, and by bribery on a large scale was chosen.

Before this event Alexander had become the father of five children by Vannozza dei Cattani—Caesar Borgia, three other sons, and Lucrezia. His object in life was to provide for these children, and, as

Ranke asserts, "how the pope would proceed, in regard to the marriages, endowments and advance of his children, became a question affecting the politics of all Europe." Caesar Borgia was even more unscrupulous than his father, and between them they worked for the destruction of their enemies, the increase of their own power, and the unity of Italy. The noble families who flourished on the papal territories, the Orsini and others, were attacked and stripped of their estates, while money was obtained in every possible way to be expended on art and literature, on government, and on pleasure. It was the period of the Renaissance, when even murder had its place among the arts.

In order to strengthen the papacy, Alexander mixed in the feuds which disturbed Italy. In 1493 he arranged a very powerful alliance against Naples, and while making terms with Charles VIII of France, when he invaded that country in 1494, he strove secretly to expel him, and at length, after forming a league against him, was successful. The ascendancy gained by Savonarola at Florence interfered with his plans, and after a contest the pope was victorious and the Dominican reformer was put to death. Alexander made use of the Inquisition for political ends, refusing to allow any persecution of the Jews in Rome, and issued in 1492 the bull which divided the New World between Spain and Portugal. When he died, of fever, Aug. 18, 1503, it was commonly believed, on quite insufficient evidence, that his end had been caused by drinking accidentally a goblet of poisoned wine, prepared by his commands for a cardinal who was his guest. See Renaissance in Italy, J. A. Symonds, 1875-86; History of the Papacy, Mandell Creighton, 1882-94.

Alexander VII (1599-1667). Pope from 1655-67. Fabio Chigi was born at Siena in 1599. Before his elevation he was secretary to Innocent X, and his rule was distinguished by his encouragement of literature and art and by the architectural improvements carried out at Rome. He came into collision with Louis XIV, and Avignon was lost to the papacy.

Alexander (1893-1920). King of Greece. Born Aug. 1, 1893, he was the second son of King Constantine and of his wife Sophia, a sister of the ex-Kaiser William II. When Constantine was compelled to abdicate, the Entente Powers signified their inability to recognize

Alexander VI. Rodrigo Borgia, who took the name of Alexander, was conspicuous for his unscrupulousness and for his patronage of the fine arts

Alexander, king
of the Hellenes

The crown prince George, and Alexander was chosen in his stead. He ascended the throne, June 13, 1917, and died Oct. 25, 1920, from the bite of a pet monkey.

Alexander. Name of five kings of Macedonia, the third being Alexander the Great. Alexander I (498-454 B.C.), son of Amyntas I, accompanied Xerxes on his expedition against Greece. But his sympathies were with the Greeks, and before the battle of Plataea (479) he betrayed the positions of the Persian army. Greece gave him the name of Philhellen, and

admitted him to the Olympic games. Alexander II (369-367), the son of Amyntas II, after a successful campaign waged against Alexander of Pherae, engaged in a struggle with his half-brother, Ptolemy Alorites, by whom he was assassinated. Alexander IV, Aegus, was the posthumous son of Alexander the Great by Roxana. He was under the care of different guardians until 316, when he was imprisoned by Cassander, who put him to death in 311. Alexander V (297-294), son of Cassander, quarrelled with his brother Antipater about the throne, and accordingly sought the aid of Demetrius Poliorcetes. Before the latter arrived, the brothers were reconciled. Alexander was murdered by Demetrius, whose help he scornfully refused.

ALEXANDER THE GREAT: 356-323 B.C.

An account of the life of the famous conqueror, who established the first of the world's great empires. For related information see also Afghanistan; Alexandria; Greece; Macedonia; Persia; Phoenicia; Syria

Alexander the Great was the son of Philip II, king of Macedonia, whom he succeeded on his assassination in 336 B.C. Educated by Aristotle, he was richly endowed with natural abilities, physical strength, immense energy, and ambition, and he brilliantly distinguished himself when only sixteen at the battle of Chaeronea. He promptly displayed his quality

by crushing first the risings of his own northern tribes, then a threatened revolt among the Greeks.

Twelve months after Philip's death, his son's supremacy was completely established. Early in 334 Alexander crossed the Hellespont (Dardanelles) with an army, to carry out Philip's projected conquest of the Persian empire.

Darius of Persia, the "great king," was lord of all western Asia and of Egypt, though Egypt and the Greek cities on the coast were ready to break away from

Alexander the Great attacking Poros, King of India, (on an elephant) at the Battle of Hydaspes
From 4th cent. coin in British Museum

the Persian yoke. Vast hosts were under his control, but Alexander had at his disposal the famous Macedonian army and the Greek soldiery. His scheme of conquest was systematic and thorough, though it depended upon calculated audacity. Asia Minor, the hammer-head west of the Taurus mountain range, was his first objective, and his first task was to shatter at the river Granicus (334) the great force brought against him by the satraps or governors of the western provinces. His victory there secured prompt submission, but the Persians still held the seas. The western ports had to be secured before, in the summer of 333, he was completely master of Asia Minor.

Then Darius gave him his opportunity by advancing with an enormous host and occupying on the banks of the river Issus a position in which the bulk of his troops could not be brought into action, Alexander having already pierced the mountain passes of Cilicia. On the Issus in 333 the Macedonians won an overwhelming victory; Darius and his army fled, the royal family and vast spoils falling into the conqueror's hands.

Alexander the Great. On a great sarcophagus found at Sidon, now in Istanbul, carved reliefs executed shortly after Alexander's death show, among other scenes, the king leading his troops to victory over the Persians. In the portion reproduced here, Alexander (left) wearing the lion's skin of Heracles, engages a Persian cavalryman

From Hamdy Bey et Reinach, "Une Necropole royale à Sidon"

Alexander refused to treat with Darius except on terms of the latter's complete submission. But he was not to be tempted into a mere military raid. He proceeded methodically to the subjugation of Syria and Phoenicia. The port of Tyre defied him and endured a siege of many months. But Alexander was now in possession of a fleet. By its aid, and by unprecedented feats of engineering skill, the resistance of Tyre was at last overthrown; the port was captured, the citadel stormed, and by the end of 332 Syria and Phoenicia were under Alexander's undisputed control. Egypt tendered its submission without waiting to be conquered. While in Egypt Alexander laid claim to the divine descent which was attributed to the Pharaohs, and was declared—doubtless with a political purpose—to be the son of the god Ammon. Also with masterly political insight he selected the site for the city of Alexandria, which was soon to become the centre of Greek commercial supremacy in the Mediterranean.

Flight and Death of Darius

He was now ready to complete his conquest. In 331 he advanced upon Babylon, descending the valley of the Tigris. Darius, despairing of compromise, had collected an army larger even than that which had been routed at the Issus. At the battle of Gaugamela or Arbela (Sept., 331) the triumph of the Issus was repeated. Again Darius fled into Media. The conqueror swept on to Babylon and thence to the eastern capitals Susa and Persepolis, the treasure-house of the Persian kings. Thence he moved upon the Median capital, Ecbatana. Darius, though once more at the head of a considerable array, did not dare to face him. As he retreated his army fell away; presently he found himself virtually a prisoner in the hands of a band of traitors. Alexander, hot in pursuit, overtook the fugitive force, himself at the head of only a small troop of horsemen. The traitors slew Darius and again fled east themselves.

When Darius was dead there was none to dispute the title with Alexander. At six-and-twenty he was lord of the whole world, so far as it was known to the Greeks, E. of the Adriatic Sea. Beyond the Persian Gulf and the Caspian Sea the lands and peoples that lay eastwards were mainly the subjects of fable. Alexander organized the empire he had won, neither after the fashion of an eastern conqueror, nor after that of

westerns, who simply impose their own institutions on subject populations. Everything was to be in the hands of the supreme ruler. The provinces were placed under governors controlling different departments of state, so that none could easily act as an independent prince; but in each province of Alexander's empire its religious and traditional institutions were respected and maintained. In Babylon or Susa Alexander was an Oriental, in Egypt he was the son of Ammon, and in Hellas he was the descendant of Achilles. East and West were brought under one empire, not that one might dominate the other, but that they might become fused in the natural course of development.

But the work of organization did not check the career of conquest. Alexander claimed sovereignty

Alexander the Great
The Louvre, Paris

over all the tribes dwelling E. as far as the mountain rampart of India and its N. extension, which separates Chinese from Russian Turkistan, and as far N. as the river Jaxartes or Syr Daria. Between 330 and 327 a series of campaigns compelled to submission all the barbarian princes, chiefs, and tribes of those wild and hitherto almost inaccessible regions. Incidentally, Alexander took to wife Roxana, a barbarian princess, to the displeasure of his Macedonian followers.

Still the conquest of the East was not complete. Eastern Turkistan was hardly likely to be worth the effort, but beyond the barrier south of it lay India. Enough of India was known, at least by the Persians, to attract Alexander's ambition. Already he had planted one of his many cities of Alexandria in the modern Afghanistan.

In the spring of 326 he led his army through the mountain passes, descended upon the Indus, and crossed over the river unopposed, entering the Punjab. Behind the Hydaspes (Jelum), however, one of the great Punjab princes, the bearer of a royal title rendered by the Greeks as Poros, had gathered a great force to resist the invader. Alexander, by an enveloping movement, carried across the river troops that turned the flanks of the native army, and it was routed. Poros himself was taken prisoner, having fought valiantly to the last; he won the conqueror's favour and was allowed to remain on his throne, though as Alexander's vassal and tributary. But beyond the Hyphasis (Sutlej), the farther boundary of the Punjab, even the loyal Macedonians refused to go. Alexander had reached the eastern limit of his empire.

Military Conquests and Commerce

But the men were ready enough to complete the conquest of the Punjab itself and the valley of the Indus. When that work was accomplished, Alexander dispatched an exploring expedition by sea along the coast from the mouth of the Indus to the Persian Gulf, with a view to commercial developments, which the genius of Alexander in no wise ignored, as he had already shown by the founding of the Egyptian Alexandria. It only remained to subdue Arabia, and then the empire, having as its southern boundary the coast from the Red Sea to the Indus, would have the whole Indian Ocean open to it. Alexander himself returned to Persepolis by way of Gedrosia, the modern Baluchistan. In 325, after the Oriental fashion, he took to wife Statira, the daughter of Darius, and he encouraged or compelled a number of similar unions between his Macedonian followers and noble ladies of the East. In this year and the next campaigning was suspended. Alexander was occupied partly in organization, partly in pageants and demonstrations intended to emphasise the might and majesty of the new empire. It can hardly be doubted that if he had lived but a few years longer he would have turned his face westward to seek farther conquests. But in 323 he projected the rounding off of his Asiatic dominion by the subjugation of Arabia. He was on the point of starting on that expedition when at Babylon he was stricken with fever. On the eleventh day—June 29—the mighty conqueror was dead.

Death at the age of thirty-two was a catastrophe for which no preparation had been made in Alexander's scheme of empire. The great fabric he had reared depended for its permanence on the continued control of a supreme genius; after a time the supreme genius would have become unnecessary, provided that the supreme authority was both universally recognized and capable. But no provision had been made for an adequate supreme authority to take the place of Alexander in case of his death. There was no heir to his sceptre except an infant, no minister of the great conqueror who could assume and exert an undisputed authority. The inevitable result of Alexander's premature death was the disintegration of the new empire, which in effect took the form of its division among the most powerful of his generals and lieutenants, who with their successors are commonly called the Diadochi.

It is not easy to realize the vast imaginative genius of the man who conceived the idea, not merely of leading victorious armies from one end to the other of the whole known world, like a Jenghiz Khan or a Tamerlane, but of fashioning the whole known world into a single vast community, homogeneous in one of its aspects, yet recognizing differentiations of race and of customs; an idea which has more nearly reached fulfilment in the British empire than in any other that the world has known, even including that of Rome. And in Alexander this imaginative genius was joined on the one side with the extremely practical statesmanship which made sound political organization attend immediately upon conquest, and on the other side with the strategical insight which patiently secured the whole eastern seaboard of the Mediterranean before it permitted an advance into the heart of Asia. And even beyond this we find Alexander giving the utmost effect to the tactical principles evolved by his greatest predecessors in the art of war and to the scientific conduct of siege operations almost without precedent. All this is obscured to most of us because our own imaginations are so much more impressed by certain of Alexander's picturesque aspects, his feats of personal daring, the traits of knightly chivalry or of human weakness and passion, which were so marked in his character, and the moral his life suggests concerning the vanity of human ambitions.

In the Middle Ages Alexander,

like many other heroes of antiquity, had acquired a highly mythical character, while his actual historical achievements were obscured. All manner of traditions and legends were transferred to him. The romance of Alexander, apparently first formulated in Egypt in the 2nd century A.D., popularised in a Greek version known as the work of the pseudo-Callisthenes, and latinised by Julius Valerius in the 3rd century, established itself as a predecessor of the Arthurian and Charlemagne legends. The most popular version is the 10th century work, *Historia de Preliis*, attributed to one Leo of Naples. There were versions in every European language—while the Persians and Arabs had their own variations on the exploits of "Iskander." The Alexander of the romance is the conqueror of Western Asia, of India, of Africa, and incidentally of the Amazons and of Italy and Britain. He was son, not of his putative father Philip, but of an Egyptian wizard, Nectanebus. Medieval magic, enchanters, dragons, and so forth, enter largely into the legend.

Alexander I (1777-1825). Tsar of Russia. Son of the tsar, Paul I, and a German princess, he was

Alexander I,
Tsar of Russia

born Dec. 23, 1777, and succeeded to the throne on his father's murder in 1801. He held liberal ideas, had a high sense of duty, and a conviction that monarchs were clothed with divine authority. Reversing his father's policy, Alexander made a convention with Great Britain, but sought also to act in concert with Napoleon, whom in reality he distrusted, and from whom he broke after the murder of the duc d'Enghien, 1804.

While Austrians and Russians were preparing for war Napoleon swooped down upon the Austrians at Ulm and shattered the combined armies, mainly Russian, at Austerlitz, Dec. 2, 1805. Next year, Oct. 14, Prussia was broken at Jena. Alexander gave an asylum to the Prussian king, but

after fighting two great battles at Eylau and Friedland he concluded in July, 1807, the treaty of Tilsit with Napoleon, in revenge for what he deemed the desertion of England and the futility of Austria. But he joined only half-heartedly in Napoleon's Continental System, directed against the admission of British goods into Europe. He saved Prussia from complete dismemberment by Napoleon, permitted rather than helped the overthrow of the Austrians at Wagram, July 5-6, 1809, turned a cold shoulder to Napoleon's proposals for marrying a Russian princess, and finally opened his ports to British commerce. War—Napoleon's disastrous Moscow adventure—followed in 1812. In 1813 Russia took a leading part in the uprising of Europe against the Napoleonic domination, which ended in 1814 with Napoleon's fall and his relegation to Elba.

Alexander now took the lead, supported by England, in securing liberal treatment for France and in organizing the Congress of Vienna for the settlement of Europe. The negotiations were interrupted by the Hundred Days, and after the final overthrow of Napoleon at Waterloo Alexander, with Wellington, resisted a vindictive policy towards France. But in the settlement of Europe Alexander's action was the curious product of two groups of ideas, which in existing conditions were wholly irreconcilable—his peculiar conception of autocracy and his sympathy with aspirations for liberty. By the latter he was moved to concede a constitution to his kingdom of Poland, while by the former he was led into creating the Holy Alliance.

This, however, reacted upon the tsar's domestic policy, destroying its old liberal character and making it repressive. So also in his later years, when Russians as well as British and French were watching with passionate sympathy the Greek struggle for independence, Alexander was found denouncing it as rebellion against legitimate authority. Yet to the last he cherished in his own mind the belief that he was a sincere champion of liberty. At the moment of his death, Dec. 1, 1825, a conspiracy had been formed against him which his brother, Nicholas I, had to suppress. See Holy Alliance; Vienna, Congress of.

Bibliography. Modern Europe, C. A. Fyfe, 1880-9; Revolutionary Europe, H. Morse Stephens, 1893; Modern Europe, W. Alison Phillips, 1901; History of Russia from the Birth of Peter the Great to the Death of Alexander II, W. R. Morfill, 1902.

Alexander II (1818-81). Tsar of Russia. Son of Nicholas I, he was born April 29, 1818, and

Alexander II,
Tsar of Russia

succeeded his father March 2, 1855. Nicholas had been, in the political sense, a most uncompromising reactionary. Alexander, on the other hand, was not without those generous impulses which had characterized his uncle, Alexander I. In spite of his measure for the emancipation of the Russian serfs in 1861, and his display of liberal sympathies in other ways, the despotic and arbitrary methods of Russian government remained fundamentally unchanged, and the revolt of Poland in 1863 was mercilessly crushed. In 1877, as in 1854, when the Powers refused to interfere on behalf of the Christian subjects in the Turkish empire, Russia intervened and the war which followed was ended by the treaty of San Stefano, which in its turn was set aside by the treaty of Berlin (1878).

The tsar's reign witnessed that expansion of Russia in Central Asia which was regarded by the British as a menace to the empire in India. During his later years there was a great development of the revolutionary or Nihilist party in Russia, generated by the merciless methods of the government. This led, after several attempts upon the tsar's life, to his murder on March 13, 1881, by a bomb flung beneath his carriage. *Consult Life, S. Graham, 1935.*

Alexander III (1845-94). Tsar of Russia. Younger son of Alexander II, and born March 10, 1845, Alexander became heir to the throne on the death of his brother Nicholas in 1865. His reign was marked by the repression of all liberal ideas, persecution of the Jews, and determined attempts to force the Russian language and Russian ideas on subject peoples. Alexander's life was often threatened by the Nihilists, but he died a natural death, Nov. 1, 1894.

Alexander I (c. 1078-1124). King of Scotland. Son of Malcolm Canmore and Margaret, an Anglo-Saxon princess, he passed some of his early years in England and became King of Scotland when his elder brother Edgar died 1107. During his reign the S. part of the kingdom was almost independent, being ruled by Alexander's young brother David, later David I.

Alexander was a great benefactor to the church. He died April 27, 1124.

Alexander II (1198-1249). King of Scotland. The son of William the Lion, whom he succeeded in 1214, he was lord of considerable estates in England and helped the barons to procure Magna Carta from King John. In 1216 he was at war with John, but after the latter's death he married his daughter Joan. He died on the island of Kerrera, July 8, 1249.

Alexander III (1241-86). King of Scotland. The son of Alexander II by his second wife Mary de Couci, he became king when eight years old. In 1251 he was married at York to Margaret, eldest daughter of Henry III of England. In 1263, by defeating Haakon V at Largs, he ended the Norwegian claim to the Hebrides. He was killed when his horse fell over a cliff near Kinghorn, Fife, March 12, 1286.

Alexander I (1876-1903). King of Serbia. The son of King Milan, who abdicated in 1889, he was proclaimed king under a regency, and assumed the kingship in 1893. In 1900, amid universal opposition, he married Draga Mashin, who had been one of his mother's ladies-in-waiting, and in March, 1903, arbitrarily suspended the constitution. A palace conspiracy was the result, and Alexander and his queen were assassinated June 11, 1903.

Alexander I (1857-93). Prince of Bulgaria. The second son of Prince Alexander of Hesse, he was born at Verona, April 5, 1857, and served in the Russo-Turkish war of 1877-78. At the instance of Alexander II of Russia, he was elected first prince of Bulgaria. April 29, 1879. He aroused Russian and Serbian opposition in 1885 by aiding the revolt in E. Rumelia and bringing about its union with Bulgaria. He defeated the Serbs in the field, but on Aug. 20, 1886, as the result of Russian intrigue, was compelled to abdicate, and was abducted to Russian territory. A counter-revolution ensured his quick return to Sofia, but finding Russian, Austrian, and German opposition too powerful, he formally resigned on Sept. 7. As Count Hartenau, he retired to Darmstadt and died at Graz, Styria, Nov. 17, 1893. *See Bulgaria, History.*

Alexander (1888-1934). First king of Yugoslavia. Born at Cetinje, Dec. 17, 1888, second son of King Peter of Serbia, he took the oath as heir apparent March

27, 1909, when his elder brother George renounced his right of succession. He distinguished himself in the wars of 1912-13 against Turkey and Bulgaria, and was nominally the commander-in-chief of the Serbian army in the First Great War. Proclaimed king of Yugoslavia Aug. 19, 1921, he married Princess Marie of Rumania, June 8, 1922. Racial and political dissension disturbed his reign, and in 1929, despairing of settling it in any other manner, he suspended the constitution and became in effect dictator. He was assassinated by a Croat terrorist while driving through Marseilles in company with Louis Barthou, the French foreign minister, on Oct. 9, 1934, and was succeeded by his son, Peter (*q.v.*).

Alexander, THE PAPHLAGONIAN (*fl.* 167). Greek impostor. He was born at Abonouteichos, in Paphlagonia, and studied medicine. Afterwards he gave out that he was a descendant of Perseus, and established himself as an oracle-monger. He is described by his contemporary Lucian in his *Alexander or Pseudomantis*.

Alexander, ALBERT V. (b. 1885). British politician. Born at Weston-super-Mare, May 1, 1885, son of an artisan engineer, he was educated at Barton Hill elementary school, Bristol, and at technical classes. He became a member of the staff of the Somerset county education committee, served in the army

A. V. Alexander,
British politician

during the First Great War, and was for many years a Baptist lay preacher. From 1922-31 he was Co-op. M.P. for the Hillsborough division of Sheffield, and again, as Labour M.P., from 1935. He was First Lord of the Admiralty in the Labour government of 1929-31 and in the first Churchill administration of 1940-45, and was reappointed to the same office in the Labour government formed in 1945. In Oct., 1946, he became minister without portfolio and in Dec. minister of defence. He was made C.H. in 1941.

Alexander, King of
Yugoslavia

Alexander, SIR GEORGE (1858-1918). British actor. The son of a Scottish manufacturer, he became a professional actor in 1879. In 1880 he joined Irving's Lyceum company, and during the greater part of the next eight years played under that great actor. In 1889 he took a theatre of his own, the Avenue, and two years later removed to the St. James's, where he

Sir G. Alexander,
British actor
Lillott & Fry

remained for the rest of his life. In 1911 he was knighted. He died at Chorley Wood, Herts, March 16, 1918. As an actor Alexander was best in fashionable modern comedy. The parts he made particularly his own were those of the well-dressed man about town, although he had a marked success as Rudolph Rassendyll in *The Prisoner of Zenda*. Among his most successful productions were *The Second Mrs. Tanqueray*, *His House in Order*, *Lady Windermere's Fan*, *The Importance of Being Earnest*, and *Old Heidelberg*. Consult Sir George Alexander and the St. James's Theatre, A. E. W. Mason, 1937.

F.-M. VISCOUNT ALEXANDER

Maj.-Gen. Sir Charles Gwynn, K.C.B., D.S.O.

This article reviews the career and achievements of a great British soldier. See also Burma Campaign; Dunkirk; Italy in the Second Great War; North Africa Campaigns; and biographies of Eisenhower and Montgomery

By common consent Harold Rupert Leofric George, first Viscount Alexander of Tunis, won a reputation unsurpassed by any general in the Second Great War. One must go back to Wellington and Marlborough to find his equal among British generals of the past. An Irishman, like many other famous British soldiers, third son of the 4th earl of Caledon of Castle Caledon, Co. Tyrone, he was born Dec. 10, 1891, educated at Harrow and Sandhurst, and commissioned in the Irish Guards, Sept., 1911.

Still a junior subaltern, he went to France with his regiment in 1914 and quickly made his mark as a leader of exceptional promise. Promotion came quickly, and during the last eighteen months of the war he commanded his battalion as an acting lieutenant-col. He was twice wounded, and five times mentioned in dispatches, with the D.S.O. and M.C., and a brilliant career clearly lay ahead. In 1919, specially employed with missions to Poland and Russia, for a year he commanded the Baltic Landswehr, thus gaining his first experience in command of foreign troops. Returning to England in 1922, he was promoted lieutenant-col. at the exceptionally early age of 31. Having completed his three years in command of his battalion, he then went as a student to the Staff College—a unique case—and although he graduated brilliantly, he asked at the end of his course to be employed on the staff in a lower grade than was due to his

rank, in order to gain experience of junior staff duties. This characteristic wish was met, but not until he had held a full colonel's appointment and had completed his military education at the Imperial Defence College, where selected officers of the three fighting services and some civil servants collaborate in the study of the concrete problems of combined staff work.

Having thus completed his military education, Alexander held staff appointments in England before going to India to command a brigade. There he gained experience of frontier mountain warfare, was awarded a C.S.I., and made contact with Indian native troops. Promoted major-general at the age of 46, he returned to England to command

the 1st division at Aldershot—the most coveted major-general's command in the army.

He took his division to France in 1939. That his powers of leadership inspired confidence was proved by his selection to take charge of the final stages of the evacuation from Dunkirk, May, 1940. His coolness and imperturbability did much to sustain the morale of the troops in the ordeal on the beaches, and to see their general in his moments of relaxation building sand castles calmed the nerves of men waiting for the next bomb or next boat.

Dunkirk was only the first of three "untidy" situations Alexander had to handle. The next was in Burma, whither he was rushed, now a general, in 1942 to become G.O.C. of an outnumbered and shattered army. His extrication of this force from an apparently hopeless position by a fighting retreat from Rangoon to the mountains of the Indian frontier was an outstanding achievement.

Hardly had the retreat from Burma ended when his appointment to be C.-in-C. Middle East called him to another untidy situation. Gen. Auchinleck, after the disaster in Libya, had halted Rommel's pursuit at Alamein, but it was a disorganized if not a demoralized army that stood to protect Alexandria. Mr. Churchill judged that new blood was needed not only to carry through the urgently needed reorganization but also to restore the confidence of the troops.

Great as was Montgomery's part in the battles of Alamein, in the long pursuit, and in the battles of the Mareth line and Akarit, it must be remembered that Alexander throughout was the responsible chief, and at Alamein was directly concerned in the planning and conduct of the battles.

Appointed after Alamein to be deputy to Gen. Eisenhower and to command the 18th army group composed of the 1st and 8th British armies, an American corps, and a French contingent, he became operational commander in Tunisia. His personal intervention to retrieve a dangerous situation when Rommel counter-attacked his American corps, and his brilliant and bold planning and conduct of the final battles in the spring of 1943, which inflicted humiliating and annihilating defeat on von Arnim, only confirmed his reputation as a masterly commander in action.

Alexander

For the capture of Sicily and the subsequent Italian landings his responsibility is not so clearly defined; as commander of the army group he took a great part, but Eisenhower was still in supreme command, and in amphibious operations it is difficult to apportion credit.

With the departure of Eisenhower to take charge of the main offensive in the west, Alexander was left solely responsible for the campaign in Italy, which had to be conducted under most adverse conditions of terrain and climate against some of the best troops commanded by one of the best generals Germany could produce. Furthermore, the advisability of collecting experienced allied troops and commanders for the great enterprise in Normandy inevitably necessitated transfers from the Italian theatre. It became not the least of Alexander's tasks to weld troops of many nationalities and of varying experience into an efficient army. How successfully he accomplished it was proved when he broke Kesselring's formidable Gustav position and captured Cassino. A bold transfer of formations from his right to reinforce his left and the skilful assignment of tasks to suit the characteristics of his troops of different nationalities contributed greatly to the victory. The capture of Rome, practically intact, resulted two days before D-day in Normandy, and brought its captor a field-marshal's baton.

Although Alexander drove the enemy from many strong positions and finally broke Kesselring's Gothic line, he was unable with his army, now further depleted, to achieve decisive victory before the winter of 1944. But with the spring he was able to synchronise his final blow with the main Allied offensive. Vittinghoff, Kesselring's successor, driven from his strongest positions, gave the Empire the satisfaction of seeing a British commander the first to enforce terms of unconditional surrender.

What were the attributes that brought Alexander his practically unbroken record of success? Undoubtedly he possessed to a high degree all the natural qualities of a soldier: physical and moral courage, a cool disposition, a capacity to arrive at quick decisions, and a tough physique. He had spared no pains to develop his natural qualities by as complete a military education as he could obtain. But in addition he displayed qualities of character

which, without apparent effort on his part, influenced the outlook and conduct of all associated with him. Full of quiet self-confidence, he had no need to assert himself or to seek the limelight. This, combined with charm of manner, enabled him to exercise authority with a minimum of friction and opposition. He thus was an ideal deputy for Eisenhower in the all-important task of establishing Allied military unity.

The announcement was made in July 1945, of Alexander's appointment as governor-general of Canada. He was created a viscount in the New Year honours list, 1946, and in May he arrived in Ottawa.

Alexander Nevsky (1220-63). Russian saint and warrior. Second son of Prince Yaroslav of Novgorod, he led the Russian forces against the Germans, Poles, Danes, and Swedes, and derived his surname from the defeat he inflicted on the Swedes on the Neva in 1240. He spent much of his life in seeking to improve the condition of the poor, who had been harassed by Tartar invasions, and after his death on Nov. 14, 1263, was canonised by the Orthodox Church. A great monastery and the order of S. Alexander Nevsky were founded in his honour by Peter the Great. A Soviet film depicting his victory over

Alexanders, celery-like wild flower

the Teutonic knights on Lake Peipus in 1242 was shown in Great Britain in 1942.

Alexanders (*Smyrniolum olusatrum*). Biennial herb of the family Umbelliferae. It was used as a potherb from ancient times until the more extended cultivation of celery, which has supplanted it. It is a native of the Mediterranean region, but is now wild in many parts of Europe, including Britain, especially near the coast. Its flavour resembles that of celery, but is much stronger and less pleasant. It bears numerous minute yellow flowers in round-topped umbels in the spring.

Alexander, SAMUEL (1859-1938). Australian-born British philosopher. Born at Sydney, New South Wales, Jan. 6, 1859, of Jewish parents, he was educated at Melbourne university and Balliol College, Oxford. From 1893 to 1923 he was professor of philo-

sophy at Victoria University, Manchester. He was awarded the O.M. in 1930, was a fellow of the British Academy, and was several times president of the Aristotelian Society. Space, Time, and Deity (2nd impression, 1927) is regarded as his masterpiece; other works include Spinoza and Time, 1921; Beauty and Other Forms of Value, 1933. He died unmarried at Withington, Manchester, Sept. 13, 1938.

Alexander Severus (205-235). Roman emperor from 222 to 235. The son of Julia Mamaea, he was adopted by a cousin, the emperor Elagabalus, and placed on the throne when Elagabalus was murdered. In 232 he defeated the Persian king, Artaxerxes, who had

Alexander Severus, Roman emperor

attempted to encroach upon the eastern boundaries of the empire. While on a campaign to repel a German invasion of Gaul, he was murdered by Maximinus, who succeeded him. Just and tolerant, Alexander Severus was distinguished for his love of learning and virtuous life.

Alexandra (1844-1925). Queen-consort, wife of King Edward VII of Great Britain and Ireland. Born at Copenhagen, Dec. 1, 1844, and baptized Alexandra Caroline Marie Charlotte Louise Julie, she was the eldest daughter of Prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, heir to the throne of Denmark. In 1863, the year of Alexandra's marriage, Christian became king of Denmark.

Albert Edward, prince of Wales, met Alexandra once or twice in Germany in 1861. He was her senior by three years. In 1862 Queen Victoria met the princess for the first time near Brussels. Shortly afterwards a formal proposal was made. On Sept. 9, 1862, the two were betrothed, and on March 10, 1863, they were married in S. George's Chapel, Windsor. They settled down at Marlborough House and Sandringham.

The princess of Wales gave birth to her first child, a son, Albert Victor, at Frogmore, on Jan. 8, 1864. Two sons and three daughters followed. At the end of 1871 the princess nursed her husband through his memorable

illness. The early years of Alexandra's married life had been taken up with domestic matters, but in 1868 she and the prince went abroad. After their return the princess began to take a more active part in the social life of the country of which she and her husband were, owing to Queen Victoria's secluded life, the leaders. Between 1871 and 1901 the princess of Wales fulfilled with remarkable success the duties of her high station. Her gracious manner and her real interest in the people made her popular everywhere.

In Jan., 1901, the prince succeeded to the throne, and Alexandra was crowned in Westminster Abbey as queen-consort by the archbishop of York, Aug. 9, 1902. As she had been as princess so she was as queen, and her charm and popularity remained unimpaired.

She did not often share the king's continental journeys, but she regularly visited Copenhagen, having always kept up the most friendly relations with her own kinsfolk; indeed, as her own home life showed, she possessed the domestic virtues to an unusual extent. In 1910 Edward VII died, and Alexandra, thereafter known officially as the queen-mother, returned to Marlborough House and received an annual income of £70,000. She died Nov. 20, 1925, and was buried beside King Edward in St. George's Chapel, Windsor. Over £230,000 was raised as a national memorial to her, and this was expended on the development of district nursing, the provision of pensions for queen's nurses, and the erection of

a statuary group in bronze outside Marlborough House. See Queen Alexandra, Sir G. Arthur, 1934.

Alexandra (1872-1918). Tsaritsa of Russia. Born June 6, 1872, she was the daughter of Louis IV, grand duke of Hesse, and a granddaughter of Queen Victoria. She changed her name from Alix to Alexandra Feodorovna at her marriage on Nov. 14, 1894. Her husband having become Tsar Nicholas II a few days previously. A powerful and determined character, she dominated her husband with her reactionary views, but was herself under the influence of Rasputin (*q.v.*) from 1907, being frequently in a state of exaltation in which she sought the guidance of Providence. She continually interfered in the choice of ministers until Rasputin was murdered at the end of 1916.

When the tsar abdicated on March 15, 1917, Alexandra went with him, and at Ekaterinburg (now Sverdlovsk), July 16, 1918, she was shot with him and their son and four daughters. Consult Letters of the Empress Alexandra Feodorovna to the Emperor Nicholas II, 1932; The Real Tsaritsa, by Lili Dehu, 1922.

Alexandra, of Kent (b. 1936). British princess, daughter of H.R.H. the duke of Kent (1902-1942) and Marina, duchess of Kent. Born on Christmas Day, 1936, the second child of her parents, her full names are Alexandra Helen Elizabeth Olga Christabel.

Alexandra Day, or ROSE DAY. Observed towards the end of every June, and named in honour of Queen Alexandra. It was first celebrated in 1912, the 50th year of Queen Alexandra's residence in England. Artificial roses, made by the blind and crippled, are sold in the streets, the profits being distributed among hospitals, convalescent homes, and kindred institutions. In 1944 the total raised was a record sum of £185,000.

Alexandra Palace. London place of amusement. Situated on a ridge in Alexandra Park, Muswell Hill, N. London, 6 m. from Charing Cross, it was opened May 1, 1875. It occupies about 7 acres. The Grand Hall, containing a fine organ, seats 12,000 persons and the orchestra 2,000, while the concert hall can accommodate 3,500 and the theatre 3,000. The palace, named after Queen Alexandra, is the second of its name. The first, opened May 24, 1873, was entirely gutted by fire on June

9 following. After being closed for some time the present structure and land were bought for £150,120 by the Middlesex and other county councils, and opened free to the public May 18, 1901. During the First Great War the palace was used for the internment of German prisoners, and since then the buildings had fallen into some neglect, until the B.B.C. opened television studios there in

Alexandra Palace. Aerial of television transmitter of 1939 on N.E. corner tower

1936. A television transmitter aerial 220 ft. high was added to the N.E. tower. The park, in which a racecourse is laid out, covers 480 acres.

Alexandretta. Seaport of Turkey, in the vilayet of Hatay. It is known also as Skanderoon, from its Turkish name of Iskanderun, and lies on the E shore of the gulf of Alexandretta at the extreme N.E. of the Mediterranean. The terminus of a branch line of the Adana-Aleppo Rly., it is about 70 m. N.W. of Aleppo. Anciently called Alexandria ad Issum, it was founded by Alexander the Great to commemorate his victory at the Issus, 333 B.C. Here Sir Kenelm Digby defeated a Franco-Venetian force in 1628 and Mehemet Ali won a victory over the Turks in 1832. In the First Great War it was occupied by British and French troops, Nov. 9, 1918. It is the port for Aleppo (*q.v.*), has a fair harbour, exports wool, leather, hides, nuts, silk, and copper in considerable quantities, and is a busy commercial centre. After the Turkish collapse in 1918 Alexandretta was included in the Syrian republic, and in 1937 became an autonomous sanjak, the name being officially changed to Hatay in 1938. But in 1939 the sanjak was formally returned to Turkey. Pop. 13,997. The Gulf of Alexandretta is a N.E. arm of the Mediterranean.

J. A. Todd, M.A., Author of The Banks of the Nile
In this article is the varied story of the city founded over two thousand years ago by the Macedonian conqueror after whom it was named. Further information is given under the headings
Abukir; Arabi, Ahmed; Egypt; Turkey, etc.

Alexandria. Plan of the modern seaport, which has more the character of a smaller Marseilles than that of an Oriental city

1. Mehemet Ali Square; at the far end is the Exchange.
2. Queen Nazli Avenue, with Obelisk Square on the left. 3. View of the port showing large mail steamers at the quays and one of the royal palaces on the left.
4. Minaret in the bazaar quarter. 5. Nebi Daniel

mosque. 6. Statue of Mehemet Ali (1769-1849), governor of the Sudan; beyond is Saad Zaghlul Square. 7. Air view showing, right, the modern western harbour, partly formed by a breakwater 2 miles in length; top left, the old eastern harbour

ALEXANDRIA: BLEND OF OLD AND NEW IN EGYPT'S GREAT MEDITERRANEAN PORT

the British bombardment of the town on July 11 of the same year. The sacking of the town by Arabs defeated followers in their flight laid a great part of the European quarter in ruins, and rendered necessary the rebuilding of the central area surrounding the Mehmet Ali Square. Since then the main features of the development of the city have been the extension of the harbour and the growth of large suburban quarters mainly occupied by Europeans. The city also forms the summer headquarters of the government, because its sea breezes render it more tolerable than the hot dry climate of the capital. The climate, however, is very dry for a sea-coast town, the rainfall being only about 8 ins. per annum.

The Native City

There is little of beauty or interest in the modern town. The native city is mostly crowded together on the site of the old Heptastadium, which, by the accumulation of centuries of silt and the characteristic Egyptian habit of throwing household refuse out of doors, has become about a mile wide. This promontory, known as Ras-et-Tin, separates the old eastern harbour, now only used by fishing boats, from the great modern or western one.

Alexandria is linked by rly. to Cairo and Suez, and by canal with the Nile; and the city is now the centre of the export and import trade of Egypt. The western harbour consists of an inner harbour of 464 acres and an outer harbour of 1,400, and is partly formed by a breakwater 2 m. long. The chief exports are raw cotton, grain, rice, and sugar.

In the Second Great War, Alexandria became the chief British naval base in the Middle East. In compliance with a treaty of 1936 whereby Britain retained an army of 10,000 troops and 400 aircraft in the zone of the Suez Canal, Egypt put the port at the disposal of the British Fleet. Before the collapse of France in 1940 a large part of French naval strength was also concentrated at Alexandria. On July 3, 1940, all French warships lying at Alexandria, consisting of a battleship, four cruisers, and some small ships, were demobilised by the British after peaceful negotiations with the French commander, Admiral Godefroy. The first of many Axis air raids on the city and port was made on June 22, 1940. That of June 7, 1941, did considerable damage, casualties amounting to

Alexandria. Pompey's Pillar, a great monolithic shaft in red granite on the site of the Serapeum

400. During the summer of 1942 the Axis threat eastwards from Libya directly menaced Alexandria and focused the attention of the world upon the city. Rommel's forces reached a line only 60 m. W. of Alexandria, and it was said that Mussolini was ready to ride into the city in triumph. The British victory of Alamein lifted the threat. All British forces had left Alexandria by Feb. 14, 1947. Pop. 925,081.

Alexandria. Town of Dumbartonshire, Scotland. On the Leven, 3 m. N. of Dumbarton by railway, its importance is due to cotton-printing, bleaching, and dye works. Pop. 10,359.

Alexandria. Town of Rumania, on the Wallachian Plain, in the department of Bucegi. It is the centre of a fertile wheat-growing district and is situated on the river Vedea, about 30 m. above its junction with the Danube, and some 50 m. S.W. of Bukarest. The town was founded by Prince Alexander John Cuza, after whom it was named. Pop. 19,387.

Alexandria. City of Louisiana, U.S.A., the capital of Rapides co. Standing on the Red River, about 193 m. N.W. of New Orleans by the Texas and Pacific Rly., it is a manufacturing centre, and trades in cotton and sugar. Here there was an Indian village, and the city, which obtained municipal rights in 1819, grew out of a trading station. It was named after Alexander Fulton, who was responsible for its settlement by whites in 1785. Pop. 27,066.

Alexandria. City and port of entry of Virginia, U.S.A. It is

100 m. from the mouth of the Potomac river and 7 m. S. of Washington. The city engages in chemical and other manufactures and has a good harbour, navigable by large vessels. An impressive landmark is the tall tower of the George Washington masonic memorial. Old Christ Church is an 18th century edifice in which George Washington worshipped. Pop. 33,523.

Alexandria, BATTLE OF. Fought between British and French, March 21, 1801. Napoleon's troops had seized Alexandria in 1798, and the British sent out a force under Sir Ralph Abercromby to check their further progress in Egypt. After landing, Abercromby fought two actions and was advancing towards the city when, on the narrow strip of land between Lake Abukir and the sea, he was met by the French under Menou. In the early morning the French attacked in column, but only in one place did they break through the British line, and their cavalry were hardly more successful. Beaten back and troubled by fire from British gunboats, the French yet drew off in good order. Out of 15,000 engaged the British lost about 1,500; out of 20,000 the French lost perhaps 3,000. Abercromby was mortally wounded and Sir John Moore injured. The Gloucestershire Regiment and the Black Watch won especial honour. The fight led to the surrender of Alexandria five months later. See Abercromby, Sir Ralph.

Alexandrian Library. After the death of Alexander the Great and the partition of his empire, Athens ceased to be the literary centre of Greek culture. Its place was taken by Alexandria, the meeting place of East and West, under the enlightened rule of the first Ptolemies—Soter, Philadelphus, and Euergetes. Mainly by the efforts and financial assistance of Philadelphus, two collections of papyrus-rolls, consisting of literary treasures from all parts of the known world, were made, one housed in the Bruchcion quarter in the royal palace containing 490,000 rolls or volumes, the other, in the temple of Serapis, 42,000. Many of these were different copies of the same work: for instance, there are said to have been 500 MSS. of Aristotle.

At the time of the conquest of the city by Julius Caesar (47 B.C.) much of the Serapeum collection, then reckoned to contain about 700,000 volumes, was accidentally destroyed by fire, and in

the reign of Theodosius the Great the temple itself was sacked by a mob of fanatic Christians urged on by Bishop Theophilus (A.D. 391).

Connected with the Brucheon library was the Museum, a kind of academy, where a number of learned men, whose duty it was to see to the arrangement, cataloguing, and general improvement of the MSS., were housed at the royal expense. The first librarian was Zenodotus of Ephesus (280 B.C.), the Homeric scholar, and Callimachus (c. 300–240 B.C.), the critic, grammarian, and poet, compiled the first catalogue. These and succeeding librarians drew up for the benefit of students the Alexandrian canon—lists of authors considered the best representative models of different classes of literature.

Alexandrine Verse.

Rhymed iambic hexameter verses with the caesura properly between the sixth and seventh syllables. First used in the French metrical romance of Alexander the Great, from which, or from one of whose authors, Alexandre de Bernay, its name is probably derived, it became the standard form of French heroic verse. In this, acatalectic couplets with masculine, or single, rhymes alternate with hypercatalectic couplets with feminine, or double, rhymes. Drayton's Polyolbion is written entirely in alexandrines, and the final line of the Spenserian stanza is an alexandrine. The most generally familiar instance of the verse is furnished by Pope's disapproving description of it as a needless line "That like a wounded snake drags its slow length along."

Alexandrite. Name of a dark green variety of chrysoberyl. It is found in the Ural Mountains and is prized as a gem-stone on account of the light transmitted in a certain direction being red.

Alexandropol. Russian city in the Armenian S.S.R., now known as Leninakan (q.v.).

Alexandrovsk or PORT CATHERINE. Russian seaport in Kola Bay, now known as Katerina Harbour (q.v.).

Alexandrovsk. Town of Ukraine S.S.R., now known as Zaporozhe (q.v.).

Alexandrovsk-Grushevsk. A town of Russia in the Azov-Black

Sea area. It is on the Rostov-Zyverevo Rly., 16 m. N.N.E. of Novo-Cherkask. The district is one of the most important coal-fields of Russia. Pop. 20,000.

Alexei Mihailovitch (1629–76). Tsar of Russia. Son of Tsar Michael, the first of the Romanovs, whom he succeeded in 1645, he was at war with Poland, 1654–67, and with Sweden, 1656–61. Smolensk and Kiev, with the territory E. of the Dnieper, were added to Russia by the Polish war. Of his fifteen children, Peter the Great, the son of his second wife, was the youngest but one.

Alexei Petrovitch (1690–1718). Eldest son of Peter the Great. A student from boyhood, of weak will and pious inclinations, he was entirely out of sympathy with his father's plans and activities, and in turn was despised and hated by Peter. In 1717 he fled to the emperor Charles VI at Vienna, and Charles sent him for safety to Naples. Persuaded to return by a promise of pardon, he reached Moscow Jan. 31, 1718. The names of the accomplices in his flight having been extorted, he was knouted June 19 and 24, dying in prison at St. Petersburg, June 26, 1718.

Alexei, eldest son of Peter the Great, from an engraving after Dinglinger's painting. From Brückner, Peter der Gross

Alexeiev, MICHAEL VASSILIEVITCH (1857–1918). Russian soldier. The son of a private soldier, he fought in the Russo-Turkish war of 1877–8, then entered a military academy, gradually rising in rank by sheer merit. He was quartermaster-general in Manchuria during the Russo-Japanese war, 1904–5, and became chief of staff to the Russian 3rd Army after the battle of Mukden.

At the beginning of the First Great War, Alexeiev was chief of staff to General Ivanov, who then commanded the Russian armies of the south-west. When in 1915 the tsar became commander-in-chief, Alexeiev became chief of staff and the real generalissimo. After the revolution of March, 1917, he was chief of staff to Korensky; but when Lenin and Trotsky came to power in Nov., he retired to the Kuban and helped to organize the volunteer army to fight the Bolsheviks. On Sept. 25, 1918, he died of pneumonia at Ekaterinodar (now Krasnodar), in N. Caucasias.

Alexius. Name of five East Roman emperors, 1081–1204, belonging to the Paphlagonian family of the Comneni. The only one of any importance was Alexius I. Another branch of the family supplied four emperors of Trebizond after the foundation of the Latin empire at Constantinople in 1204.

Alexius I Comnenus (1048–1118). East Roman emperor from 1081 to 1118. Elevated to the throne by a military revolution, he was confronted with serious dangers. In the west, the Normans landed in Epirus and besieged Dyrrachium. By valuable trading concessions Alexius secured the aid of Venice, and two naval victories put an end to Norman ambitions for a time. In the north, the marauding Petchenegs and the Turkish Kumans, who had crossed the Danube, were both defeated (1091 and 1094). In the east, the Seljuk Turks had founded a kingdom in Asia Minor.

Knowing the desire of Rome for a reconciliation with Constantinople, Alexius appealed to Pope Urban II for aid against the common enemy, Islam. The result was the first crusade and French victories over the Turks in Asia. Bohemund, leader of the Normans, set himself up at Antioch in 1098 as an independent ruler, and again attacked Epirus; but, overcome by Alexius's superior strategy, he was forced to sue for peace; and the defeat of the Seljuks in 1116 recovered the western half of Asia Minor for the empire. The end of Alexius's life was embittered by domestic quarrels as to the succession. A most capable ruler, by his military successes and skilful, if shifty, diplomacy, he postponed, but could not avert, the fall of the empire.

Aleyard or YARD of ALE. Old English drinking-glass, a yard or more long, holding about a pint.

It was usually trumpet-shaped, not unlike the horn carried by the guard of a coach. Sometimes it ended in a hollow ball; when the air reached the inside of the bulb the liquor spurted over the drinker. Drinking a yard of ale at one draught was a popular feat. The glass shown here is 38 ins. high and holds two pints.

Aleyard, British drinking-glass

Alfa OR HALFA Arabic name for esparto grass (*q.v.*).

Alfadir. One of the many names for Odin, the father of the Norse gods. See *Odin*.

Alfalfa (Arab. *al-fasfasah*, good food). Spanish name for a leguminous fodder plant. See *Lucerne*.

Alfarabi (c. 900-950). Arabian philosopher of Turkish descent. Born at Farab (Otrar) in Transoxiana, he studied at Bagdad, travelled in Syria and Egypt, and finally settled in Damascus, where he died. He was the tutor of Avicenna. Alfarabi was the first Oriental scholar to comment upon the logic of Aristotle, for whom he had an enthusiastic admiration.

Alfieri, Count Vittorio (1749-1803) Italian poet. Born at Asti, Piedmont, Jan. 17 1749, at the

Vittorio Alfieri

age of fourteen Alfieri became practically his own master, with ample means, and as a youth showed little inclination for serious studies. He entered the army, and for some years led a life of dissipation and intrigue, varied with travel in France, Spain, Holland, and England. At the age of 26 he turned to literature and wrote a play on the subject of Cleopatra. The reception of this at Turin fired him with ambition to write Italian poetry, and he applied himself with zeal to the study of the Tuscan dialect and to supplying in other ways the deficiencies of his education.

Alfieri wrote six comedies, twenty-one tragedies, an opera, an epic, some lyrical poems, and an autobiography. In 1777 he met at Florence the countess of Albany, wife of Prince Charles Edward, the Young Pretender, at that time a confirmed drunkard. She left her husband some years later, and the pope granting her a separa-

tion in 1784, she lived happily with Alfieri until his death on Oct. 8, 1803, at Florence. He was buried at the church of Santa Croce, Florence. The success of Alfieri's work was mainly due to his style, which was something entirely novel to the Italians, who had been accustomed to an artificial and sickly form of drama. *Consult Lives* by C. M. Charles, 1856, and E. Copping, 1857, and Alfieri's Autobiography, trans. C. E. Lester, 1845.

Alföld. Name of two regions of Hungary. The Little Alföld lies N.W. of Budapest towards Bratislava in Slovakia, into which country it extends. The Great Alföld covers the area E. of the Danube to the Bihar mts. on the Transylvanian border and enters Rumania, at a mean elevation of 250 ft. above sea level.

Sometimes referred to as the puszta or steppe, the Alföld is a typical treeless grassland—though the acacia has been cultivated to bind shifting sand—with many sandy hillocks and lagoons. It was formerly devoted to horse-breeding, but the pressure of food requirements forced the Magyars to till large areas for wheat, so creating one of the granaries of Central Europe. Covered in summer with wheat, maize, barley, and rye, the plains may be snowed over in winter. The chief river is the Theiss (Tisza), which roughly bisects the Great Alföld.

The chief cities of Hungary, except Budapest, stand on the Great Alföld: Szeged, its commercial capital; Debreczin, known as the Calvinist's Rome, noted also for cattle and horses; and Kecskeket; also Arad, now in Rumania, and Subotica, now in Yugoslavia. Smaller places show characteristics of garden cities, built round open spaces where fairs and markets may be held. The district around Debreczin is known as the plain of Hortobagy, through which runs the river of that name. The biggest town on the Little Alföld is Győr (Raab). See *Hungary*.

Alfold. Herdsmen of the plain standing by their shelter; one wears a richly embroidered sheepskin cloak

Alfonsine Tables. Astronomical tables prepared by order of Alphonso X the Wise, king of Castile, in 1252. They were tables of planetary motions, based on the Ptolemaic system of astronomy.

Alfonso. Name of 13 Spanish kings, also spelt Alphonso (*q.v.*).

Alford. Village of Aberdeenshire, Scotland, on the Don, 30 m. N.W. of Aberdeen. Here on July 2, 1645, the Royalists under Montrose defeated the Covenanters under Baillie. Montrose selected a defensive position behind a bog and was able to render useless the enemy's superiority in cavalry. The proportion of losses on the Covenanters' side was enormous, while the most prominent Royalist killed was Lord Gordon. Perhaps 2,000 men were engaged on each side.

Alford, Henry (1810-71). A British divine. Son of the Rev. Henry Alford, vicar of Ampton, near Bury St. Edmunds, he was born in London, Oct. 10, 1810, and educated at Trinity College, Cambridge. He was ordained in 1833, became fellow of Trinity in 1834, and then

Henry Alford
in succession vicar of Wymeswold, Leicestershire, minister of Quebec Chapel, Marylebone, and, in 1857, dean of Canterbury. He died Jan. 7. 1871. Apart from his annotated Greek

Testament, 1849-61, Alfred is best known as the author of *The Queen's English*, 1864, and as the writer of several hymns. He was the first editor of the *Contemporary Review*. *Consult* Life, Journals, Letters, ed. by his widow, 1873.

Alfred. A masculine Christian name very popular in England, largely because it was borne by Alfred the Great. Of Anglo-Saxon origin, it means wise in counsel. The almost obsolete *Alurcd* is a variant.

Alfred the Great (849-901). English king. A younger son of Ethelwulf, the successor of Egbert, king of Wessex, Kent, and Essex, and overlord of the other English kingdoms, and his first wife Osburga, he was born at Wantage, in Berkshire, and in childhood was taken by his father to Rome. According to Alfred himself and Bishop Asser, his friend, contemporary, and biographer, he could not read until he was twelve. Alfred's three elder brothers all reigned in succession after Ethelwulf, the third, Ethelred, becoming king in 866.

For thirty years past Danish marauders had periodically flung themselves upon the E. and S. of England. In 866 they descended upon East Anglia, and in 867 made themselves masters of Northumbria. In 868 they attacked Mercia, but Ethelred and his young brother led an army to

the help of the Mercians. Neither Danes nor English could win a decisive victory, but the Danes agreed to accept an indemnity or ransom and retire from Mercia. In 871 they invaded Wessex in

Wedmore with stricter definition and guarantees under the compact known as Guthrum's Fryth. Guthrum's own authority, however, only extended over Essex and East Anglia. In 892 a Danish host under the Viking Hasting descended upon Wessex. But Alfred had mastered all the devices which had given the Danish hosts their ascendancy. He built ships like those of the Danes, only bigger; taught his men to fortify and hold entrenched positions, trained them to keep the field instead of dispersing as soon as they had inflicted a defeat upon the enemy. The Danes were so soundly beaten that from 896 until his death on (probably) Oct. 28, 901, Alfred was molested no more.

Alfred's genius as a military organizer, even more than his brilliant leadership, rescued half England from Danish conquest,

Alfred the Great. The hull in this representation of Noah's Ark from the Caedmon MS., is typical of the warships of Alfred's day

By permission of the British Academy

force, and were defeated at Ashdown, mainly by the skill and valour of Alfred; but two months later the Danes more than held their own in another great fight at Merton. A few days after the battle of Merton, Ethelred died, and Alfred succeeded.

Until 875 Alfred was left in peace. He used the time in organizing the English for war and in laying the foundations of a fleet, while the Danes consolidated their dominion over East Anglia, Northumbria, and the north of Mercia. In 876 they invaded Wessex once more, and at the beginning of 878 Alfred, with only a few followers, was driven into retreat in the isle of Athelney, in Somersetshire, an episode in his career to which belongs the story of the burnt cakes. Yet in May the English forces had been again so reorganized that Alfred was able to lead them to a great victory at Ethandune. This was decisive. The Danes had learnt to respect their foe's courage and resource, and their chief Guthrum agreed to the compact known as the treaty of Chippenham or Wedmore (May, 878), and, with several followers, received baptism. Another Danish irruption in 884 resulted again in victory for Alfred and the renewal of the treaty of

and prepared the way for the recovery of English supremacy from the Channel to the Tyne. He was no less great as an administrator. He codified the varying laws and customs of his kingdom, modifying and coordinating them into the code known as the dooms of King Alfred. His dooms may be regarded as the real foundation of the common law of England, though he created nothing that had any resemblance to trial by jury, popularly attributed to him. He imbued his people with a new sense of unity, a national instead of a merely local spirit.

Hardly less remarkable were his efforts and achievements in the direction of education, though he did not, as tradition asserts, found the university of Oxford. He organized the teaching of the young, summoning foreign scholars to his aid. He translated from Latin into Anglo-Saxon the standard works of his time on philosophy and history, such as the *Consolations of Philosophy*, by Boetius (*q.v.*), the *History of Orosius*, and the *Ecclesiastical History of Bede*. He instituted and placed in competent hands that continuous contemporary survey of events, still used as a basis by all students of Anglo-Saxon language and history.

Penny struck to capture of London

Alfred the Great. Statue by Hamo Thornycroft at Winchester, where the king died in 901

commonly known as the Anglo-Saxon Chronicle. With fervent religious faith he loved the right, and he did the right. His people adored him while he lived, when he died they adored his memory. No one has ever uttered a word of adverse criticism against him.

Bibliography. Alfred the Great. T. Hughes repr. 1930. Life and Times of Alfred the Great. C. Plummer, 1900. Political History of England Vol. I. T. Hodgkin 1906. England before the Norman Conquest, C. W. C. Oman 1910. Alfred the Great, F. H. Hayward 1936.

Alfred Jewel. Enamelled gold oval jewel found near Athelney Abbey, Somersetshire, in 1693. Evincing indirect Byzantine influence, it bears a portrait presumably of the king surrounded by the words *Aelfred mec heht gewercean*, or Alfred had me wrought. It proves that skilled goldsmiths existed in Anglo-Saxon England.

Alfreton. Urban district and market town of Derbyshire, England. It is 14 m. from Derby, on the river, and the centre of a busy industrial district with potteries, stone quarries, collieries, ironworks, and hosiery manufacturing. The name is supposed to come from that of its founder Alfred the Great. Market day Fri. Pop. 21,232.

Alfriston. Village of Sussex, England, 7 m. NW. of Eastbourne across the South Downs. It is famous for a large 14th century church known as the

cathedral of the Downs (with a register dating from 1504), a rectory of the same period, secured by National Trust property, and a picturesque street containing the Star inn, one of the oldest in England with carved figures of saints. The Market Cross inn has associations with the lives of smugglers. The nearest railway station is at Berwick, about 3 m. to the N. of the village.

Alfuro. Term employed by the Malays for describing the uncultured non-Mahomedan peoples of Celebes, Ceram, and other islands in E. Malaysia. It is discarded by ethnologists because it represents no definite ethnic type. An Alfuro

—literally, outside—is usually of mixed Malay and negro blood, sometimes with a Caucasoid strain. Several dialects in Celebes and elsewhere are called Alfures.

Algae (Lat. seaweeds). A large group of plants, simple in structure but ranging in size from a single cell to large strap-shaped seaweeds some sixty yards long. Throughout the group there is very little differentiation of cells for special functions, with the exception of the reproductive organs. Reproduction in individual plants may be sexual, i.e. by the union of male and female elements to form a new individual, or asexual, in which one or few celled packets are

liberated by the parent to grow into new plants.

The algae form an unwieldy group, which is classified broadly speaking on the basis of colour. There are three main classes and some half dozen minor classes. The Rhodophyceae are the red forms, of which a few are found on British shores but most grow several fathoms below the surface of the sea. The Chlorophyceae are far more widespread, they are the grass-green algae, and are common in fresh water (the familiar blanket weed of stagnant ponds is an example) and also in salt water, e.g. sea lettuce. The green powdery 'dust' which grows on damp wood such as fences and tree trunks is a simple form which also belongs here. The Phaeophyceae, or brown seaweeds, comprise some of the largest species known. These all grow some distance out at sea, but smaller forms, such as the bladderwrack, are common on all parts of the British coast.

Before the Second Great War algae collected from the seashore and burned as kelp (q.v.) provided a potash fertiliser, some, such as Carrageen moss (*Chondrus crispus*) and laver (*Porphyra*), served as food. During the war a new industry developed in which calcium alginate was extracted from seaweed and used in surgical materials, textiles, and in paints and plastics. Two types of red algae (*Rhodophyceae*) provided a new source of agar-agar (q.v.) previously imported from Japan.

In geology, algae are fossil seaweeds, such as have largely helped in the building of certain lime stone rocks in Silurian, Devonian, Carboniferous, Jurassic, and Tertiary times, and of calcareous reefs around Pacific coral islands.

Alfred Jewel. Golden ornament found near Athelney Abbey Somerset, in 1693.
As in plate Museum Octo 1

1 Haldrys siliquosa with the finer growth of Polysiphonia or sea fir 2 Ascophyllum nodosum 3 Fucus serratus 4 Dictyota dichotoma 5 Plocamium coccineum 6 Gelidium latifolium 7 Chondrus crispus the carrageen or Irish moss which is used for making soup and also in the preparation of a kind of blancmange

ALGAE CHARACTERISTIC EXAMPLES OF VARIOUS KINDS OF SEAWEED

important to gravitational astronomy; the theory of invariants, which may be regarded as a study in algebraic form, and the theory of groups. Other "algebras" have been invented, with different fundamental laws (e.g. $xy = -yx$) logically deduced therefrom.

Algebra was invented by the later Greek mathematicians and developed by the Hindus and Arabs and in medieval Europe. There are many excellent textbooks; the most comprehensive work in English is *Treatise on Algebra*, G. Chrystal, 1886-9. See *Arithmetic*; *Calculus*; *Conic Sections*; *Equation*; *Mathematics*; *Trigonometry*.

Algeciras. Seaport and winter resort of S. Spain, in Cadiz province. It stands on the W. side of the bay of Algeciras, 6 m. W. of Gibraltar. The harbour is poor and used chiefly by fishermen. Oranges, charcoal, and leather are exported. Whale fisheries, operating off Algeciras, were started 1923 to 1925 with the help of Norwegian capital. The old town was founded by the Moors in 713; the modern town dates from the 18th century. In the bay, on July 6, 1801, Sir James Saumarez was defeated by a Franco-Spanish fleet, which, on July 12, he completely vanquished. Pop. 20,500.

Algeciras, CONVENTION OF. Agreement signed in 1906 regulating the affairs of Morocco. In 1904 Great Britain and Spain had agreed to allow France a free hand in Morocco. This Germany refused to recognize, contending that it was contrary to the Madrid convention of 1880, which gave equal rights to all the signatory powers. In March, 1905, the Kaiser visited Tangier, and the result of Germany's interference, then and later, was that the sultan of Morocco refused to agree to the reforms urged on him by France. He suggested a conference, which, after the resignation of Delcassé, France's foreign minister, met at Algeciras Jan. 16, 1906. Most of the European Powers and the U.S.A. were represented, Spain acting as host and president. Only Austria supported Germany, and on April 7 the convention, which admitted the privileged position of France, was signed. The reforms indicated were accepted by the sultan. These provided for the improvement of Morocco's administration, especially as regards finance and law and order, and regulated the trading rights of the various nations. See *Morocco*.

ALGERIA AND ITS CAPITAL ALGIERS

A description of the N. African territory that is now politically a part of Metropolitan France is followed by an account of its chief city, Algiers, giving its history from the 10th century to its day of political importance during the Second Great War

Algeria (Fr. *Algérie*) is not regarded as a colony, but is politically a portion of Metropolitan France, the Republic being represented by the governor-general in Algiers.

GEOGRAPHICAL FEATURES. Extending for 650 m. from E. to W., Algeria has an estimated area of 847,552 sq. m. Bounded on the W. by Morocco, on the E. by Tunisia, and indeterminately to the S. by the Sahara, Algeria is divided into two parts, Northern and Southern, the former consisting of three departments, Algiers, Oran and Constantine, and the latter of four territories, Ain Sefra, Ghardaïa,

the oases, such as Ghardaïa and Tougourt, in which French influence extends far to the south. North of the Tell, and on the border of the sea, are several separate groups of hills, such as the Sahel at Algiers. The Algerian rivers are short and are useless for navigation. They rise in the tablelands of the S. and cross the plain northward to the sea, forming winding, shallow watercourses, which in summer are little more than stony tracks. The Chelif or Shelif, 425 m. long, is the largest and most important. It rises in the N. declivity of the Jebel Amur, crosses the plateau in

Algeria, the land of the Mediterranean coast of Africa which was the last stronghold of piracy in European waters. It was, in 1830, taken over by France

Tuggurt or Tougourt, and the Saharan oases.

The Atlas Mts., running roughly parallel with the coast determine the configuration of the land. They consist of two series of chains, the Little, or Tell, Atlas to the N., and the Great, or Saharan, Atlas to the S., and form a broad belt of highlands, tablelands, and ravines. Their highest summit never attaining 8,000 ft., and separate the coastal region of undulating cultivated land known as the Tell from the desert region of the Algerian Sahara. This inland area sometimes called the high plateaux, includes the area of depression which contains the Shotts—saline, marshy, desolate tracts—and in the E. the area of the forested Jebel Aurès, which are high enough to be rainy and contain many very fertile valleys. The centres of population in the Saharan territories are at

a N.E. direction and turns W. to enter the Mediterranean through the Gulf of Arzeu. Next in size are the Seybouse, 145 m., and the Sahel, 100 m.

CLIMATE, FAUNA, AND FLORA. The climate is very hot in summer, but in spring is delightful, suggesting the fine, warm days of an English autumn or spring. There are occasional heavy rains, chiefly at night, but the rainfall is quickly absorbed by the porous ground, and the air is never damp. Algeria has therefore become a favourite residence for Europeans in the most congenial season.

Lions no longer exist, but leopards and panthers are occasionally met with, and jackals, hyaenas, wild boars, apes, antelope, red deer and wild goats are fairly common. Sheep, oxen, horses, mules, and camels are the chief domestic animals and among the

birds are eagles, hawks, vultures, ostriches, owls, and snipe.

The flora which comprises about 3,000 species is closely related to that of S. Europe. The trees of the forest-clad mountain districts include the cork oak, pine, cypress and cedar in the steppes grasses—principally alfa or esparto predominate, and in the Sahara the date palm is characteristic.

RESOURCES AND INDUSTRIES The country is rich in minerals. Of these, iron ore is the most important, being widely distributed and well worked. The output amounts to about two million metric tons annually. There is an important yield of antimony ore which is smelted at Pont de Vivaux, near Marseilles. Large quantities of phosphates are obtained at Constantine. The total output is not as great as that of Tunisia, but together these two French territories form one of the chief world sources of this important mineral. Small quantities of zinc ore are exported. There are cement factories near Algiers, Bougie, and Constantine. Good marbles and building stones are quarried.

Crops and Fruit

Agriculture, which provides employment for nearly three-fourths of the entire population, was greatly developed by the sinking of artesian wells, especially in the Sahara. About 8,000,000 acres are under cultivation for cereals, and produce chiefly wheat, barley, and oats. Alfa, or esparto grass, is gathered for export in very considerable quantities. Vegetables and fruit (oranges, figs, almonds, bananas, grapes, dates, etc.) are grown on an extensive scale, and tobacco is receiving increased attention with 57,899 acres under cultivation in 1938. Eucalyptus and acacia have been introduced with success. In the fertile coastal plains the vine has been much cultivated, and good wines are produced, which often, however, barely pay the grower. In 1937 the yield was over 339,000,000 gallons. The extraction of olive oil is a large industry, and experiments with cotton have been hopeful. The foreign commerce is principally with France.

There are over 3,000 m. of rivers, and 4,347 m. of national roads.

POPULATION The population is very mixed. Of the 7,234,684 inhabitants, the majority 6,247,432 are natives. The French number 853,209, and foreigners, 134,043. The French congregate chiefly in the towns, and, notwithstanding

great administrative efforts are not making Algeria a country of French people. The natives are Mahomedans, and consist of Arabs and Berbers. The Arabs are chiefly of nomadic habits, maintain the tribal form of society, make little or no advance in civilization, are very suspicious and have equal dislike and contempt for Western ideas and methods. They are indolent, courageous, and intensely religious.

The Berbers, of whom the Kabyles are the finest representatives, are very different in feature and in temperament from the Semitic nomads. They are of Hamitic origin, and doubtless include Greek, Latin, and northern blood infused during the vicissitudes of this long troubled country. The physical beauty of men and of women alike is often astonishing. Their complexion is fair to bronze and blue eyes and light hair are not uncommon. They are clever, industrious, quick to assimilate civilization, patriotic and devout.

GOVERNMENT Under the governor general there is a consultative council consisting of 15 members and a superior council consisting of 60 members. Three senators and ten deputies represent Algeria in the National Assembly in Paris. There is a prefect and council for each of the three departments of N. Algeria, consisting of French residents chosen by their fellows and natives nominated by the Minister of the Interior. In Algiers there is an excellent university, and there are Mahomedan colleges at Algiers, Tlemcen, and Constantine. The chief towns are Algiers, Oran, Constantine, Bona, Sidi bel Abbas, Tizi Ouzou, Philippeville, Mascara, Tlemcen, Mostaganem, and Bougie, all connected by railway.

Southern Algeria has been under a separate administration since Dec., 1902. Each territory is under a military command responsible to the governor general.

Military Service

French residents in Algeria before the Second Great War were liable for military service as in France. Natives had to serve 2 years and were then placed on the reserve. The military force of Algeria and Tunisia made up the 19th division of the French metropolitan army. There were 12 regiments of native tirailleurs and six regiments of Spahis, or Arab cavalry. There was also the Foreign Legion (*qv*) of four regiments, recruited from all nationalities, though mostly

officered by Frenchmen. At the time of the Allied landings in Algeria in Nov. 1942 the French military force there amounted to about 50,000 with five air force squadrons.

HISTORY Numerous evidences of the presence of man in prehistoric times abound, particularly cut flints, megalithic monuments, tumuli, and cromlechs. Near Kola is the tomb of Juba II, the Mauretanian king. The whole region is part of the Mauretania of the ancient Romans, whose sway after the destruction of Carthage, extended from the Red Sea to the Atlantic. The site of Carthage is near Tunis, where a Roman colony was powerful at the beginning of the Christian era. The Roman province of Africa increased in wealth, and presently the African Church became an important element in Christendom. In the 5th century Vandals from Spain swept through North Africa and they in turn, were driven forth by Belisarius. Put finally a Mahomedan invasion in the 7th century brought the whole of the region under the standard of the Crescent.

This was followed in the 11th century by a great immigration of Arabs, a lawless, nomad people, against whom certain coastal towns, of which Algiers was the chief, fortified themselves as independent powers. That city became the refuge of many Jews, driven from Europe in the 14th century, and later of many of the Moors expelled from Spain.

Modern Algeria

The long reign of piracy and lawlessness centred on Algiers led to the eventual annexation of the whole country by France. In 1830 a French army of 34,000 men seized and held the city and in Feb., 1842 Algeria became a part of France.

Throughout the rest of the 19th century insurrection gradually gave way to submission, and during the First Great War Algeria contributed largely to the fighting forces of Europe, not only from its European troops, but from the native tirailleurs and the Arab cavalry. Large numbers of German prisoners were transported from France and lodged in detention camps in and around Algiers.

After the capitulation of France to Germany in June 1940, Algeria came under the control of the Vichy government. Adm. Abrial, appointed governor general in Aug., 1940, was replaced by Gen. Weygand, the latter becoming

ALGERIA IN CITIES AND DESERT PLACES OF A FASCINATING LAND

Algiers. Contrasts of new and old : left, road leading down from the Boulevard de la République to the quays ; right, street in the high-level native quarter known as the Kasba, so named from the old castle which dominates it

to Vichy, withdrew his opposition and appeared willing to cooperate with the Allies, he was nominated in Giraud's place on Dec. 1. Darlan set up an imperial council at Algiers which included Giraud and representatives of the Fighting French ; but his appointment aroused strong criticism not only among the Fighting French, but in Allied political circles. On Dec. 24 he was assassinated in the Summer Palace at Algiers, where he had his office, Giraud being chosen by the imperial council as his successor, while Gen. Juin became C-in-C. of all French forces in North Africa.

Extreme political confusion prevailed for a time. But at the end of May, 1943, Gen. de Gaulle, leader of the Fighting French, met Giraud in Algiers for a series of discussions with a view to establishing a central French authority ; and on June 3 the French Committee of National Liberation came into being. The formation of a new French cabinet was announced on the same date, with Giraud and de Gaulle as joint presidents. Algiers thus became the birthplace of the "fourth French republic." French nationality was restored to some 140,000 Algerian Jews who had been deprived of it under the Vichy regime. The provisional consultative assembly met for the first time in Algiers on Nov. 3, 1943, with its chief aim expressed as the

direction of France's war effort and the upholding of that country's rights until the day when the liberated French nation could freely express its will by universal suffrage.

On April 8, 1944, Giraud was appointed inspector-general of the French army in place of his former position of commander-in-chief ; but he declined the appointment and was placed on the reserve. During the spring and early summer of 1944 various fascist supporters and collaborators were tried by military tribunal at Algiers. See also France in the Second Great War.

Algin AND ALGINIC ACID. Algin is a gelatin-like substance, obtained from seaweeds. It is the sodium salt of alginic acid and forms in water exceedingly viscous solutions. Algin is used as a size for paper and textiles and in the ice-cream, cosmetics, and pharmaceutical industries. Alginic acid is used as a stabiliser in the explosives industry and as a thickener in dyeing. See *Algae*.

Algoa Bay. Wide roadstead on the E. extremity of the coast of

South Africa. Port Elizabeth lies in the S.W. angle of the bay, which provides fairly well sheltered anchorage.

Algol (Arab. *al-ghul*, the demon). Remarkable double star which is charted as β Persci. It was called by the ancient astronomers The Demon Star because of the malevolence of its winking eye, a phenomenon of varying brightness now ascribed to the revolution of a dark star about a bright one. Algol gives its name to a small class of variable stars, called Algol variables, the cause of whose waxing and waning brightness can be explained with certainty. The stars are partially eclipsed by the dark companion revolving round them. During the greater part of the time the light of Algol is of the magnitude 2.1, but every 2 d. 20 h. 49 m. the star drops down to magnitude 3.2, and then immediately begins to brighten again, the whole change occupying 9 h. 20 m. See *Astronomy* ; *Stars*.

Algoma. District in the S. of Ontario, Canada. Occupying an area of over 71,378 sq. m., it extends from Lake Nipissing in the E. to the Lake of the Woods in the W. It is a rich mining region, where iron, copper, silver, nickel, platinum, etc., are found, and is served by the C.P.R. The town of Algoma lies on the N. channel of Lake Huron.

Algonkian. Systematic name applied to those pre-Cambrian rocks of North America which are of sedimentary origin, such as sandstones. The name is used in direct contradistinction to the pre-Cambrian rocks of igneous nature, such as gneisses, which are designated Archaean.

Algonquin. Tribe of N. American Indians. They give their name—meaning at-the-fish-spearing—

Algiers. Government Building in the Boulevard Foch, H.Q. of the French Administration for North Africa

place—to the Algonquian linguistic family, which once extended across the continent S of the Eskimos, and may be related to the taller Magdalenian race. The Vikings encountered them about A D 1000. The family numbers about 55,000 in Canada and 40,000 in the U S A.

Algorism. Term employed to denote the Arabic or decimal system of numeration. The numbers of algorism are the Arabic or Indian numerals. The word is corrupted from the territorial name of the Arab mathematician, Abu Ja'far Mohammed Ben Musa Al Khwarizmi, the translation of whose work on algebra made known the Arabic numerals in Europe.

Algraphy. Term describing lithographic printing using aluminium plates instead of litho stones. With zinc plates the term zincography is used. See Lithography.

Alguazil (Span *alguacil*; Arab. *al uazir*, the vizier). Name of a Spanish official. It is bestowed on those who are concerned with the administration of justice, namely the bailiffs and attendants at the courts. An alguazil major is an official having authority over the ordinary alguazils.

Al-Hakim (d 976). Caliph of Cordova. Son of Abd er Rahman III, whom he succeeded in 961, he was an able administrator and a patron of learning. He founded the great library of Cordova and enlarged the famous mosque, subsequently a cathedral.

Alhambra (Arabic *al*, the, *hamra*, red). A famous Moresco Spanish palace. It stands on a spur of the hills on which Granada is built, and overlooks the river Darro. The building was begun by Mahomed I (1232-72), the ruler of the kingdom of Granada, and completed during the reign of Yûsuf I (1333-54), to whom are attributed the Gate of Justice, the Wine Gate, and several of the interiors. The palace stands in a park of English elms—a present from the duke of Wellington, who, in return for an estate bestowed upon him by Ferdinand VII, had these trees sent out from England.

The Alhambra is both a palace and a fortress. The outside walls are of great thickness and strength. Beyond these barriers, however, one enters a fairyland of the most delicate architecture imaginable. The main entrance is the Gate of Justice, beneath the arch of which the kings of Granada listened to the petitions of their subjects. Over the outer arch is carved an open hand, and over the inner a key, and a Moorish legend had it that the Christians would never take the fortress until the outer

hand had grasped the inner key. The halls, chambers, and smaller courts of the palace are grouped about two great courts: the Court of the Lions and the Court of the Fishpond. The Court of the Lions is approached through the Hall of Justice, famous for the beautiful arched entrance to its central divan and for its paintings on leather in the domes of the alcoves, representing deeds of Moslems and Christians. To the right of the Court of the Lions is the Hall of the Two Sisters, its façade consisting of a typically Moorish arcade carried on slender twin columns. The stalactite ceilings of the Hall are among the finest examples of their curious kind. Corridors and alcoves surround the Hall, and on the upper floor are retiring chambers, through the lattice windows of which the ladies of the harem were permitted to view the fêtes below.

Massacre of the Abencerrages

Facing the entrance, on the opposite side of the Court of the Lions, is the Hall of the Abencerrages. The fountain in the centre is surrounded by marble pavement, the peculiarly dark veining of which is said to be connected with a tragedy involving the massacre of thirty six knights of the Abencerrages by the otherwise amiable monarch Boabdil. The Court of the Lions, so called from the twelve marble lions grouped round the fountain in the centre, measures 100 ft by 50 ft, and the pavilions surrounding it consist of 128 columns, single and in pairs and groups. The Court of the Fishpond, or of the Myrtles, has a length of 150 ft, the whole being filled by a marble bath. The architecture of this court reaches a height of Eastern delicacy and beauty attained nowhere else in Spain. At the far end is the narrow Hall of the Barque, and beyond that the magnificent Hall of Ambassadors, a square of 37 ft, roofed with a dome the centre of which is 60 ft from the ground. This is the largest of the halls of the Alhambra, and is renowned for the variety and splendour of its decoration. Below the floor is a network of dark passages. A curious cell with whispering holes at each end is said to have been built by Philip II to amuse his unhappy heir, Don Carlos. To the left of the Fishpond is the Mosque, approached through the Court of the Mosque, and on the right are the Baths.

The outstanding features of the palace, the needle-like columns, richly carved capitals and decorated arches, gorgeous mosaics, and

the tracery, boundless in its variety, of wall, ceilings and windows, do not deviate from the characteristics of Mahomedan architecture. What is distinctive is the stupendous scale on which these details were carried out.

Of the outer fortifications, many old towers are partly ruins. In the Watch Tower there still hangs a silver tongued bell capable on a still night of being heard 20 m or 30 m away. It was here that, on the fall of the city, the Christian flag was first hoisted by Cardinal Mendoza and his brother.

Round the Alhambra there are grouped various subsidiary buildings. The most important of these is the palace of Charles V, begun in 1526, but abandoned in 1635. The Generalife palace, some little distance away, was a summer pleasurehouse of the Moorish kings.

Alhambra Theatre. Former London house of entertainment, built and decorated in imitation of the Moorish style of the Alhambra, Granada. Opened 1854, on the E side of Leicester Square, as the Panopticon of Science and Art, a popular rival to the Polytechnic, it became a music hall in 1857. The original building was destroyed by fire in 1882, but the theatre was rebuilt the next year. Variety, musical play, revue, and ballet were regularly staged there. Among notable successes: The Bing Boys Are Here (1916) ran for 378 performances, The Bing Boys on Broadway (1918) for 562. Johnny Jones (1920) for 348, Waltzes from Vienna (1931) for 607, Tulip Time (1935) for 427. In 1936 the Alhambra was demolished, the Odeon cinema being erected on the site.

Ali (c 600-661). Fourth caliph. Son of Abu Talib and cousin of Mahomet, whose daughter Fatima he married. He succeeded Othman as caliph in 656. He was vigorously opposed by Mahomet's widow Ayesha, whom he captured near Basra at the battle of the Camel, so called because Ayesha was mounted on a camel. He was assassinated at his capital Kufa, and his shrine at Nejed, known as Meshed Ali, became a famous place of pilgrimage. His followers form the Shiite sect of Mahomedans. He acquired a posthumous reputation for learning, and the Sayings of Ali and some lyric poems known as The Divan are attributed to him. The Fatimite dynasty claimed descent from Fatima and Ali.

Alias. Latin word meaning otherwise. It is most generally employed for a name which is not the lawful one of the person using it. An alias may be quite legitimate,

This view of the Captive Tower from one of the windows of the Alhambra shows the richness of decoration which characterizes the Alhambra. The Captive Tower has been the prison of the Spanish monarchs Alphonse X and Sancho IV.

ALHAMBRA ORNATE PALACE OF THE MOORISH KINGS OF GRANADA

To face page 56.

1. General view of the Alhambra, with Granada on the right. 2. Court of the Myrtles and tower of the Hall of the Ambassadors. 3. Hall of the Two Sisters. 4. Garden of Lindaraja. 5. Gate of Justice. 6. Fountain in the Court of the Lions. 7. Tower of the Captive. 8. Rich decoration of an upper apartment. 9. Hall of Justice

ALHAMBRA: WITHOUT AND WITHIN THE WONDERFUL PALACE OF GRANADA

e.g. in the case of the pseudonym of a writer or actor. Its modern use is derived from a legal form formerly put down in indictments. To ensure the identity of a person charged with crime his indictment would run: Henry Jekyll alias Edward Hyde. *Pron.* Ai'-lee-ass.

Ali Baba. Hero of one of the tales in The Arabian Nights' Entertainments, that of Ali Baba and the Forty Thieves. Ali Baba is a poor man who happens upon the knowledge of a robbers' hoard and of the secret words, Open Sesame, which gain admittance to it. His brother Cassim finds out the secret and loses his life. The thieves seek to discover who has learnt their secret, and are successively killed in the attempt, thanks to the quick-wittedness and courage of Ali's slave Morgiana.

Ali Bey (1728-73). Mameluke sultan of Egypt. Born in Abkhasia, a region in the Caucasus, he became head of the Mamelukes (*q.v.*), and, taking advantage of the Porte's war with Russia, increased the number of the Mamelukes and reduced that of the janissaries. He assumed independent power about 1768 and, having subdued Syria and a large part of Arabia, was proclaimed sultan of Egypt by his cousin and nominee, the sheriff of Mecca. After a short reign he was defeated at Salahia by one of his sons-in-law who had revolted, and died of his wounds.

Alibi (Lat. *elsewhere*). A name given to a plea by an alleged criminal that he was somewhere else at the time. False alibis are very common, because nothing is more easy than for witnesses to be called to state that the prisoner was in their company at the time of the crime. They can give full details of everything that happened, and nothing is false but the date. Hence judges are very suspicious of this defence. The word is all too commonly used in the wrong sense, as a general synonym for "defence" or "excuse." *See* Evidence.

Alicante. Seaport and winter resort of Spain. Anciently known as Lucentum, it lies on the Mediterranean, is the capital of Alicante province, and has rly. communication with Madrid and Murcia. It enjoys an equable climate, has a modern cathedral and a good harbour, exports wine, fruit, esparto, and minerals, and manufactures cigars and textiles. Pop. 106,705.

Alicante. Maritime province of S.E. Spain. It is mountainous in N. and W., and is level and fertile elsewhere. Formed from parts of

the old provs. of Valencia and Murcia, it has an area of 2,185 sq. m. It has an equable climate, produces wine, sub-tropical fruits, and esparto grass, and the inhabitants engage in lead, iron, and copper mining. Pop. 630,770.

Alice. Town of Cape Province, S. Africa, on Tyumie river, 88 m. by rly. W.N.W. of East London. Near is the missionary station of Lovedale. Pop. 1,500.

Alice. Feminine Christian name. The word comes from the Anglo-Saxon *adel* or *ethel*, meaning noble. First it took the form of *Adelicia*, meaning noble cheer, then of *Alicia*, and later of *Alice*.

Alice (1843-78). Grand-duchess of Hesse-Darmstadt, and the second daughter of Queen Victoria. She was born at Buckingham Palace, April 25, 1843, and was named Alice Maud Mary. In 1862 she married Prince Louis of Hesse. She founded the Women's Union for Nursing the Sick and Wounded in War. She died Dec. 14, 1878, of diphtheria, caught in nursing her husband and children.

Alice's Adventures in Wonderland. A fantastic tale for children, written by Lewis Carroll (C. L. Dodgson). First published in 1865, it originated in a story which the author improvised for

What Alice Found There. These books, in their combination of lively extravaganza, parody and burlesque, and inverted logic, struck a new note in nursery fiction. The sequence of clearly defined, if extravagant, characters, *e.g.* the Mad Hatter, the Cheshire Cat, the Duchess, the White Knight, have made the books lasting favourites with both children and adults.

Alice Sit By The Fire. Satirical comedy by J. M. Barrie. It was first produced, April 5, 1905, at The Duke of York's Theatre, London, and ran for 115 performances.

Alice Springs. Seat of the administration of Northern Territory, Australia. It is situated 1,120 m. N.W. of Adelaide, on the transcontinental telegraph wire to Darwin, and is the terminus of the Central Australia railway from Adelaide. A road built during the Second Great War as a strategic link joins Alice Springs with Birdum, terminus of the North Australia railway (316 m. to Darwin). The town lies in a stock-rearing and mining country.

Alien (Lat. *alienus*, foreign). Person who does not belong to the country in which he lives, *i.e.* from the point of view of Great Britain, any person who is not a British subject. A person who is a

Alice at the Mad Hatter's tea-party, together with the March Hare and the Dormouse, a fine example of Sir John Tenniel's spirited illustrations to Lewis Carroll's famous story of *Alice's Adventures in Wonderland*

By permission of Messrs. Macmillan & Co., Ltd.

some child friends, notably Alice Liddell, daughter of the dean of Christ Church, Oxford, and then wrote down for them. Illustrated by Sir John Tenniel, it enjoyed wide popularity, being followed in 1871 by a scarcely less attractive sequel, *Through the Looking-Glass* and

subject of a foreign state is not necessarily an alien here. Each state has its own laws as to who are its subjects and the laws of two states may overlap so that one person may have two nationalities. Thus, if a foreign woman married to a foreigner gives birth to a child

while staying, it may be for only a few weeks, in Great Britain. The child will certainly be born a British subject by English law (since all persons born in the British dominions are British subjects) and will also probably be a subject of the country to which his father belongs, by the law of that country. Thus in neither country is he born an "alien." When he becomes 21 he may make a declaration of allegiance giving up his British nationality.

Until 1870 aliens could not own freehold property in England, nor even leasehold property for more than 21 years, nor could they own any British ship. But by the Naturalisation Act, 1870, aliens were allowed to hold every kind of property except a British ship.

The main other disqualifications of an alien in peace time are that he is not qualified to serve on a jury (except, after 10 years' domicile, on an inquest); has no vote; cannot be a member of either house of Parliament; cannot hold any office of trust, or (apart from a temporary relaxation during the Second Great War) any office in the civil service. No alien can change his name (except, of course, in the case of a woman on marriage) without permission from the Home Secretary. If he is a director of a company, his nationality must appear on the company's notepaper. Even when he has been naturalised, his nationality of origin must appear.

The entry of aliens is controlled by the Home Secretary. No alien can enter except at certain approved ports and with the leave of an immigration officer. He must have a passport and satisfy certain conditions relating mainly to his character, health, and ability to support himself. When he has entered the country he must register with the police and keep them informed of any change of address.

During the Second Great War much more severe restrictions were imposed on aliens and particularly on enemy aliens—that is, subjects of any state at war with this country. Aliens, whatever their nationality, were forbidden to possess any firearms or ammunition, or even a bicycle, and had to observe a "curfew." Enemy aliens were for the most part interned. If not interned, their liberty might be severely restricted, e.g. they were generally prohibited from possessing a radio set.

An enemy alien could not sue in British courts, but might be sued, and, if sued, had a right to defend the proceedings. Enemy aliens residing in the United Kingdom with the permission of the Crown were, however, allowed to sue. British subjects who voluntarily resided in an enemy country were regarded as enemy aliens.

At Common Law trading with alien enemies is illegal, but during both the First and the Second Great Wars special Trading with the Enemy Acts were passed. The Act of 1939 made it illegal for anyone to have any "commercial, financial, or other intercourse or dealings with or for the benefit of the enemy." Custodians for enemy property appointed by the board of trade received any sums due to an enemy.

An alien may become a British subject by naturalisation or by being an inhabitant of territory ceded to the U.K. Under the British Nationality Act, 1948, an alien woman marrying a British subject, formerly automatically British, had to apply for naturalisation. See British Subject; Naturalisation.

Alienation. English legal term meaning the transfer of the ownership of property.

Alienism. Term in pathology meaning the study and treatment of mental disorder (*q.v.*).

Alif. First letter of the Arabic alphabet. Used as a symbol for Allah, the Mahomedan name for the Deity, it is often set at the head of Arabic documents.

Aligarh. District and fortified town of India. The district, the southernmost in the Meerut division of the United Provinces, has an area of 1,946 sq. m. The

town, situated 55 m. N. of Agra on the E. Indian Rly., with the adjoining native city of Koil, forms for administrative purposes a single municipality. The fort, which gives its name to the place, was captured from the Mahrattas by Lord Lake in 1803. The former Aligarh College, founded by Sir Syed Ahmad in 1875, a famous Mahomedan centre of learning, was reconstituted in 1920 as the Muslim University. The town trades in cotton, grain, and indigo. Forty per cent of the population of the town are Mahomedans, although the district contains only 14 p.c. Pop. of town, 112,655.

Alignment or **ALINEMENT** (Fr. *à ligne*, to line; Lat. *ad*, to, *linea*, line). A technical term employed in drawing, engineering, military parlance, and surveying to indicate the laying out or adjusting of any units in a line, or the state of being in line. In drawing, a plan view may be referred to as the alignment of the subject; in engineering, units of machinery are said to be in alignment when the centres of the shafts or axles are in the same straight line; and in surveying the term is used in both these senses. In gunnery and musketry the term indicates the placing of the sights into such line with the target as will result in the latter being hit when the weapon is fired. See Artillery.

Alima. River of French Equatorial Africa. Rising near Ogowe Springs, it flows E. and S.E. to the Congo some 250 m. N. of Brazzaville. Discovered by De Brazza in 1878, its length is 400 m., about 200 m. being navigable.

Alimentary Canal (Lat. *alimentum*, food). Anatomical term for the channel leading from the mouth to the anus, along which the food passes in the process of digestion. It is composed of the oesophagus or gullet; the stomach; the small intestine, which is divided into the duodenum, about 9 ins. long, and the jejunum and ileum, together about 23 ft. long; the large intestine, about 6 ft. in length; and the rectum.

Alimony (Lat. *alere*, to nourish). Legal term used for an allowance in money paid by husband or wife, generally the former, to a spouse from whom he or she is separated. Where the marriage is dissolved, the guilty party may be ordered to pay a sum to the other for maintenance; but this is not alimony, though it is often called so. While divorce proceedings are

Alimentary canal in section, showing a few of the convolutions of the 23 ft. of the small intestine

pending, the court usually orders alimony to be paid by the husband to the wife, generally at the rate of one-fifth of the husband's income. After a decree of judicial separation, the court usually orders the husband to pay such a sum as will make up his wife's income to one-third of their joint income. Thus, the wife has £100 a year of her own; the husband has £500 a year. £100 + £500 = £600. The wife is entitled to one-third; so the husband is ordered to pay £100 a year to bring her income to this figure.

In Scots law the term *aliment* is used in this connexion, although not quite with the same meaning. *Aliment* refers to allowances made not only to husband or wife, but to children, grandchildren, parents, and even to grandparents. The maintenance of these, if their age and condition demand it, is a legal obligation, and if neglected can be enforced by legal action.

Aline. Sea-loch of Argyllshire, Scotland. Forming an arm of the Sound of Mull, it is 2½ m. long and ½ mile wide. Near are the ruins of Kinlochaline Castle.

Alington, CYRIL ARGENTINE (b. 1872). British divine, schoolmaster, and writer. The son of a Lincolnshire clergyman, he was educated at Marlborough and Trinity College, Oxford, and became a Fellow of All Souls in 1895. After holding masterships at Marlborough and Eton, he took holy orders and was appointed headmaster of Shrewsbury in 1908. In 1916 he succeeded Dr. Edward Lyttelton as headmaster of Eton, and in 1933 was appointed dean of Durham. His writings include detective fiction and volumes of popular religious exposition.

Ali Pasha (1741-1822). Albanian ruler, known as the Lion of Janina. An able and just ruler within his own dominions, Ali Pasha was unscrupulous and merciless in his dealings with enemies or doubtful allies. As a Turkish vassal, he was appointed pasha of Trikala in Thessaly for his services in the war of 1787, and in 1788 became pasha of Janina. During the Napoleonic wars he took the side of the French and the British alternately, with a view to securing a firm foothold on the Adriatic. This he appeared to have accomplished when Parga in Albania was granted to him by the British, but in 1822 he was defeated and put to death by order of the sultan, Mahmud II. Byron, who met him, refers to him in *Childe Harold*. He is the central figure in Maurus Jokai's novel, *The Lion of Janina*.

Alipore. Southern suburb of Calcutta, India. It contains public offices, Belvedere House, the residence of the lieutenant-governor of Bengal, a large gaol, and cantonments for native troops. Here are also the Zoological Gardens and the Horticultural Society's Gardens.

Alismaceae. Large family of flowering plants, more or less aquatic in habit. They are perennial herbs, with erect or floating leaves produced directly from the rootstock, which is often fleshy. The flower parts are in threes or multiples of three. The species, of which there are about 50, are of no economic importance; they are represented in most climates. Familiar genera are water plantain (*Alisma*), arrow-head (*Sagittaria*), and flowering rush (*Butomus*).

Alison, SIR ARCHIBALD, BART. (1792-1867). British historian. Eldest son of the Rev Archibald Alison (1757-1839), who was author of *Essays on the Nature and Principles of Taste*, he was born at Kenley, Shropshire. He studied at Edinburgh University, became an advocate, and in 1834 was made sheriff of Lanarkshire. In 1832-3 he published *Principles of the Criminal Law of Scotland*, long a standard work; in 1833-42 the *History of Europe from 1789 to 1815*, and in 1852-9 *Europe from Waterloo to the Accession of Louis Napoleon*. Alison was made a baronet in 1852, and died May 23, 1867.

Sir A. Alison,
British historian

Alison, SIR ARCHIBALD, BART. (1826-1907). British soldier. Eldest son of the historian, Sir Archibald Alison, he was born at Edinburgh. He entered the Seaforth Highlanders in 1846 and fought in the Crimean War and also the Indian Mutiny, losing his left arm at the siege of Lucknow. After holding commands at home, he served in the Ashanti War of 1873-4, led the Highland Brigade at Tel-el-Kebir, and, gazetted general 1888, succeeded Wolseley as commander-in-chief in Egypt. For five years he held the Aldershot command. He died Feb. 5, 1907.

Sir A. Alison,
British soldier

Aliwal. Village of E. Punjab, India. It is on the Sutlej, 9 m. W. of Ludhiana, and was the scene of a battle fought Jan. 28, 1846, between the British and the Sikhs. The latter had moved a big force to seize Ludhiana and so break the British communications with India. To check this Sir Hugh Gough, the British commander, detached Sir Harry Smith, who, with 12,000 men, freed Ludhiana and crushed the Sikh army at Aliwal, thus giving the territory E. of the Sutlej to the British.

Aliwal North. A town and district of Cape Province, S. Africa. The town, on the Orange river, 280 m. by rly. and about 170 m. direct N.N.W. of East London, was captured from the Boers on March 11, 1900. The Aliwal sulphur springs are near the town. The district, bounded N. by the Orange river and W. by the Stormberg Mts., has an area of 809 sq. m. Pop. district, 15,838; town, 7,647.

Aliwal South. Old name of the S. African port Mossel Bay (*q.v.*).

Alizarin (Arab. *al*, the; *asarah*, plant-juice). The chief colouring matter contained in madder, *Rubia tinctoria*, a dye used for the colour known as Turkey-red. Alizarin was first isolated from madder by Colin and Robiquet in 1826, and its chemical composition established by Schunck of Manchester.

Perkin, the discoverer of the first aniline dye, turned his attention to the artificial production of alizarin, and in 1868 prepared it commercially from anthracene. He succeeded and made England the birthplace of the manufacture of artificial alizarin. The manufacture is now successfully carried on by the British Alizarin Company, founded by the Turkey-red Dyers' Association. Most commercial alizarin is made from anthraquinone (*q.v.*). The fabrics to be dyed with alizarin are first mordanted, various mordants being employed. With an alum mordant, red and pink shades result; with iron, shades of black and purple; and with tin crystals, a bright yellowish orange.

Aljubarrota. Village of Portugal, in Leiria district, 63 m. N.N.E. of Lisbon, where on Aug. 14, 1385, King John of Portugal gained the independence of his country from Castile.

Alk. A fragrant gum-resin obtained from the terebinth tree (*Pistacia terebinthus*) by incising the bark.

Alkahest or ALCAHEST. Fifth or unknown element, sought as a universal solvent by the early

alchemists. The term was coined, possibly by Paracelsus, to imitate an Arabic word. *See* Alchemy.

Alkali. A native judge who acts under the warrant of the governor of Nigeria.

Alkali (Arab. *al*, the; *qali*, ashes of salt-wort). This rather vague word was used to denote the hydroxides of lithium, sodium, and potassium, the oxides of these three elements and of calcium, strontium, and barium, and also ammonium carbonate and the carbonates of lithium, sodium, and potassium. The most important of all these are sodium hydroxide (caustic soda), sodium carbonate (soda), and potassium carbonate (potash). Potash was in early days obtained from the ashes of burnt vegetable matter (land plants); soda was obtained partly from the ashes of seaweeds, kelp, and partly from natural deposits of trona, the sesquicarbonate, $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$, found in Egypt and in some other localities. In 1775 the French Royal Academy of Science offered a prize for the best method of obtaining sodium carbonate from common salt. The prize should have been awarded to Nicholas Leblanc, who in 1790 started the manufacture of soda at S. Denis by a process of his own invention, but it was not awarded and in 1792 Leblanc's patents and his works were confiscated by the French government. Leblanc was reduced to poverty and committed suicide in 1806. This process was introduced into England by Losh in 1796, and was developed on a

larger scale by Muspratt in 1823 and by other manufacturers here who made use of the various by-products formed in the process, until the alkali industry included the manufacture of many of the compounds of sodium and potassium that were of commercial importance.

The Leblanc process used common salt, NaCl , limestone, CaCO_3 , and coal (impure carbon) as its raw materials. The first step was to treat the salt with sulphuric acid so as to make sodium hydrogen sulphate and hydrochloric acid; the sodium hydrogen sulphate was heated with limestone and coal to make sodium carbonate and calcium sulphide; the hydrochloric acid was collected and used for making bleaching powder and other substances, and the calcium sulphide was originally thrown away, but in later years the sulphur in it was converted into sulphuric acid and used for a variety of chemical operations. The sodium carbonate was used as washing soda, and in the manufacture of glass and soap, and the industry attained great importance. The Leblanc process for making soda flourished on a very large scale in Great Britain for a period of about seventy years; it depended for its success partly on the recovery and use of the by-products made in the process, one of the most important being chlorine. Weldon in 1869 and 1870 effected a notable saving in this recovery; the price of bleaching powder was reduced by £6 a ton; its production was

quadrupled, and something like £750,000 per annum was added to the national wealth. The French chemist Dumas said that by Weldon's invention every sheet of paper and every yard of calico had been cheapened throughout the world. In spite of its success the Leblanc process was driven out of existence by a better one, the Solvay process.

This process, known as the ammonia soda process, was started by Ernest Solvay and his brother in Belgium in 1865 and after a long struggle drove the Leblanc process out of existence. The Solvay process consists in saturating a solution of sodium chloride (brine) with ammonia and carbon dioxide in accordance with the following equations:—

The NaHCO_3 , sodium bicarbonate, so formed is heated to produce the normal carbonate, carbon dioxide, and steam, the action being as follows:—

In the year 1873 the Solvay firm granted to John Brunner and Ludwig Mond a licence to use this process in Great Britain, and the two started a works in Cheshire. Gradually, largely owing to Mond's determination and chemical knowledge, they overcame the considerable difficulties of the process and greatly improved it so that it became more economical than the Leblanc process. The raw materials of the Solvay process are lime, carbon dioxide, and ammonia. The carbon dioxide is obtained by heating limestone in kilns, and the quicklime so made is used in the process for the recovery of ammonia. A strong solution of brine is saturated with ammonia and the solution falls down a tower fitted with baffle plates and meets an ascending current of CO_2 ; the sodium bicarbonate, not being very soluble, crystallises out. The sodium bicarbonate is converted into the normal carbonate by heating it in open pans; the anhydrous sodium carbonate is called soda ash; if this is dissolved in water and allowed to crystallise, crystals of the decahydrate, $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$, are formed. This compound is called washing soda; from it the crystal carbonate, $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ can be prepared by slow evaporation. Another sodium carbonate is known as concen-

Alkali. One of several great plants devoted to the production of alkalis and the numerous chemical processes connected with their use
Photo, courtesy of Imperial Chemical Industries

trated soda crystals; it has the formula $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$, and is prepared by crystallisation from a solution containing equimolecular quantities of the two carbonates.

sodium; the chlorine is drawn away and either liquefied or used for making hydrochloric acid, or bleaching powder, or some other compound of chlorine. The sodium dissolves in the mercury

The damage caused to vegetation in the neighbourhood of the works led to legislative action being taken to compel alkali makers to condense the acid gases.

The result was the first Alkali Act, 1863, which limited the amount of hydrochloric acid gas allowed to be evolved. Its scope was extended in 1874 to include other noxious gases. These Acts were further extended and consolidated in 1881. Another Act, in 1892, added to the list. The Alkali, etc., Works Regulation Act, 1906, consolidated previous Acts, but war-time powers to override in certain circumstances were given by the Defence Regulations, 1939.

Alkaline OR ALKALI ROCKS.

Class of igneous rocks containing a relatively high percentage of soda and potash and thus characterised by a special mineral composition. They contain such minerals as nepheline, melilite, hauyne, sodalite, analcite, leucite, soda-pyroxenes and soda-amphiboles, orthoclase and anorthoclase. They are often restricted in their occurrence to certain definite areas or petrographical provinces, *e.g.* to that portion of N. and S. America E. of the Rocky Mts. and of the Andes. Some of the most important alkaline rocks are the nepheline-syenites, phonolites, and leucite-basanites.

Alkaline Earths. Term given by the old chemists to certain earthy minerals which they found to be insoluble in water, resistant to heat up to very high temperatures, and generally similar in their properties to alkalis. These substances were carbonates, sulphates, or oxides of the metals beryllium, barium, calcium, magnesium, and strontium, none of which metals is ever found native, and were supposed to be elements until proved compounds by Davy.

Alkaloids. Class of nitrogenous organic compounds possessing basic properties. They are found in plants and animals, the vegetable alkaloids used in medicine being the more important. The names used for alkaloids are made to end in "ine," while glycosides, which also occur in plants but contain no nitrogen, have names that end in "in."

Alkaloids are extracted from plants by grinding the plants to fine powder, moistening with 95 p.c. of alcohol, sometimes acidified with hydrochloric acid or mixed with lime, allowing the mass to stand for several hours, and then packing in a conical glass vessel known as a percolator. Alcohol is

Fig. 7.—Electrolytic Decomposition of Brine.

Alkali. Apparatus used in the production of chlorine soda by the electrolytic decomposition of brine. See text

Sodium carbonate is used in large quantities for softening water, in the manufacture of glass, sodium silicate, borax, soap, and soap powders. It is also used in the textile industry and the paper industry. Caustic soda, NaOH , is largely used in the manufacture of artificial silk, the soap industry, the textile industry, oil refining, and the manufacture of coal-tar intermediates used in the dyestuffs industry. Sodium bicarbonate is a principal constituent of baking powder, Seidlitz powders, and other "health salts." Sodium sesquicarbonate is used on a considerable scale in wool washing.

Sodium carbonate is also used on a large scale as a flux to remove sulphur from pig iron; sometimes a mixture of one part of sodium carbonate, three parts of limestone, and one part of fluorspar is used for this purpose. A similar process is used for the removal of impurities from copper, brass, bronze, nickel silver, and aluminium-silicon alloys. Details will be found in British Chemical Industry by Morgan and Pratt.

Just as the Leblanc process was superseded by the Solvay process, so the latter is being in part superseded by electrolytic processes for making chlorine and caustic soda by the electrolysis of brine. One such process in use in England employs anodes of carbon and cathodes of mercury, the latter being a thin stream that flows from one cell to another. A current of about 120 volts D.C. splits up the sodium chloride into chlorine and

forming a mixture of mercury and sodium amalgam which, after passing through the proper number of cells, flows into a stream of water and is decomposed, forming again mercury and a solution of caustic soda and liberating hydrogen, which is collected and used to make hydrochloric acid. Another electrolytic process uses the Gibbs cell in which carbon rods form the anodes and perforated iron plates are the cathodes; this cell produces hydrogen, chlorine, and caustic soda solution at separate outlets. Electrolytic manufacture of caustic soda has been developed on a large scale in America where electricity is cheap.

Sodium carbonate, not quite pure, is found in a few dried-up lakes in Egypt, Armenia, and India. It is also found in considerable quantity at Lake Magadi, in British E. Africa, where it is worked by Imperial Chemical Industries Ltd. The solution is evaporated, and the first crystals deposited consist of the double salt $\text{Na}_2\text{CO}_3 \cdot \text{NaHCO}_3 \cdot 2\text{H}_2\text{O}$; from this salt the other sodium carbonates are easily prepared.

Alkali Acts. Laws for restraining manufacturers of alkali from polluting the atmosphere by the fumes from their works. When salt is decomposed by sulphuric acid in the manufacture of sodium sulphate, which is the first stage in the Leblanc process of making sodium carbonate, large volumes of hydrochloric acid vapours are given off. This was formerly allowed to go into the atmosphere, being accounted a waste product.

then poured over the contents of the percolator and the liquid allowed to filter slowly through. This liquid is collected and concentrated, ammonia is added, and the liquid shaken with ether or chloroform.

The alkaloids are dissolved by the ether or chloroform, and as these liquids separate they are removed to another vessel. The chloroform or ether being then evaporated, the impure alkaloid remains. This is a very general statement, as experience has shown better methods of extraction in particular instances. There are several reagents which give precipitates when added to liquids containing alkaloids. The chief alkaloidal reagents are—(1) solution of iodine in potassium iodide; (2) solution of the double iodide of mercury and potassium; and (3) solution of phospho-molybdic acid. These reagents can be employed for both qualitative and quantitative tests. Certain distinctive colours given by sulphuric acid and ferric chloride are also indications of the alkaloid present.

Many alkaloids exactly represent the active medicinal agent of the plant, but sometimes the activity of a drug is due to more than one alkaloid—e.g. opium, cinchona bark, and nux vomica. Several of the alkaloids are violent poisons, but in appropriate doses form valuable medicines. Most of them are solids, but a few, such as coniine, are liquids. Attempts have been made to classify alkaloids, but no final method has been adopted. The principal alkaloids obtained from the vegetable kingdom are the following:

Aconite (*Aconitum Napellus*, etc.).—Aconitine, lycaconitine, atisine.
 Areca nut (*Areca catechu*).—Arecoline, arecaine, guvaine, guvacoline.
 Barberry (*Berberis vulgaris*).—Berberine, oxyacanthine, berbamine.

Belladonna group (*Atropa belladonna*, *Hyoscyamus niger*, *Datura stramonium*, etc.).—Atropine, hyoscyamine, hyosine.

Broom (*Cytisus scoparius*).—Sparteine.

Calabar bean (*Physostigma venenosum*).—Eserine or phys stigmine, eseramine, physoverine.

Calumba (*Jatropha palmata*).—Jatrohizine, columbamine, palmatine.

Cevadilla (*Veratrum Sabadilla*).—Cevadine, cevadilline, veratridine, sabadine, sabidinine.

Cinchona (*Cinchona officinalis*, etc.).—Quinine, quinidine, quinamine, quinicine, quinoidine, cinchonidine, cinchonine, cinchonidine,

cinchonamine, cupreine, concusconine.

Coca (*Erythroxylon coca*).—Cocaine, cocamine, truxilline.

Ergot (*Claviceps purpurea*).—Ergotinine, ergotoxine.

Golden seal (*Hydrastis Canadensis*).—Hydrastine, berberine, canadine.

Hellebore (*Veratrum album*).—Jervine, veratralbine.

Hemlock (*Conium maculatum*).—Coniine.

Ipecacuanha (*Cephaelis Ipecacuanha*).—Emetine, cephaeline.

Jaborandi (*Pilocarpus microphyllus*).—Pilocarpine, pilocarpidine.

Laburnum (*Laburnum vulgare*).—Cytisine.

Lobelia (*Lobelia inflata*).—Lobeline.

Lupine (*Lupinus luteus*, etc.).—Lupinine, lupinidine, lupanine, arginine.

Meadow saffron (*Colchicum autumnale*).—Colchicine.

Nux vomica (*Strychnos nuxvomica*).—Strychnine, brucine.

Opium (*Papaver somniferum*) (in order of discovery).—Morphine (1816), codeine, thebaine, papaverine, meconidine, codamine, laudanine, laudanidine, laudanose, lanthopine, protopine, cryptopine, papaveramine, rhoeadine, narcotine, gnoscopine, oxynarcotine, narceine, pseudomorphine, tritopine, hydrocotarnine, xanthaline (1893).

Papaw (*Carica papaya*).—Carpaine.

Pepper (*Piper nigrum*).—Piperine, piperidine.

Pink root (*Spigelia Marilandica*).—Spigeline.

Pituri (*Duboisia Hopwoodii*).—Pituarine.

Pomegranate (*Punica granatum*).—Pelletierine.

Potato (*Solanum tuberosum*).—Solanine, solanidine.

Stavesacre (*Delphinium staphisagria*).—Delphinine, delphisine, delphinidine, staphisagrine.

Tea, coffee, and cocoa (*Camellia Thea*, *Coffea Arabica*, *Theobroma cacao*).—Caffeine or theine, theobromine, theophylline, xanthine, adenine.

Tobacco (*Nicotiana tabacum*).—Nicotine.

Yellow jasmin (*Gelsemium sempervirens*).—Gelsemine, gelseminine.

Yohimboa (*Tahermontana species*).—Yohimbine, yohimbenine.

Of late years a series of artificial alkaloids has been prepared and a few are largely produced in this manner. For detailed information on specific alkaloids reference should be made to Henry's Plant Alkaloids, 3rd edn., 1939; and Thorpe's Dictionary of Applied Chemistry, 4th edn., 1937-43.

A. Shepherd

Alkalosis. Term used in medicine to describe the conditions in which there is an increase

in the alkali reserve of the blood. It may be induced by giving excess of sodium bicarbonate or other alkali.

Alkanet. Name of certain plants of the family Boraginaceae, such as *Anchusa officinalis* and *Alkanna tinctoria*; also of a colouring material obtained from the root of the latter species, which plant is a native of S. Europe. It is an herbaceous perennial with oblong, bristly leaves, and bright blue funnel-shaped flowers.

Alkanet,
Anchusa officinalis

Al-Khwarizmi. Arabian philosopher and mathematician. He was born early in the 9th century, apparently at Khwarizm, the modern Khiva, hence his name. About A.D. 830 he wrote an algebra on which the subsequent Arabian and early medieval works on algebra were founded, and through which the Arabic system of decimal enumeration was introduced into the West. Some proofs in it are geometrical. He wrote on arithmetic and compiled two astronomical tables. His Arabic name was Abu Ja'far Mohammed Ben Musa.

Al-Kindi, Abu Yusuf. Arabian philosopher and mathematician. Born at Basra in the 9th century, he wrote on most of the existing sciences, especially mathematics and logic, and on Aristotle. He is revered by the Arabs as the philosopher. A few of his writings on astrology and medicine are extant.

Alkmaar. Town of N. Holland, prov. of the Netherlands. On the N. Holland Canal, 4 m. from the sea and 20 m. by rly. N.W. of Amsterdam, it is the chief market for cheese in Holland, manufactures sail-cloth and exports sea-salt. Its architectural features include the 15th century church of S. Laurence, called usually the Great Church and containing some old tombs. There is a town hall and a weigh-house dating from 1582. The town walls have been pulled down. The town withstood a siege by the duke of Alva, Aug. 21-Oct. 8, 1573. Pop. 31,774.

Alkyl. Name given to a series of hydrocarbons of which methyl, ethyl, butyl, and amyl are the best known. Alcohol is the alkyl hydroxyl derivative of ethyl.

Alla Breve (Ital., according to the breve). Music which has the breve for its standard of time and minims for the beats, instead of the semibreve as the standard with crotchets for the beats: e.g.

Allah (Arab. *al*, the; *ilāh*, God). Name adopted by Mahomet for the Most High God and used as such by Arab-speaking Jews and Christians, as well as by Mahomedans. The Moslem creed is expressed in the words: *lā ilāha illa'llāh, wa Muḥammad rasūlu'llāh*, signifying, There is no God but God and Mahomet is the prophet of God.

Allahabad. Division, district, and city of India. Allahabad city, the capital of the United Provinces, stands on the left bank of the Jumna, at its confluence with the Ganges, 565 m. N.N.W. of Calcutta, and is served by the Oudh and Rohilkhand, the Bengal and North-Western, and the E. Indian Railways, the first two with bridges

Allahabad. The East Indian Railway bridge across the Jumna

Allahabad, India. Modern street in the ancient city. Above, Asoka's pillar bearing an inscription, of a date between 300 and 200 B.C.

over the Ganges, the last-named with a bridge over the Jumna.

A holy place from a very early period, it was not until the construction of the fort by Akbar, in 1575, that the city, known to the Hindus as Prayāg, acquired political importance. In 1801 it was ceded to the English, and was the scene of a massacre during the Mutiny in 1857. Its industries include an iron foundry, indigo factories, and printing presses. It has a wireless station, and

among its principal buildings are the government house, the Mayo memorial hall, the Thornhill and Mayne memorial, with a public library and museum, the Anglican and the Roman Catholic cathedrals, the university, and the Muir college. The fort, beneath which the Saraswati is supposed to unite with the Ganges and Jumna, contains an underground temple (with a tree stump known as the undying banyan) and the Pillar of Asoka,

on which is inscribed an edict by that emperor (3rd century B.C.). Outside the fort are the mausoleum and gardens of Khusrū. The Jumma Musjid, or Great Mosque, was pulled down in 1157. An annual religious festival, the Magh Mela, is held on the sand below the fort in Dec.-Jan., when pilgrims assemble to bathe at the junction of the rivers. The district has an area of 2,858 sq. m. and produces grain, cotton, oil-seeds, sugar, and ghi. Pop. of city 260,630.

Allahabad, UNIVERSITY OF. Institution set up in 1887 as an examining and inspecting authority over higher education in the United Provinces of Agra and Oudh. In 1921 it was reorganized as a unitary teaching and residential university, but retained control over many affiliated colleges. These were transferred in July, 1927, to the new university at Agra. Degrees are awarded in arts, science, law, and commerce. In 1941 there were over 2,800 students, more than 500 being graduates.

Allamanda. Genus of S. American climbing shrubs of the family Apocynaceae. They have evergreen leaves and golden-yellow flowers, except *Allamanda violacea*, which has reddish-violet flowers.

An infusion of the leaves of *A. cathartica* in moderate doses is a valuable medicine in painter's colic, though in stronger doses it is violently emetic and purgative. The name comes from the Swiss scientist Allamand (1713-87).

Allamanda, American climbing shrub

Allan, DAVID (1744-96). Scottish painter. Born at Alloa, he went to Italy at the age of twenty to pursue his studies, painting in the style of Poussin. He returned to Britain in 1777, and after supporting himself by portrait painting in London, settled in Edinburgh, where he was made master of the Academy in 1786. He is sometimes referred to as the Hogarth of Scotland. Allan's self-portrait is in the Scottish National Gallery.

Allan, SIR HUGH (1810-82). Canadian shipowner. Born at Saltcoats, Ayrshire, Sept. 29, 1810, Allan went in early life to Canada, where he became partner in a shipping firm. About 1852 he founded the Allan line of steamers and was one of the promoters of the C.P.R. His donation to the party funds in Canada in 1873 was denounced as corruption and largely brought about the Conservative defeat at the ensuing general election. Knighted in 1871, he died in Edinburgh, Dec. 9, 1882. His son, Sir H. M. Allan (b. 1860), was knighted in 1904.

Allan, MAUD (b. 1879). British dancer. Born at Toronto of English parents, and educated at San Francisco, she studied music at Berlin and classical art in Italy. Fired with the desire to revive the classic dance, she first appeared as a professional dancer in Vienna in 1901, and later achieved success as a dancer in London and in the U.S.A. She is remembered for her performance of Salome in 1908. Returning to England in 1928, she devoted herself to teaching very poor children and later to preparing material for a work on her life.

Allan, SIR WILLIAM (1782-1850). Scottish painter. Born in Edinburgh, he was apprenticed to a coach-painter, and later studied at the R.A. schools in London. After residing in Russia, 1805-14, he returned to Edinburgh and took to

genre and history painting, finding subjects in The Waverley Novels. His Regent Moray Shot by Hamilton secured his election as A.R.A., and in 1834 he became R.A. Four years later he was elected president of the Royal Scottish Academy, and in 1841 succeeded Sir David Wilkie as limner to the queen in Scotland, an office which carried a knighthood. In 1843 he exhibited his Waterloo, which was purchased by the duke of Wellington. In 1844 he again went to Russia to obtain materials for his picture of Peter the Great Teaching his Subjects Shipbuilding. While engaged on a picture of the battle of Bannockburn, he died in his studio in Edinburgh, Feb. 23, 1850.

Allan, SIR WILLIAM (1837-1903). British politician and engineer. Born at Dundee, Nov. 29, 1837, he served in the navy as an engineer. In 1866 he settled in Sunderland, where he built up a big engineering business. He was one of the first employers to establish an eight hours working day. From 1893 until his death Allan was Liberal M.P. for Gateshead. Knighted in 1902, he died Dec. 28, 1903. He wrote much Scottish verse.

Allan Line. Former British steamship company. Established in Montreal by Sir Hugh Allan about 1852 as the Montreal Ocean Steamship Company, it was the first to adopt steel in the construction of its vessels, the turbine as a method of propulsion, and twin screws and bilge keels for checking oscillation. In 1917 the control was taken over by the Canadian Pacific Ocean Services, Ltd. (later Canadian Pacific Steamships, Ltd.).

Allantois (Gr. *allas*, sausage). Term denoting an anatomical structure found in mammals, birds, and reptiles. Its function is to secure the oxygenation for the embryo of these groups.

Alle. River of Poland and Russia, formerly of E. Prussia. It is a tributary of the Pregel, into which it falls 30 m. above Kalinigrad, and is about 125 m. long.

Allegation (Lat. *allegare*, to bring forward). English legal term. It means a statement as

yet unproved, but which those responsible for it believe to be true. Thus a phrase such as an alleged criminal is often applied to a person accused of crime before the charge has been substantiated in a court of law. In civil actions the facts necessary to establish the claim or defence are set out in allegations in the pleadings. Every allegation not specifically or impliedly denied or stated to be "not admitted" in the pleading of the other party is with some few exceptions taken to be admitted. See Libel.

Allegheny OR ALLEGHANY. River of U.S.A. Rising in the N. part of Pennsylvania, it passes into New York and curves again into Pennsylvania, where it follows a S.W. and S. course to Pittsburgh and unites with the Monongahela to form the Ohio. Its length is

Sir William Allan, British engineer

about 300 m., and it is navigable by small vessels for nearly 200 m. **Allegheny.** Industrial suburb of Pittsburgh, U.S.A. Formerly a city of Pennsylvania, it stands on the right bank of the Ohio river. It has several important educational institutions, a public library, observatory, and state penitentiary. An important rly. centre, on the Baltimore and Ohio and other rlys., it engages in the manufacture of pickles and preserves, and has rolling mills, foundries, breweries, etc. It gives its name to a county with a pop. of 1,411,539.

Allegheny Mountains. Name sometimes applied to the Appalachian Mts., U.S.A., but more correctly to a W. division of that system. This comprises a series of parallel and uniform ridges forming the watershed of rivers flowing to the Gulf of Mexico and Atlantic Ocean. Their forests yield much timber, and their output of iron, coal, and brimstone is valuable. Their mean elevation is about 2,500 ft. See Appalachians.

Allegiance (Lat. *ad*, to, *ligere*, to bind). Tie of obedience which binds a subject to the sovereign. A born subject of the Crown is said to owe *natural* allegiance to the King, and his Majesty is called his "natural liege lord." A person cannot be guilty of treason unless he owes allegiance to the Crown, for treason is essen-

Maud Allan, British dancer, remembered chiefly for her representation of Salome

Sir William Allan, Scottish painter

tially the violation of that allegiance. It would thus be impossible to charge with treason enemy subjects who secretly entered the country and committed offences against the state. It was partly in order to deal with such cases that the Treachery Act, 1940, was passed. See Sovereignty.

Allegory (Greek *allos*, other; *agoreuein*, to speak). Presentation or description of one thing under the image of another. It is a figure most frequently employed in literary composition, but also used in painting, as by Holman Hunt in *The Light of the World*, G. F. Watts in *Hope*, and Burne-Jones in *Love Leading the Pilgrim*, and less frequently in sculpture.

In literature allegory is a persistent form, owing to its convenience in permitting the presentation of abstract ideas in concrete forms. Plato's account of the cave in Book VIII of *The Republic* is a well-known instance of allegory in classical literature. Christ's parables are mostly allegorical, though the term is chiefly employed of the more sustained use of the figure. Early English literature is rich in allegory; Langland's *Vision of Piers Plowman* and Chaucer's *Romaunt of the Rose* being examples. It was one of the principal agents in the miracle plays and moralities which preluded the rise of the drama—Everyman is a notable example—and it merged in the drama itself, in the stamping of characters with names showing them to be personifications of different human qualities.

Allegretto. Musical term, meaning rather cheerful or lively. It is a diminutive of Italian *allegro*.

Allegro. Italian musical term meaning quick and lively.

Allemande (Fr. for German). Musical term used in several distinct senses. (1) Movement in the suites of Bach, Handel, and others, founded on the dance, treated in a solid, contrapuntal style. (2) A slow, graceful dance of German origin, popular under Napoleon I, was called the allemande. Ben Jonson, in *The Devil is an Ass*, mentions a dance called almain.

Allen. Lough or lake of Connacht prov., Eire. About 5 m. long by 3 m. broad, with an area of 8,900 acres, it is on the upper course of the river Shannon, in counties Leitrim and Roscommon.

Allen, Bog of. A tract of bogland in the province of Leinster, Eire. It extends into the counties of Kildare, Offaly, Laoighis,

and Westmeath, and its area is about 240,000 acres. It is not quite a continuous bog, strips of arable being found here and there. The peat goes down on the average for about 25 ft., and its nature varies from surface moss to lignite, while oak stumps and pine trunks are also found.

Allen, REGINALD CLIFFORD, 1ST BARON ALLEN OF HURTWOOD (1889–1939). English politician. Born at Newport, Mon., May 9,

Clifford Allen,
1st Baron Allen
of Hurtwood

1889, he became a leader of the Fabian group at Cambridge University. From 1911 to 1915 he was manager of the first Labour daily newspaper, *The Daily Citizen*. During the First Great War he was a prominent pacifist and three times went to prison as a conscientious objector. He was chairman of the Independent Labour Party 1922–1926. When the National Government was formed in 1931, he followed Ramsay MacDonald as one of the small National Labour group, and in 1932 was raised to the peerage. In later years his political outlook was that of a moderate without party affiliation. He died at Montana-Vermala, Switzerland, on March 3, 1939.

Allen, CHARLES GRANT BLAIR-FINDIE (1848–99). British author, better known as Grant Allen. Born at Kingston, Canada, he was educated at

King Edward's School, Birmingham, and Merton College, Oxford, and was professor and principal at Spanish Town, Jamaica, 1873–7. Allen was both a popular scientist and a popular novelist. His scientific attainments were considerable, and he was a luminous and entertaining writer on evolution and on biological and botanical subjects. His many novels include *The Woman Who Did*, 1895, which provoked much discussion. He died in London, Oct. 25, 1899. Consult Life, E. Clodd, 1900.

Allen, ETHAN (1737–89). American soldier. Born at Litchfield, Connecticut, he settled in Vermont and became a prom-

inent figure in the politics of that state, then in conflict with New York. In the Revolution he led a band of men against Fort Ticonderoga, which the British surrendered to him, and he served afterwards in an expedition against Canada. In 1775, near Montreal, he was taken prisoner and sent to England. After his return to Vermont he was accused of treason, on the ground of some correspondence with Sir Frederick Haldimand, the governor of Canada. He died Feb. 11, 1789.

Allen, GEORGE (1831–1907). English publisher. His association with John Ruskin is one of the romances of publishing. A skilled engraver and draughtsman, he came into touch with Ruskin while attending the Working Men's College, Great Ormond Street, London, and in 1871 was induced by him to become "the Master's" publisher, operating from his rural home at Orpington, "in the middle of a country field in Kent," as Ruskin put it. In time Allen's name became famous among London publishers, but after his death in 1907 his business declined. His name is still honoured in the publishing firm of George Allen & Unwin, of which Stanley Unwin became head.

Allen, SIR HARRY BROOKES (1854–1926). Australian physician. Born at Geelong, June 13, 1854, he graduated in medicine at Melbourne University, where he was appointed demonstrator in 1876. He was made professor of pathology in 1882, later dean of the school, and was knighted in 1914. He created the museum of pathology at Melbourne, wrote books on cancer, tuberculosis, etc., edited *The Australian Medical Journal*, and obtained recognition in Europe for the medical degrees of Melbourne University. He died March 28, 1926.

Allen, HERVEY (b. 1889). U.S. writer. Born at Pittsburgh, Pennsylvania, on Dec. 8, 1889, he became a graduate of Harvard, Litt.D. and F.R.S.A. He served in the U.S. navy and joined the U.S. army during the First Great War. After publishing several volumes of poetry and a notable biography of Poe (1926), he achieved immense success with his long historical novel, *Anthony Adverse*, 1933. This was followed by *Action in Aquila*, 1938, and a trilogy of novels under the general title of *The Disinherited*, of which the first book, *The Forest and the Fort*, was published 1943, the second, *Bedford Village*, 1944.

Grant Allen.
London Stereoscopic Co

Allen, Sir Hugh Percy (1869–1946). British musician. He was born at Reading, Dec. 23, 1869, and educated at Kendrick School, Reading, and Christ's College, Cambridge. At the age of eleven he was appointed organist of St. Saviour's, Reading. He subsequently held many similar appointments, and became closely associated with the music of both Oxford and Cambridge and developed the musical life of the universities. He was director of the Royal College of Music, 1919–37, was appointed professor of music at Oxford, 1918, and became president of the Royal College of Organists. He was conductor of the London Bach Choir and the Oxford Bach Choir. He was knighted in 1920, created K.C.V.O. in 1928, and G.C.V.O., 1935. He died Feb. 20, 1946.

Sir Hugh Allen,
British musician

Allen, Sir James (1855–1942). New Zealand politician. Born in S. Australia, and educated at

Sir James Allen,
N.Z. politician

Clifton and St. John's College, Cambridge, he became a mining engineer. Settling in New Zealand, he entered the legislature in 1887, and in 1912 was made minister of finance, education, and defence. He had much to do with sending New Zealand troops to the First Great War, and in 1917 was made a K.C.B. In 1919 he was made minister for external affairs. He was High Commissioner for New Zealand, 1920–26, and a member of the legislative council from 1927 to his death, July 28, 1942.

Allen, James Lane (1849–1925). American novelist. Born at Lexington, Kentucky, and educated at Transylvania University, for some years he was a schoolmaster, then a teacher at Kentucky University, afterwards acting as professor of Latin

James Lane Allen,
American novelist

at Bethany College, West Virginia. His novels, poetically conceived and delicately written transcripts of life in his native state, include *A Kentucky Cardinal*, 1895; *The Choir Invisible*, 1897; and *A Cathedral Singer*, 1916. He died Feb. 18, 1925.

Allen, Ralph (1694–1774). English postal reformer. On becoming deputy postmaster at Bath, he devised a system of cross-posts in England and Wales, which from 1720 to his death yielded him a profit of £500,000. His wealth, increased by the successful working of stone quarries near Bath, was lavishly expended, and Allen became known as *The Man of Bath*. Fielding has drawn him as *Squire Allworthy* in *Tom Jones*.

Allen, William (1532–94). English cardinal. Born of Roman Catholic parents at Rossall, Lancashire, and

William Allen,
English cardinal

educated at Oriel College, Oxford, he was appointed principal of S. Mary's Hall, Oxford. He left England soon after the accession of Elizabeth

and was largely responsible for the foundation in 1568 of the college for English priests established at Douai and afterwards transferred to Reims. He began the translation of the Douai Bible. *See Bible.* The main aim of Allen's life was to restore Roman Catholicism in England. At first he worked quietly, training priests for propaganda work, and to the last his students had no political course of study, but about 1582 his own activities became definitely political. He supported Philip II and worked with the pope, Mary Queen of Scots, Guise, and certain of the Jesuits against Elizabeth. He signed, if he did not write, *An Admonition to the Nobility and People of England* (1588), which urged them to depose Elizabeth. In 1587 he was made cardinal, and in the event of the success of the Spanish Armada he was to become papal legate, lord chancellor, and archbishop of Canterbury. He resided at Rome from 1588 until his death, Oct. 16, 1594. *Consult* An Elizabethan Cardinal, Martin Haille, 1914.

Allen, Zachariah (1795–1882). American inventor. Born at Providence, Rhode Island, Sept. 15, 1795, he was educated at Brown University and became a barrister,

but abandoned law to enter industry. His inventive genius soon established him in Rhode Island. His most successful inventions were the hot-air furnace for central heating, 1821, and the automatic cut-off valve for steam engines, 1833. He is also memorable as the first person to calculate the available power of Niagara Falls. He died at Providence, March 17, 1882.

Allenby, Edmund Henry Hynman Allenby, 1st Viscount (1861–1936). British soldier. Born April 23, 1861, he was educated at Haileybury and entered the army, the Inniskilling Dragoons, in 1879. His earliest active service was in the Bechuanaland expedition of 1884–5, and he was in Zululand in 1888. He served with the Inniskillings throughout the South African War, and was selected in 1902 to command the 5th Lancers. The command of a brigade followed, and in 1914, when the First Great War broke out, Allenby was inspector-general of cavalry at Aldershot. He took out the cavalry division to France, was with it at Mons, and later, when it became a corps, took charge of it.

In 1915, being then a K.C.B., he succeeded Sir Herbert Plumer in command of the 5th corps, and when the battle of the Somme began had been appointed to the Third army. He led that force at the battle of Arras in 1917, but in June of that year was sent to take command of the expeditionary force in Egypt. He reorganized this after the check before Gaza, and was responsible for the campaign that drove the Turks from Palestine and

Field-Marshal Viscount Allenby,
whose campaign liberated Palestine
in the First Great War

recovered Jerusalem for the Christians in Dec. Next year he routed the Turks at Megiddo, Sept. 19, and took Damascus and Aleppo.

Full general by 1917, Allenby was in 1919 promoted field-marshal, was voted a sum of £50,000, and was created a viscount, adopting the title of Viscount Allenby of Megiddo and Felixstowe. For six years he was high commissioner of Egypt and the Sudan. He died suddenly on May 14, 1936. His only son had died of wounds in France in 1917, and a nephew, Dudley Allenby (b. 1903), succeeded to the viscounty by special remainder. See Palestine (p. 6300). Consult Allenby, Soldier and Statesman, F.-M. Visct. Wavell, 1946.

Allenstein. German and better known name of Olsztyn, capital of the Polish prov. of Masuria (*q.v.*). It is 62 m. S. of Kaliningrad (Königsberg). In mediæval times the h.q. of the grand master of the Teutonic knights, it was his official seat up to its capture by the Russians Jan. 22, 1945, in the Second Great War. A German army corps h.q. before the First Great War, it was captured by the Russians in Aug., 1914, but evacuated by them during the struggle around Tannenberg. It formerly manufactured cement, umbrellas, matches, etc. Pop. (1939) 45,000.

Allentown. City of Pennsylvania, U.S.A. The county seat of Lehigh co., it is on the Lehigh river. It is 60 m. by rly. N. by W. of Philadelphia, on the Philadelphia and Reading and other rlys. It manufactures furniture, silk, and cement, and has large ironworks, rolling-mills, and forges. Pop. 96,904.

Alleppi. Seaport of Travancore, extreme S. of India. It is 33 m. S. of Cochin, has a fine harbour, and exports coffee, coconuts, and spices. Pop 32,044.

Allergy. Term, originated by von Pirquet, meaning an altered tissue reaction resulting in a condition of unusual sensitiveness to a substance which is harmless in similar amounts for the majority of members of the same species. In some persons, the swallowing or breathing of certain substances, or even the mere contact with them, gives rise to more or less violent constitutional symptoms and local reactions. For example, the ingestion of egg-white produces no ill effects in most individuals, but in a few hypersensitive individuals a minute amount may produce either severe gastro-

intestinal disturbances, urticaria, eczema, or asthma. Contact with plant pollen will excite an attack of hay fever in a specifically sensitive person. Treatment of allergic conditions depends largely upon the discovery of the causative factor. The offending substances, called "allergens," are numerous and widely distributed. The term "allergy" is often popularly misused to describe a condition of intolerance to ordinary amounts of a substance producing an exaggerated, but not unusual, action, *e.g.* in a person intolerant to aspirin an ordinary dose may produce an exaggerated physiological effect, such as ringing in the ears, deafness, etc., whereas in an individual allergic to aspirin, a minute dose may produce unusual symptoms such as sneezing attacks, urticaria, or asthma. See Anaphylaxis.

Allerion. In heraldry, a beakless, legless eaglet, with wings opened, points usually downwards.

Allerton, WILLIAM LAWIES JACKSON, 1ST BARON (1840-1917). British politician. He was an M.P. for Leeds 1880-92, becoming chief secretary for Ireland, 1891, and receiving a peerage 1892. For over 20 years he was chairman of the Great Northern Rly.

Alleyne, EDWARD (1566-1626). English actor and founder of The College of God's Gift, at Dulwich. He was born in the parish of St. Botolph, Bishopsgate, London, Sept. 1, 1566, and the earliest mention of him as an actor occurs in 1586, and in 1592 Thomas Nash speaks of him as one of the four great contemporary performers. With Philip Henslowe (*q.v.*), whose stepdaughter, Joan Woodward (d. 1623), he married, he was a partner in the earl of Nottingham's company, known also as the Lord Admiral's company.

In 1600 the two partners built the Fortune Theatre in Golden Lane, Cripplegate, and in 1604 obtained a patent making them joint-masters of the royal game of bears, bulls, and mastiff-dogs. Between 1605 and 1614 Alleyne purchased from Sir Francis Carlton the manor of Dulwich for £10,000, and in 1613 began building the college, with chapel and almshouses, obtaining a royal charter for incorporating and endowing the charity in 1619. He died Nov. 25, 1626, and was buried in Dulwich College chapel. His favourite parts seem to have been the heroes of Marlowe's plays—the Jew of Malta, Tamburlaine, and Faustus—and Orlando in Greene's Orlando

Furioso. Consult Memoirs, J. P. Collier, 1841; Dulwich MSS.

All Fools' Day or APRIL FOOLS' DAY. The popular names for April 1, derived from the custom of playing practical jokes on that day, usually until noon. The origin of the custom, apparently unknown in Great Britain until the 18th century, is obscure. It is possibly connected with the festivities of the spring equinox, one of the features of the ancient Indian spring feast of Huli being an exact counterpart of European April fooling.

The custom may have arisen in Europe as a travesty of New Year gifts and visits, when the reformed calendar transferred the beginning of the year from April 1 to Jan. 1. In France an April fool is called a *poisson d'avril* (April fish), possibly because a young spring fish is easy to catch. An April fool is known in Scotland as a gowk (cuckoo), and April fooling as hunking the gowk, the cuckoo being reputed a foolish bird.

All for Love, or THE WORLD WELL LOST. Tragedy in five acts by John Dryden. Based on the story of Antony and Cleopatra (*q.v.*), it was produced at the Theatre Royal, Drury Lane, London, in 1678, and frequently revived, a notable modern revival being that of the Phoenix Society at the Shaftesbury Theatre, London, 1922.

All-Fours. An American card game, possibly the oldest. The name is derived from the four chances or points, called respec-

tively High, Low, Jack, and Game. A full pack of 52 cards is used, the ace being the highest and the deuce the lowest, both in play and in cutting for deal. The following are the points to be scored—*High*: The highest trump out; the holder scores one point. *Low*: The lowest trump out; the original holder scores one point. *Jack*: The knave of trumps; the holder scores one point, unless the card is won by an adversary, when the winner scores the point. *Game*: The greatest number of points contained in the tricks won by either player, reckoning thus, each ace, four; each king, three; each queen, two; each knave, one; and each ten, ten. The holder of the highest total scores one point towards the game.

The game is played by two or three persons, or four players in partnerships of two. The dealer, after being determined by cutting, gives six cards to each player, three at a time, after which he turns up the next card for trumps. The elder hand, if he dislikes his cards, has the privilege of saying "I beg"; in this event the dealer must allow him to score one point, or give each player three cards more from the pack and turn up the next for trumps. If the trump then turned up be of the same suit as before, he must continue giving each player three cards and turning up the next until another trump suit is shown. If a jack is turned up for trumps it counts one point to the dealer. Tricks are made exactly as in whist. When all the tricks are played out the points are counted for High, Low, Jack, and Game.

The skill of the game consists in winning the knave of trumps, taking the tens, and endeavouring to draw the adversaries' best cards. The points for high and low are scored by their original holder; the knave of trumps counts to the owner of the trick containing it. The number of points played for is usually 7, 9, or 11. High and low points may both be made by the same card, if the only trump out, and in the case of the knave it can count as High, Low, Jack, and Game.

Blind All-Fours is the game usually played by two persons, the first card led by the non-dealer establishing the trump suit. There is no begging, and the points played for are usually 7 or 9.

Allgemeine Zeitung, DIE (The General News). German daily newspaper. Independent liberal in tone, it was founded at Stuttgart by Johann Friedrich Cotta. Cotta

desired Schiller to be editor, but the paper appeared on Sept. 9, 1798, under the editorship of L. F. Huber. Suppressed by the duke of Württemberg in 1803, it moved to Ulm, and thence to Augsburg, where it attained European repute. In 1882 it was transferred to Munich. In 1908 it became a weekly, in 1912 a monthly periodical, and has since ceased publication. It was often confused with the Norddeutsche Allgemeine Zeitung, Bismarck's Berlin daily, which became the Deutsche Allgemeine Zeitung the day following the signing of the armistice in Nov., 1918.

Allgood, SARA (b. 1883). Irish actress. She was born in Dublin, Oct. 31, 1883, studied for the stage, and under the auspices of the Irish National Theatre Society made her début at the Royalty Theatre, London, 1904. At the Abbey Theatre (q.v.), Dublin, she subsequently created such parts as Molly Byrne in Synge's *Well of the Saints*, Widow Quin in the same dramatist's *The Playboy of the Western World*, and Cathleen in Yeats's *Cathleen-ni-Houlihan*. Her greatest successes, however, were achieved in London during the 1920s, in Sean O'Casey's *Juno and the Paycock*, and *The Plough and the Stars*.

All-Hallows, ALL-HALLOWMAS OR HALLOWMAS. O.E. name for All Saints' Day (q.v.). See also *Hallow-e'en*.

Allia OR ALIA, BATTLE OF THE. Fought July 16, 390 B.C., between the Romans and invading Gauls under their leader Brennus, on the banks of a small stream of that name, a tributary of the Tiber. The Romans were defeated, and the Gauls advanced and sacked Rome. The date of this defeat was afterwards known as *dies Alliensis* (day of Allia) and marked as unlucky in the Roman calendar.

Alliance (Lat. *ad*, to; *ligare*, to bind). Term applied generally to any compact between two or more states in regard to their common action or inaction in relation to other states. Of such historic compacts the majority have had no specific title.

The more important alliances down to the 17th century were generally called leagues. Later a small number bore the actual name of alliance. Of these the most notable were the Triple Alliance of 1668 between England, the United Provinces, and Sweden, directed to checking the aggression of Louis XIV.; the Grand Alliance of 1689, an extension of the League of Augsburg, a coalition between the Hapsburgs, Holland, and England against Louis XIV.; the renewed Grand Alliance of 1701, with the same object in view, which preceded the War of the Spanish Succession; the Quadruple Alliance of 1718 between Great Britain, France, Holland, and Austria against Philip V of Spain and the policy directed by Cardinal Alberoni.

Then, with an interval of nearly a century, came the various alliances against Napoleon, and after his overthrow the Holy Alliance, conceived by Tsar Alexander I of Russia as a league between the Christian princes, pledging them individually to rule their own subjects on Christian principles and mutually to support each other's authority. This alliance, from which England held aloof, embraced most of the monarchs of Europe, and was a dominating factor

in European politics during the ten years after Waterloo. After another long interval came the Triple Alliance between Germany, Austria, and Italy, which was formed in 1883 and came to an end in 1915. The name of the Triple Alliance has also been given to a compact made between Great Britain, Prussia, and Holland in 1788.

Powerful alliances faced each other in the First Great War. Germany and Austria-Hungary, survivors of the Triple Alliance of which Italy had been the third partner, were joined by Turkey and Bulgaria. These allies were generally known as the Central Powers. The opposing alliance originating in that between France and Russia, consisted before the end of the war of seventeen other nations, though not all actually participated in the fighting. They

Sara Allgood, one of the original Abbey Theatre players, in *Juno and the Paycock*

were (in order of the date of entry into the war) Belgium, Great Britain (and the British Empire), Serbia, Montenegro, Japan, Portugal, Italy, Rumania, the U.S.A., Cuba, Panama, Greece, Spain, Liberia, China, Brazil, Guatemala. The U.S.A. did not ally herself with the other Powers in the strict sense of the term, and the correct designation of this combination was therefore the Allied and Associated Powers. *See* First Great War, 1914-1918.

A new Triple Alliance was formed in 1919 between Britain, France, and the U.S.A., to safeguard France against aggression by Germany, but this was never ratified by the U.S. senate and so was of no great effect. In its place France built up a system of alliances with the "succession states," which also joined in the Little Entente (*q.v.*), and the Balkan Entente (*q.v.*). Germany retaliated in 1936 with the Anti-Comintern Pact with Japan, extended in 1937 to include Italy. The governments, real or "puppet," of several other states joined later. The Rome-Berlin Axis, originally a political gesture, became a military alliance between Germany and Italy in 1939.

For the Grand Alliance of the United Nations, signed originally by the representatives of 26 nations at Washington, Jan. 1, 1942, *see* Washington Declaration.

The oldest extant alliance is that between England and Portugal, concluded in 1373.

Alliance. City of Ohio, U.S.A., in Stark Co. On the Mahoning river, it is a junction on the Pennsylvania and other rlys., 57 m. S.S.E. of Cleveland. It has rolling mills, steel and boiler works, and manufactures machinery, etc. Pop. 22,405.

Allibone, SAMUEL AUSTIN (1816-89). American bibliographer. He was born at Philadelphia. His chief work was *A Critical Dictionary of English Literature and British and American Authors*, 3 vols., 1859-71, which contained notices of 46,499 authors. To the third volume Allibone affixed a brief Valedictory to be

reproduced in all editions of the work, and a series of forty indexes of over 75,000 names classified under different branches of literature. He was appointed head of the Lenox Library, New York, 1879, and died at Lucerne, Switzerland, Sept. 2, 1889.

Allied Expeditionary Force. Official name given to the forces of Inter-Allied Command organized for the invasion and liberation of German-occupied Europe in the Second Great War. On Dec. 24, 1943, it was announced that Gen. Eisenhower had been appointed Supreme Allied Commander of these forces. Other appointments, announced Dec. 27-29, included those of Gen. (later F.-M.) Sir B. L. Montgomery as C-in-C. of the British group of armies, Air Chief Marshal (later Marshal of the R.A.F.) Sir A. Tedder as Dep. Supreme Commander, Adm. Sir B. Ramsay as Allied Naval C-in-C., and Air Chief Marshal Sir T. Leigh-Mallory as Allied Air C-in-C. The last-named, lost in a plane accident in Nov., 1944, was replaced by Air Marshal Sir Keith Park. When Adm. Ramsay was killed in another plane crash, Jan. 3, 1945, he was succeeded by Vice-Adm. Sir H. Burroughs.

With the establishment of a western front following the Normandy landings of June 6, 1944, the composition of the Allied armies in France was as follows: The 21st army group (Gen. Montgomery) comprised the Canadian 1st army (Gen. Crerar) and the British 2nd army (Lt.-Gen. Dempsey). The latter army included the Polish 1st armoured div., the Belgian brigade, the Netherlands (Princess Irene)

brigade, and the Czecho-Slovak brigade. The 12th army group (Lt.-Gen. Bradley) comprised the U.S. 1st army (Lt.-Gen. Hodges), the U.S. 3rd army (Lt.-Gen. Patton), and the U.S. 9th army (Lt.-Gen. Simpson); and the 6th army group (Lt.-Gen. Devers) comprised the U.S. 7th army (Lt.-Gen. Patch) and the French 1st army (Gen. de Tassigny), both of which landed in the S. of France Aug. 15, 1944, being incorporated in the A.E.F. when they linked up the following month. The Allied 1st Airborne army (Lt.-Gen. Brereton) comprised U.S., British, and Polish divs.

In the initial stages Montgomery was in full command, but at the beginning of Aug., 1944, with the general advance into France of U.S. forces, Eisenhower moved his Supreme H.Q. (S.H.A.E.F.) to France, and Montgomery and Bradley each took over equal responsibility for his own separate army group. In March, 1945, the American 15th (Lt.-Gen. Gerow) was added to Bradley's command. In Dec., 1944, when the German counter-thrust into the Ardennes threatened the Allied front in Belgium, Montgomery was given temporary control of the four Allied armies N. of the German salient, *viz.* the British 2nd, Canadian 1st, and U.S. 1st and 9th, retaining control of the U.S. 9th for the Rhine crossing. S.H.A.E.F. was finally dissolved July 13, 1945. *See* Europe, Liberation of.

Allied Military Government. System of civil administration set up by the Allies in the later stages of the Second Great War, as enemy and enemy-occupied

Allied Expeditionary Force. Members of the Supreme Command at their headquarters, Feb., 1944. Left to right: Lt.-Gen. Omar Bradley, Senior Commander, American ground forces; Admiral Sir Bertram Ramsay, Allied Naval Commander; Air Chief Marshal Sir Arthur Tedder, Deputy Supreme Commander; General Dwight D. Eisenhower, Supreme Commander; Gen. Sir Bernard Montgomery, C-in-C. British group of armies; Air Chief Marshal Sir Trafford Leigh-Mallory, Allied Air C-in-C.; and Lt.-Gen. W. Bedell Smith, Chief-of-Staff

Photo, "The Times"

territory began to fall into their hands. It was first formed on the Allied occupation of Sicily in the late summer of 1943. Its object was to control and exploit the civil as well as the military aftermath of victory. Officials were recruited from men with professional experience of central and local government, many of whom had an extensive knowledge of European countries and were given special training courses in modern proconsulship. At the Moscow conference in Oct., 1943, the United Nations agreed to extend control organizations to Italy, under the general name of Allied Military Government of Occupied Territory, abbreviated to "Amgot." In all areas behind the combat zones "Amgot" was gradually replaced by Italian administration, exercised under the supervision of a control commission in four groups: military, political, economic and administrative, and communications. "Amgot" went forward with the 15th army group then fighting the Germans in Italy to organize the territory as the Germans were expelled. It pressed forward as a spearhead, taking charge of communities disorganized by the German retreat, restoring civil life, and clearing the way for further military action in the forward areas.

From Feb., 1945, the function of the control commission towards the Italian government was greatly modified in favour of the latter. Thenceforward Italy conducted her relations with other governments directly, not through the commission. She became free to appoint and receive ambassadors to and from all Allied and neutral countries and was given sole responsibility for administrative appointments. The Allied control commission in Italy officially ceased to function as from Feb. 1, 1947.

In Germany, Allied Military Government was first established in the Aix-la-Chapelle and Trier districts of Germany in Sept., 1944. Eisenhower, supreme Allied C.-in-C., in a broadcast to the people of W. and S.W. Germany, stated that supreme legislative, judicial, and executive authority and powers were vested in himself as supreme commander and military governor; and that German courts and educational institutions within the occupied territory were suspended. All officials were commanded to remain at their posts until further orders and to

obey and enforce all orders of the military government or the Allied authorities.

The first trial to be held on German soil by the Allied military court was on Sept. 27, 1944, at Kornelimünster, in the Aix-la-Chapelle area, when four German civilians were charged with violating Allied restrictions on travel, and two others with the unauthorized sale of coal. On Oct. 18 it was stated that a code of 70 laws, already in application in the occupied areas of the Reich, were to be applied with the extension of further territory and would be put into operation by "teams" of Anglo-U.S. officers.

With the establishment of the Allied Control Commission in Berlin, June 5, 1945, the work of Allied Military Government in Germany was gradually superseded. See Germany.

Allier. River of central France. Rising in Lozère and flowing N.N.W. through Haute-Loire, Puy-de-Dôme, and Allier departments, it joins the Loire about 4 m. below Nevers. Of its 356 m., 140 m. are navigable.

Allier. Department of central France. Its area is 2,848 sq. m. Bordered by the Loire, traversed by the Allier, and embracing some of the richest land in France, it produces wine, cereals, oil, roots, cattle, and timber, and is rich in coal, iron, manganese, antimony, copper, marble, granite, and potter's clay. It contains the town of Vichy (q.v.). Moulins is the capital. Pop. 368,778.

Alligator (Span. *el lagarto*, the lizard). Genus of the crocodile family. It is distinguished from the true crocodile by the fact that the fourth tooth from the front on each side of the lower jaw fits into a cavity in the upper jaw and is not seen when the mouth is closed. Of the two living species the Chinese alligator is comparatively small and only recently known to science. The Mississippi alligator, which attains 16 ft. in length, is an inhabitant of the southern states of N. America, lives in the rivers, and feeds mainly on fish, though it levies a heavy toll

on animals that come down to drink. The eggs, which may amount to 100 from one female, are laid among the bushes on the banks and covered with decaying vegetable matter. The heat of the sun hatches them, and the female watches her nest and conducts the young to the water.

Alligators have been so much hunted for their hides that their numbers have greatly decreased.

Alligator Pear. Fruit of *Persea gratissima*, a tree of tropical America and the West Indies,

Alligator pear, or Avocado pear

belonging to the order Lauraceae. It is also known as Avocado pear. It is a pear-shaped berry, externally brownish or purple, and filled with an oily pulp-like butter or marrow, which is highly esteemed when eaten with limejuice, spice, or pepper and salt. Valuable oil may be expressed from the pulp.

Allighan Case. For the proceedings of a British parl. committee of privileges appointed 1947, concerning the M.P. for Gravesend, see N.V.

Allingham, WILLIAM (1824–89). British poet. Born at Ballyshannon, Donegal, of an English family, he was engaged in the Customs, first in England and then in Ireland. He retired in 1870, and in 1874 became editor of Fraser's Magazine. He was intimate with the pre-Raphaelite group, and his second volume of poems, *The Music Master*, 1855, a

Alligator of the rivers of the southern states of North America, a reptile which sometimes attains a length of 16 ft. Gambier Bolton, F.Z.S.

revised edition of *Day and Night Songs*, 1854, was illustrated by woodcuts from designs by Rossetti, Millais, and Arthur Hughes. Of his other poems, Laurence Bloomfield in Ireland, 1864, and Irish Songs and Poems, 1887, are notable.

William Allingham,
British poet

He married in 1874 Helen Paterson (1848-1926), who as Mrs. W. Allingham was a well-known water-colour painter. He died Nov. 9, 1889. See *Diary*, ed. H. Allingham and D. Radford, 1907.

Alliteration (Lat. *ad*, to; *litera*, letter). Repetition of the same initial letter in words in close juxtaposition. Alliteration was a structural part of the versification of the Anglo-Saxon, Middle English, and Gothic languages generally, a regular characteristic of Icelandic verse, and was employed by several of the Oriental nations. The general rule for the employment of alliteration in early English poetry is that in each couplet three emphatic words, two in the first line and one in the second, begin with the same letter, the alliteration in the second falling on the first emphatic word, e.g.:

Deth cam drivynge after,
And al to dust pashed
Kynges and knyghtes,
Kayseres and popes.

For at least two centuries after it had ceased to be a structural part of English verse, the best writers continued to employ it, Spenser frequently with happy effect, as in his line, "Gay without good is good heart's greatest loathing." Nevertheless when, from having been structural, it became merely ornamental, it was liable to abuse and gradually fell into disfavour. Shakespeare satirised this abuse in *Love's Labour's Lost*, where Holofernes says: "I will something affect the letter for it argues facility. The praiseful princess pierced and pricked a pretty pleasing pricket."

In classical poetry alliteration makes only a slight appearance. Cicero collected some specimens from the early Roman poets, Ennius and Accius, but it appears to have been regarded as a blemish. The structure of Latin, however, facilitates alliteration, and after the revival of literature it found its way into the humorous Latin verse of the 16th century. One famous instance is the *Pugna Porcorum*,

or *Battle of the Pigs*, a poem of several hundred verses in which every word begins with the letter *p*.

In English prose, alliteration was brought to the highest point of mechanical perfection by John Lyly, whose novel *Euphues* gave the name to the literary form Euphuism. Lyly employed it as a structural part of prose, but his imitators, finding the trick an easy one, carried it to extremes, and overlaid their work with an excess of meretricious ornament. During the 17th century it gradually disappeared, and its former existence as a structural part of versification seems to have been forgotten so completely that Waller was credited by one critic with an invention which he only re-introduced. The revival of alliteration may be said to be due to Dryden, since whose day it has been used with supreme skill and subtle effect by such masters of technique as Tennyson and Swinburne.

Alloa. Municipal and police burgh and seaport of Clackmannanshire, Scotland. On the N. bank of the Forth, 32 m. W.N.W. of Edinburgh, it is served by two main lines of the Scottish region of British Rlys. (the river being crossed by a long bridge). Its buildings include a town hall, county and municipal offices, and a parish church, and it has yarn, brewing, distilling, glass, and

Alloa arms

hosiery industries. There is a small harbour with ferry service to South Alloa and its timber yards. Close

Alloa, Scotland: the old church
Valentine

by are the earl of Mar and Kellie's seat, Alloa Park, and Alloa Tower (98 ft. high), the ancient residence of the earls of Mar. Market day, Sat. Pop. 18,244.

Allobroges. Celtic tribe formerly inhabiting S.W. France and the adjacent parts of Switzerland. Their home was between the Rhône and the Isère, where now the cities of Vienne, Grenoble, and Geneva stand. The Romans crushed them in 121 B.C. but they were troublesome vassals.

Allocution (Lat. *ad*, to; *loqui*, to speak). Term used by the Vatican for any important pronouncement by the Pope to the cardinals assembled in a consistory. These allocutions are afterwards usually affixed to the doors of S. Peter's. The address read by a candidate on his admission to the French academy is also called an allocution. See *Consistory*.

Allon, HENRY (1818-92). British Congregational divine. Born at Walton, near Hull, Oct. 13, 1818, and apprenticed to a builder, he joined the Congregationalists. Displaying marked gifts as a preacher, he became a student at Cheshunt College, whence in 1844 he was called to be assistant minister at Union Chapel, Islington, of which he was sole pastor from Feb., 1852, until his death, April 16, 1892. Twice president of the Congregational Union, he edited the *British Quarterly Review*, the *Congregational Psalmist*, and the *New Congregational Hymn-Book*.

Allopathy (Greek *allos*, other; *pathos*, feeling). Medical term for the method of treating diseases by creating a condition different from the symptoms of the disease to be cured, the converse of homoeopathy. The word was first used in the early 19th century by the homoeopaths, the adherents of the new school of medicine invented by Samuel Hahnemann, to denote the traditional school.

Allori, ANGELO (1502-72). Florentine painter and poet. Born at Monticelli, he assisted Jacopo Carucci da Pontormo in the decoration of the church of San Lorenzo in Florence. He painted in fresco and oils, forming his style to some extent on that of Michelangelo. He painted the portraits of Dante, Petrarch, and Boccaccio. He was known, owing to the colour of his complexion, as *Il Bronzino*, or the sun-burnt. His nephew, Alessandro Allori (1535-1607), and his grand-nephew, Cristoforo Allori (1577-1621), were also painters, the latter's Judith with the Head of Holofernes being well known.

Allotment. In company law, the act of formally assigning newly created capital—e.g. shares or debentures—to applicants. By English law previous to 1900 the promoters of a company could go to allotment, however little capital had been applied for; but in 1900 the Companies Act was strengthened to prevent the scandals often arising from this procedure. In public issues now, so much of the desired capital, such amount to be named in the prospectus, must be applied for, or the allotment cannot take place and the money sent on application must be returned within forty days. A letter of allotment constitutes a contract; it is the final stage in the process of which the application is the first, and cannot be repudiated. It must bear a duty stamp; twopence if the nominal value of the shares allotted is less than £5, and one shilling if £5 or more. See Company Law.

Allotments. Small plots of land chiefly used for the cultivation of vegetables. The definition usually accepted is that laid down in the Allotments Act, 1922: "Any parcel of land, whether attached to a cottage or not, of not more than 2 acres in extent, held by a tenant under a landlord and cultivated as a farm or a garden, or partly as a garden and partly as a farm." The Allotments Act, 1925, enabled local authorities to let allotments up to 5 acres in extent. But these are more like small holdings. They are few in number and are mainly confined to the more rural counties.

Usually what is meant by an allotment is an "allotment garden." This parcel of land is defined by the Act of 1922 as "an allotment not exceeding 40 poles ($\frac{1}{4}$ of an acre) in extent which is wholly or mainly cultivated by the occupier for the production of vegetable and fruit crops for consumption by himself or his family." This popular type of plot exists in large numbers in all parts of the United Kingdom. The date of origin cannot be determined with certainty. It is known that experiments in their use were tried out, with considerable success, as a means of relieving prevailing distress amongst poor people nearly 200 years ago. Parliament evidently appreciated their value even in those early days, for many of the Poor Laws passed during that time make provision for the use of land for allotments. The earliest instance of allotments being pro-

vided under an Enclosure Act was in 1806 when 8 acres of land were allotted for this purpose. The first Allotments Act proper was placed on the Statute Book in 1831.

Before the First Great War the number of allotments was very small and the movement mainly a rural one. But the urgent war-time need for augmenting the nation's food supplies stimulated development in towns and cities, and its aspect rapidly changed from rural to urban. The peak year was reached in 1920 when $1\frac{1}{2}$ million plots were being cultivated, largely stimulated by Cultivation of Lands Orders. When these Orders were withdrawn and large tracts of land

to produce the maximum quantity of vegetable food. It is estimated that the united efforts of these small producers succeeded in raising during the Second Great War at least 100 million pounds' worth of food to supplement the nation's larder. In addition to the existing allotments many new ones were laid out in every kind of available site—in public parks and recreation grounds, on commons, on land surrounding R.A.F. stations and army camps and gun-sites, and even in many of London's residential squares.

Well planned, and properly cultivated, a small allotment garden of 10 rods (a little over 300 sq. yds.) will provide enough

vegetable food to supply a small family for nearly a whole year. Local authorities are under a statutory obligation to provide allotment gardens up to $\frac{1}{4}$ of an acre on the application of 6 registered parliamentary electors or ratepayers resident in their districts. A large proportion of allotments under cultivation in 1945 were occupied only temporarily, but efforts were being made in most places to alter this. Many local authorities began to make provision for permanent allotments in their post-war planning schemes, as they looked upon them not only as a

Allotments. Scheme based on one devised by the ministry of Agriculture for the profitable cultivation over three years of a plot 30 yards long by 10 yards wide

had to be surrendered, numbers began rapidly to decline.

At the outbreak of the Second Great War they had shrunk far below the million mark. An intensive "Dig for Victory" campaign conducted by the ministry of Agriculture and Fisheries and supported by the National Allotments Society and other interested bodies, succeeded in restoring the position to the 1920 peak figure. Between the two wars about four million new houses had been built, many of them with large gardens, and the occupiers were now urged to combine with the allotment holders in an effort

means of augmenting the nation's food supplies, but also as being of great social and recreational value. Some local authorities decided to lay out their post-war allotments in such a way as to make an important contribution to local amenities, a policy which was encouraged by town planners.

The lines along which the development of allotments should proceed were indicated in a recommendation made in the Lord Justice Scott Report on land utilisation in rural areas, 1942, para. 202: "As far as possible tracts of good soil in the neighbourhood of towns and villages

shall be kept for the dual purpose of open spaces and market gardens and allotments, and accordingly allotment holders shall have security of tenure instead of the liability of being displaced by housing development."

G. W. Giles

Allotropy (Gr. *allos*, other; *tropos*, turn). Term denoting the property in certain chemical elements of existing in different solid forms. The differences may be in density, colour, crystalline form or other properties. Thus, carbon exists in three allotropic varieties, two crystalline (diamond and graphite, of different densities) and one amorphous, charcoal. Charcoal is not a pure element as it contains a little hydrogen, probably adsorbed. Its carbon content seems to be similar in structure to graphite.

Graphite is soft and its structure consists of parallel layers of hexagonal plates with carbon atoms at the corners of each hexagon. The separation of the molecular layers accounts for the softness of graphite and its tendency to flake. Graphite has a density of about 2.5; diamond about 3.5. The latter is very hard, translucent, colourless or slightly yellow, and its crystals are of the cubic system. In them each carbon atom is surrounded, and attracted, by four other atoms arranged at the angles of a regular tetrahedron. These allotropic differences are due to the differing arrangements of the atoms in the solid substance.

Allotropy occurs in many other elements. There are, for instance, three forms of sulphur (two crystalline, one plastic), two forms of phosphorus (yellow and red), three forms of tin (one ductile in tetragonal crystals, one brittle in rhombic crystals, and a third in powder form). Ordinary tin, if kept at a low temperature, may take the third, or powder, form, and pewter is thus spoiled at prolonged low temperatures by the formation of powdery spots or lumps.

Allowance. English law term used in several senses. (1) In many cases people are liable at law for allowing things to be done. Thus, the highway authority must not allow an obstruction to remain on a highway; the owner of a ship must not allow her to be overloaded; the owner of a horse must not allow it to be worked if it is unfit. In all such cases, the person sought to be held responsible for allowing must be proved to have given his sanction to it, by some

means direct or indirect. *A fortiori* he must know of it, because a man cannot allow a thing of which he has no knowledge. (2) In actions for the redemption of mortgages, the mortgagee is entitled to be paid, under the head of just allowances, all he has spent on or in connexion with mortgaged property, provided that the money has been reasonably or necessarily spent. Allowances always allowed include insurance premiums, and the cost of necessary repairs, but not improvements. Many other expenses may be allowed, even the costs of defending an action in which plaintiff attacked the title to the property. (3) The term just allowances is used in many other Chancery suits where accounts have to be taken, e.g. administration actions, partnership actions, and the like.

Allowances. Literally anything allowed, but the term is most frequently used in a monetary sense. It contains the suggestion of a voluntary payment and one made for no specified services, being thus different from a salary or a pension. Thus we speak of a wife's allowance. The word is used, however, for certain payments which are not voluntary, for instance, those made by the State to the wives, children, and other dependents of soldiers and sailors on active service, known as separation allowances. The reason for this is that they originated in voluntary allowances made by the soldier or sailor. The word is also used for the rebates or concessions allowed to payers of income tax on account of wives, children, and other dependents, or in respect of earned income: there is also a "personal" allowance. *See* Separation Allowances.

Alloway. Village of Ayrshire, Scotland. On the right bank of the Doon, 2½ m. S. of Ayr, it contains the cottage, now a museum, in which Robert Burns was born. The Auld Brig and a new bridge cross the Doon, and a monument stands near the ruined "haunted kirk," the scene of The Witches' Dance in Tam O'Shanter. *See* Burns, Robert.

Alloxan OR MESOXALYLUREA. Substance in the form of white crystals prepared by oxidising uric acid with nitric acid. A weak solution of alloxan is used as a skin "blush," as it has the property of gradually turning pink in contact with the secretion of the skin. A study of the condensation products of alloxan and uric acid first showed the rela-

tionship between uric acid and the alkaloids of coffee and tea.

Alloxantin. Crystalline substance prepared by the action of dilute nitric acid on uric acid. With baryta water a violet-blue precipitate is obtained, the colour disappearing on boiling. These reactions are used as delicate and characteristic tests for uric acid.

Alloy. Term derived from the Latin *ad* to, and *ligare*, to bind, applied (1) to the artificial compound formed by the mixing of two or more metals, usually in a state of fusion; and (2) to a base or inferior metal when mixed with a more valuable one. Brass, a compound of copper and zinc, is an example of the former sense of the word; the copper used in a small proportion with gold in the preparation of the British sovereign, of the latter.

The alloys of metals are numerous, and of great industrial importance and scientific interest. Innumerable as are the metal objects of industrial, domestic, and artistic use, none is pure, while most are deliberately formed mixtures or compounds. Iron, in the cast form, contains an appreciable percentage of carbon, and owes some of its valuable properties to that fact. Steel is iron containing a definite proportion of carbon, and in certain cases small proportions of metals, e.g. nickel, manganese, chromium, vanadium, silicon, tungsten, tellurium, and so on. All the varieties of steel in use, from penknives to armour plate, are varying alloys of iron with carbon or carbon and certain metals. The two metals most generally used in the arts in a state of practical purity are lead and copper. Bronze, one of the earliest forms of metals used by prehistoric man, is an alloy. The Chinese attained great skill in the art of alloying metals at a very remote period.

We have alloys in every condition, from a true chemical compound to a loose mechanical mixture, many appearing to be solidified solutions of one metal in another. The influence of mass in the formation of alloys, a question raised by Bergman and Berthollet early in the 19th century, is possibly greater than has been appreciated. The presence of a thousandth part of bismuth in copper would make a copper cable unsuitable for electrical use, while the presence of a two-thousandth part of bismuth in gold would reduce its tensile strength from about 7 tons

to the sq. in. to $\frac{1}{2}$ ton. Equally small additions and variations in iron will entirely change the physical properties of that metal. The question whether the action of such a minute quantity of metal in masses of others is chemical or physical is very difficult to determine. There appears to be no doubt that the action, perhaps in most cases, is allotropic.

For practical purposes an alloy may be regarded as a new metal. It will be found to have the characteristic properties of metals, e.g. metallic lustre, malleability, tenacity, ductility, and conductivity of both heat and electricity. Its physical properties, however, may differ widely in degree from those of the metals composing it. Where lead, tin, or zinc are among the principal constituents of an alloy, those metals will impart to the alloy their physical properties in proportion to their relative amounts, while the electrical conductivity of the alloy will be proportionate to the relative volumes of the component metals. Generally, the specific heat of alloys will be the mean of those of the component metals.

Greater Tensile Strength

On the other hand, the melting point of an alloy is lower than the mean of those of its constituents, and sometimes lower than that of the most fusible of the components. The specific gravity is scarcely ever the mean, while the tensile strength is generally greater, sometimes much greater. Thus, if pure gold, which has a tensile strength of about seven tons to the sq. in., be alloyed with 10 p.c. of copper its tensile strength will be raised to 18 tons per sq. in., which is much higher than any calculation of the mean strengths of the two metals could give. The alloy is also usually harder than any of the principal metals composing it. The metal platinum is insoluble in nitric acid, but an alloy of platinum and silver is completely dissolved.

The most important alloys are the alloy steels, containing nickel, chromium, tungsten, and other metals in addition to carbon; the copper alloys such as brass (containing zinc) and bronze (containing tin); and the light alloys based upon aluminium and magnesium with up to about 10 p.c. of added metals, chiefly copper, zinc, nickel, silicon, and magnesium (Al. alloys) or aluminium (Mg. alloys). The demands of the aircraft industry for structural

materials to give the highest possible strength/weight ratio have led to the development of alloys with specific gravities below 3 and with tensile strengths up to 40 tons per sq. in. in wrought form. Duralumin was the first of this class of alloy which depends for its remarkable properties upon some form of heat treatment, commonly known as age-hardening. Where metals of high melting point are involved, it is now common practice to produce alloys in finished form by means of powder metallurgy. In this process the metals in finely divided form are mixed together in the desired proportions and moulded into the finished shape in a steel die under high pressure. The articles thus formed are then heated to a temperature just below the fusion point, and "sintered" to form a compact mass by diffusion and recrystallisation. Metals and non-metals can also be bonded together in this way, but such a mixture can hardly be called an alloy.

Practically all the more important alloys used in industry are now covered by B.S.I. specifications which lay down the limits of composition and the

All Saints' Day. Festival of the Christian Church celebrated on Nov. 1 and known formerly in Great Britain as All-Hallows. It originated in A.D. 608, when the Pantheon at Rome was converted to Christian uses, as the Church of the Blessed Virgin and All Martyrs, by Pope Boniface IV, but was not formally instituted until 835. It is a day of obligation for Roman Catholics, and is ordered to be observed in the Church of England. Many superstitions, dating from the pagan festival of Nov. 1, are connected in Scotland with Hallow-e'en, the vigil of All Saints'. In the Greek Church a similar festival is observed on the Sunday after Easter.

Allsopp. Name of a family of Burton brewers. The founder of the business of Samuel Allsopp & Sons was Samuel Allsopp (d. 1838). His son Henry made it one of the greatest concerns of the kind in England. M.P. for Worcestershire from 1874 to 1880, Henry Allsopp was made a baronet in 1880, and in 1886 a peer as Baron Hindlip. He died April 3, 1887.

All Souls College. Oxford college, unique because it consists almost wholly of fellows, having only four undergraduates. Founded

All Souls College, Oxford, founded in 1438, in memory of Agincourt, and styled the College of the Souls of all the faithful departed

Frith

properties, while the more recently developed alloys, particularly the light alloys, are covered by D.T.D. specifications (issued periodically by the ministry of Supply), which also lay down heat treatment procedure and methods of test. Although most alloys are normally produced by melting together the metals of which they are composed, some alloys are produced by direct simultaneous reduction from their mixed ores or from an ore which contains them both. Monel metal is a typical example of the latter.

in 1438 by Henry Chichele, archbishop of Canterbury, its forty to fifty fellows include many men of great distinction. Some of them are chosen after examination; others are the holders of university professorships; while others are elected for special reasons or attainments. The head is called the warden, and the four undergraduates are known as bible clerks. The entrance is in Catte Street.

All Souls' Day. In the Roman Catholic Church, day set apart as one of prayer for the souls of all

Allusive Arms. Left to right: Thomas Beckynton, T. with fire beacon in tun; Montacute, sharp mountain peaks; Plantagenet, broom plant (*Planta genista*); Botreux, Cornish family, a botru in Cornish dialect meaning a toad; Dauphin (dolphin), medieval; De Lucy, three lances (pike); Abbot Robert Kirton, church (kirk) on tun, with pastoral staff and R

the faithful departed. It is observed on Nov. 2, and originated in the abbey of Cluny, A.D. 998. Omitted from the English Prayer Book at the Reformation, its restoration was asked for in 1919 by the lower house of Convocation. In France and Italy the day is known as Day of the Dead.

Allspice. Pea-like berries of *Pimenta officinalis*, a tropical American shrub of the family Myrtaceae. It is cultivated in the W. Indies and Jamaica. The name allspice is due to its fragrance and taste being supposed to combine those of cinnamon, cloves, and nutmeg. It is also known as Jamaica pepper. The berries are picked unripe and dried in the sun.

Allston, WASHINGTON (1779-1843). American painter and author. Born at Waccamaw, S. Carolina, Nov. 5, 1779, he was educated at Harvard and studied in London and Rome. In 1814 his big canvas, *The Dead Man Revived by Touching Elisha's Bones*, was awarded a premium of 200 gs. by the British Institution. His powers were well displayed in Spalatro's Vision of the Bloody Hand, Saul and the Witch of Endor, and the unfinished Belshazzar's Feast. He was elected an A.R.A. in 1818, and returned to America the same year. He was also the author of *The Sylphs of the Seasons with Other Poems*, 1813, and a romance of Italian life called *Monaldi*, 1841. He died at Cambridge, Mass., July 9, 1843. See *Life*, J. B. Flagg, 1893.

All's Well That Ends Well. Romantic comedy by Shakespeare. Helena, the daughter of a physician, after curing the king of France of an illness deemed incurable, is rewarded by the hand of Bertram, count of Rousillon. Assured by Bertram that he will never acknowledge her as his wife until she can show him a ring which he wears, she contrives, by taking the place at an assignation of another lady to whom he has given the ring, to secure both it and him. The scenes are laid partly in France and partly in Tuscany. Comic relief is furnished by Parolles and by a clown of the household of the count's mother.

Probably identical with Love's Labour Won, mentioned in Francis

Meres' *Palladis Tamia*, 1598, and written about 1595-1601, the play was first printed in the 1623 folio. In five acts, it is based on Boccaccio's *Giletta of Narbona* (*Decameron*, Day III, Novel 9), a version of which appeared in William Painter's *Palace of Pleasure*. 2nd issue 1567. The action covers 11 days, spread over a period of three months. The play contains 2,981 lines, of which 1,453 are prose, 1,234 blank verse, and there are 280 pentametric rhymes. It has never been popular on the stage. At Drury Lane, Dec. 12, 1793, J. P. Kemble played Bertram; King, Parolles; and Mrs. Jordan, Helena. An Italian play by Bernardo Accolti, based on the same story, was printed in Florence in 1513.

All The Year Round. Weekly journal started by Charles Dickens, April 30, 1859. With No. 5 *Household Words* was incorporated. Dickens's *A Tale of Two Cities* and *Great Expectations*, Wilkie Collins's *The Woman in White*, No Name, and *The Moonstone*, Charles Reade's *Hard Cash*, Bulwer Lytton's *A Strange Story*, and Mrs. Gaskell's *A Dark Night's Work* appeared first in this periodical. Dickens bequeathed his share and interest in it to his eldest son, who con-

ducted it until April, 1895. It was then absorbed in a new paper bearing the old title of *Household Words*. The Christmas Stories from *All The Year Round* were issued in volume form in 1879.

Allusive Arms. In heraldry, arms, known as *armes parlantes*, canting arms and punning arms, having charges with names suggesting, or alluding to, the name or title and sometimes the office or profession of the bearer. Numerous celebrated examples are connected with territorial insignia, e.g. the castles and lions of the kingdom of Castile and Leon, the ox crossing a ford on the shield of the city of Oxford, the embowered and embattled fess (a bridge) over blue water on the shield of Cambridge, and the ox in the arms of Turin (Torino, *toro*, bull).

Among personal arms may be cited the old shields of the Troutbecks, adorned with a wreath of trout; of the Lucys, displaying three pikes (known of old as *lucres*); of the Trusbuts, barons of Wartre, bearing "trois boutz d'eau," three water-bougets (or water skins); and the barbel on the shields of the counts of Bar. Elephants are seen on the shield of the Oliphants, wolves on those of Wolf and Wolsey, pears and cherries on those

All's Well That Ends Well. An artist's rendering of the dramatic moment when Helena says, "There is your ring, and, look you, here's your letter"

Painting by Francis Wheatley, R.A.

of the Pearys and Cherrys, strawberry flowers (traises) on that of the Frasers, while some of the Baines made use of crossed thigh bones.

Alluvion (Lat *ad*, to; *here*, to wash). Term used to describe additions to land bordering on the sea or a river caused by the imperceptible silting up of the soil. If the accretion is sudden, it is called dereliction. In the case of alluvion, the increase belongs to the lord of the land to which the alluvion attaches, but not in dereliction, *e.g.* where the sea, or a tidal river, suddenly recedes.

Alluvium. Matter derived from the natural waste of rocks. It is carried by running water and deposited where the flow of water becomes insufficient to support the load. Alluvium will be deposited on the convex banks of meandering streams, at the point where a river enters a larger sheet of water, such as a sea or lake, and also over areas adjacent to rivers liable to floods. Marine alluvium is deposited on coastal platforms forming beaches, and on tidal flats forming salt-marshes.

Allyl. Organic radical. Allyl sulphide is known as oil of garlic. Oil of mustard is allyl isothiocyanate; the "mustard gas" employed by the Germans in gas shells during the First Great War was dichloroethyl sulphide.

Alma. River of Russia, in the Crimea. Its length is about 45 m., and it enters the Black Sea 18 m. N. of Sevastopol.

Alma, BATTLE OF THE. First pitched battle of the Crimean War, fought Sept. 20, 1854. On one side were 35,000 Russians under

Prince Menshikoff, and on the other 30,000 French under Marshal St. Arnaud, 25,000 British under Lord Raglan, and a few thousand Turks.

Having landed without hindrance on the Crimean Peninsula, the Allies set out for Sevastopol, some 20 m. away. To stop them the Russian army was drawn up on and behind the hills across the little river Alma, these being most precipitous at the right or seaward end. The plan was for the British and some of the French to advance against the Russian front, while the rest of the French with the Turks climbed the hills near the sea and turned the enemy's flank, this attack being supported by the fire of the warships, and being made along routes which the Russians thought impassable, at least to guns. The British divisions moved forward in line—riflemen in front, guns and cavalry on the exposed flank. Preceded by chasseurs, the French advanced in column, and a halt was called to give the flanking party time to get into position.

By this time the Allies were near enough to suffer many casualties from the Russian guns. Soon the advance was resumed. The unexpected appearance of the French on their flank alarmed the Russians, while other French divisions were moved away to the right to push home this advantage. Two British divisions, the Fusilier and the Light, therefore went forward alone against the Russian centre. They crossed the Alma without serious difficulty, and then the real struggle began. Under

heavy fire they pushed on past the burning village of Burluk, and some way up on the hill five battalions of Fusiliers seized a redoubt, from which after some desperate fighting the Russians hurriedly withdrew their guns. Before the supporting divisions, Guards and Highlanders, could get near, the Russians bore down on the five battalions, among whom a mistaken order to retire caused much confusion. This, however, was obeyed, but happily the reverse did not extend to the division on the left, which cleared the enemy from the hillsides. Falling back, the Fusiliers crashed into the Scots Fusilier Guards, who were thrown into disorder. But the other battalions marched on steadily; their fire told upon the enemy's columns; the French, after some delay caused by the congestion of men and guns on narrow hill-tracks, were moving forward; and the Russians soon began to withdraw. There was no real pursuit, but the Allies were in possession of the heights and could consequently claim to have won the day. The British losses were about 3,000 killed and wounded, largely incurred during the struggle for the redoubt. The French had about 1,400 and the Russians perhaps 6,000 killed or wounded. See The Invasion of the Crimea, A. W. Kinglake, 1863-87.

Alma Ata. Capital of Kazakh S.S.R., situated at the foot of the N. slopes of the Ala-tau mts. It is a university city, a commercial centre, and an important station on the Turkestan-Siberia rly. Pop. 230,528.

Alma. Battle of Sept. 20, 1854, when British and French troops attacked and defeated the Russians, who held the heights above the river, to bar the advance on Sevastopol. The mouth of the Alma is seen on the right

Alma. The charge of the British Guards on the heights above the river, a critical moment in this Crimean battle. After a painting by J. Huard based on a sketch made on the spot by an English officer. See page 322

Almack's. Name of a Whig gaming club in Pall Mall, and of assembly rooms in King Street, St. James's, London, W. The original Almack's Club was founded in 1764, and was formed by William Almack or McCall (d. 1781), sometime valet to the 7th duke of Hamilton, and keeper of the Thatched House tavern in St. James's Street. Later known as Goosetree's and then as Brooke's, it removed in 1778 to No. 60, St. James's Street. The present Almack's Club is at 3, Savile Row, W.1; it was founded in 1903 at 20, Berkeley Street, as a social club. Almack's Assembly Rooms, built in King Street for Almack by R. Mylne, were opened Feb. 20, 1765. The subscription of 10 gs. provided a ball and supper once a week for twelve weeks. The rooms quickly became an exclusive centre of fashion, and so remained until about 1863. The balls were controlled by a committee of titled ladies, among whom, early in the 19th century, Lady Jersey was prominent. The rooms were later known as Willis's Rooms, and then for a time as Willis's Restaurant.

Alma-Dagh. Mt. range on the N.W. border of Syria. The ancient Amanus, and known also as the Akma and Ekma Dagh, it extends from near Alexandretta in a N.E. direction about 160 m.

Almaden. Town of Spain, in Ciudad Real prov. It received its name (Arab. word for "the mine") from the deposits of quicksilver ore mined there for

many centuries, largely by convicts. About 270 years ago Juan Bustamente invented a process for the recovery of quicksilver long known as the Almaden process. In the autumn of 1938, Nationalist troops of the Estremadura front captured the town and mine, after a long defence by Republican government forces. Pop. 10,000.

Almagest (Arab. *a'*, the; Gr. *megistē*, greatest). Name given by the Arabs to Ptolemy's great work on astronomy. It was written about A.D. 140 and translated into Arabic about A.D. 800. This comprehensive treatise covered the whole subject of astronomy, treated from the geocentric standpoint, and its authority was unchallenged until the 16th century, when Copernicus put forward his heliocentric theory. It included a catalogue of stars, which was a revision of the older catalogue of

Hipparchus; this catalogue contained 48 constellations out of the 88 now generally recognized, and classified the stars by magnitudes.

Almagro, Diego d' (c. 1473-1538). Spanish leader in the conquest of S. America. Born at Áldea del Rey, New Castile, he was associated with Pizarro in the conquest of Peru, but quarrelled with him on the question of the division of territory. A battle took place between their adherents near Cuzco in 1538, in which Almagro's army was defeated, and he was strangled in prison by Pizarro's order.

Alma Mater. Latin for kind mother. The phrase is often used for the university or college where a man or woman has been educated, and for which he or she retains a kindly affection. As the natural mother nourishes the child, so the college, the intellectual mother, nourishes the student.

Almack's. Ball at the famous London assembly rooms in King Street, St. James's, in 1798. The assembly rooms formed for many years a place notable for its exclusive social gatherings

Al-Mamun OR **ABDALLAH** (c.786-833). The seventh caliph of Bagdad. The second son of the caliph Haroun-al-Raschid, he was proclaimed caliph in 813, after serving as governor of Khorassan. A patron of letters and science, he made Bagdad a seat of learning, and died near Tarsus in Asia Minor.

Almanac. Year-book or table indicating the days of the week according to the months, together with astronomical, meteorological, and other data of value. The word almanac, thought to be of Spanish-Arabic origin, was used by Roger Bacon in his *Opus Majus* in 1268 and by Chaucer in *On the Use of the Astro-labe* in 1391. Sometimes called Ephemerides or Prognostications, the early printed almanacs were concerned with predictions, and among such were those of Leonard Digges, William Lilly, John Partridge, satirised by Swift, and Francis Moore. In Great Britain from 1710-1834 they were subject to a stamp duty.

Modern almanacs date from the starting by Charles Knight of *The British Almanac and Companion* in 1828, and the best contain a vast amount of miscellaneous information. The most noteworthy existing almanacs include *The Nautical Almanac*, Whitaker's, Hazell's, Oliver and Boyd's, Thom's *Irish Almanac*, *The Almanac y Miloedd*, *Almanach de Gotha*, *Almanach Hachette*, *Connaissance de Temps*, *Berliner Astronomisches Jahrbuch*, and the *American Ephemeris and Nautical Almanac*. The prophetic almanacs survive in Old Moore's, Zadkiel's, and Raphael's.

Clog or log almanacs were oblong sticks of wood, brass, bone, or horn, with notches for the days of three months of the year on each of the four edges. They were flanked left and right with symbols indicating the lunar cycle, saints' days, etc., and made to hang on wall or mantelpiece or carry in the pocket. Supposedly of Scandinavian origin, they were still in use in the N. of England when, in 1886, Dr. Plot described them in his *Natural History of Staffordshire*.

Almanac,
old clog forms

Almanach de Gotha. International book of reference issued in French and German. Established in 1763, it is published by the firm of Justus Perthes at Gotha, hence the name. It is in two main divisions, the first being devoted to the royal and noble families of Europe, while the second resembles *The Statesman's Year-Book*. In the first part the great families of Europe are divided into three classes: (1) reigning houses; (2) houses of Germany, formerly princes of the Holy Roman Empire; (3) other princely and ducal houses, including "the ducal houses of France, Belgium, Great Britain and Ireland, and many of the princely houses of Spain, Italy, and Russia." The second part contains statistics and names of the chief officials of all the countries of the world arranged in alphabetical order. In the John Rylands library, Manchester, there is a complete set of the German edition of the *Almanach* from 1764. It includes two copies for 1808, one suppressed by Napoleon and the other revised according to his directions. In 1945 the *Almanach* failed to appear for the first time for 181 years.

Almandine. Deep-red variety of the garnet, often having a violet tinge. Formerly known as the carbuncle, it is now called the precious or noble garnet. Good almandines closely resemble rubies, but are less hard, have a higher specific gravity (4.1 to 4.3), exhibit single refraction and no dichroism, and show the same colour in whatever light they are viewed. Almandine and zircon are the only precious stones exhibiting dark absorption bands in the spectrum. With almandine the dark bands appear in the green part, a phenomenon which can be observed by the help of a pocket spectroscope. Almandine spinels are red spinels with a blue or violet hue. These stones are found chiefly in Ceylon, Brazil, Tirol, the U.S.A., and Greenland. The word comes from Alabanda, a city of Caria in Asia Minor. See Garnet.

Almansa OR **ALMANZA.** Town of Spain, in Albacete province. It is 60 m. N.W. of Alicante by rly. from that town to Madrid, and has a ruined Moorish castle and an obelisk marking the site of the battle of 1707. Pop. 11,250.

Almansa, BATTLE OF. Fought April 25, 1707, between the English on one side and the French and Spaniards on the other. England was struggling against France, her object being to place

the Archduke Charles, instead of a French prince, on the throne of Spain. To assist him an army was sent to Spain, and the rival armies met at Almansa. The English and their friends were under a Frenchman, Ruvigny, whose English title was earl of Galway; the French and Spaniards were under the duke of Berwick. Ruvigny had with him about 15,000 men, of whom only a third were British, the rest being Portuguese, German, and Dutch; Berwick had about 25,000.

Berwick took up a position on some rising ground, with infantry in the centre and cavalry on the wings, and Galway, after a march of eight miles, came up to attack him. This first charge was successful, and the English regiments, horse and foot, drove the Spaniards from the field; but the French meanwhile attacked their right and soon overwhelmed the Portuguese battalions. Then the victors turned against the English, Dutch, and Germans, who, although outnumbered, fought desperately. Their position, however, proved hopeless, and after a time Galway managed to withdraw most of his men and save his guns. The British and their allies had about 4,000 killed and wounded, and lost 3,000 prisoners.

Almansur (c. 710-75). Sur-name, meaning the Victorious, of the second Abbasside caliph Abu Ja'far, the founder of Bagdad. He succeeded his brother Abul Abbas in 754, and his reign was marked by the loss of Spain and Africa and by the oppression of Christians in Syria and Egypt. For security against attack he left his old residence near Kufa and built (763-6) a new capital on the site of the old town of Bagdad. He died while on pilgrimage to Mecca.

Almas, MOUNT. Commanding height in Transylvania, near the Bekaz Pass. It was occupied by the Russians, Nov. 11, 1916, in their invasion of Transylvania to aid the Rumanians.

Alma-Tadema, SIR LAURENCE (1836-1912). Anglo-Dutch painter. Born at Dronrijp, Friesland, Jan. 8, 1836, he studied at the Antwerp Academy, then under the direction of Baron Wappers. Success attended him from the first.

In 1863 the Grosvenor Gallery organized a representative exhibition

Sir Laurence Alma-Tadema, painter
R. Haines

of his work, in 1870 he made his home in England, and in 1873 he was naturalised. Elected A.R.A. in 1873 and R.A. in 1879, he was knighted in 1899, and received the Order of Merit in 1905. He died at Wiesbaden, June 25, 1912.

Alma-Tadema devoted special study to the life and customs of the Greeks and Romans, and his most popular pictures recreated the period with great care for accuracy of detail, e.g. *The Roses of Heliogabalus*, 1888, one of his largest canvases; *The Colosseum*, 1896; and *The Conversion of Paula*, 1898.

Almeh OR **ALMAH** (Arab. *alama*, to know). Name given in Egypt to a member of a superior class of

professional women musicians, in allusion to the fact that they have spent years in rigorous training and know their duties. Almehs are usually singers only, but sometimes are instrumentalists. Other forms of the name are *alme* and *alma*, the strict plural form being *awalim*.

Almeida. Town of Portugal, in Guarda district. It stands on the river Coa, near the Spanish frontier, and was taken by the Spaniards in 1762 and the French in 1810. The fortifications, destroyed by the French in 1811, were restored by the British.

Almeida, DOM FRANCISCO D' (c. 1450-1510). Portuguese seaman. After serving against the Moors, he was appointed in 1505 the first viceroy of Portuguese India. He founded new trading posts in Cochín, Ceylon, and Sumatra. To avenge the death of his son Lorenzo, killed in a conflict with the Egyptians, Almeida burned and looted Goa and other ports, and in Feb., 1509, annihilated the Egyptian fleet off Diu. Superseded by Albuquerque, he sailed for Portugal, but was killed by savages, March 1, 1510, on the site of the modern Cape Town.

Almeida-Garrett, JOÃO BAPTISTA DA SILVA LEITÃO, VISCOUNT DE (1799-1854). Portuguese dramatist and statesman. Born at Oporto, he was educated at the university of Coimbra. His attach-

Alma-Tadema. A Silent Greeting, typical of the classical subjects chosen by this painter
Tate Gallery, Millbank

ment to Liberal principles forced him to spend some years in exile, but in 1832, under a new king, he was appointed minister of the interior. He carried through many reforms in the Cortes, represented his country at Brussels, and for some months was minister for foreign affairs. He contributed to the foundation of a national theatre and wrote a series of prose dramas, the most important of which are *Auto de Gil-Vicente*, 1838; *D. Filippa de Vilhena*, 1840; and *Frei Luiz de Sousa*, 1843. He died Dec. 9, 1854.

Almeria. Prov. of S.E. Spain. Formerly part of Granada, it has an area of 3,360 sq. m., is well watered, rich in minerals, especially lead and sulphur, yields wine, olives, and fruit, especially white grapes, and is celebrated for its cattle. Pop. 368,292.

Almeria. City and seaport of Spain. The capital of Almeria province and one of the chief Mediterranean ports, it is 60 m. S.E. of Granada, on the rly. to Madrid, and has a wireless station. Beautifully situated on the Gulf of Almeria, which extends from Cabo de Gata to Punta de Elena, the city is a winter health resort, with a fine harbour, a four-towered Moorish castle, and a late Gothic cathedral. It exports the noted Almeria white grapes and other fruits, esparto, and iron ore. Founded by the Phoenicians, it was

finally taken from the Moors in 1489. Pop. 84,901.

During the greater part of the Spanish civil war, 1936-39, Almeria was held by Government forces. When the British government protested in July, 1938, against the bombing of British ships in Spanish harbours by Nationalist planes, Gen. Franco proposed that the port of Almeria be kept for non-military traffic. This suggestion was rejected.

Almirante. Seaport on the N. coast of Panama. It stands on Almirante Bay, an arm of the Chiriquí lagoon, about 40 m. E. of the Costa Rica boundary. It is the terminus of a rly. from Port Limón in Costa Rica. Bananas and other fruit are exported.

Almissa (Slav. *Omish*). Seaport of Yugoslavia. On the Adriatic, at the mouth of the Cetina, and 14 m. S.E. of Split, it formed part of the former diminutive republic Poglizza. Wine is produced.

Almohades. Mahomedan sect and dynasty of the 12th and 13th centuries. Its founder was Mohammed ibn Tumart, a Berber by race and an ascetic, who preached a stricter form of the Mahomedan faith. He died in 1123, but his disciple Abd-el-Mumin, a redoubtable warrior who assumed the title of a caliph, conquered a considerable part of N. Africa and in 1149 made himself ruler of Morocco. Later he subdued part of Spain, making Seville his capital. The great blow to the power of the Almohades came in 1212, when Mahomed III was defeated by the Christian kings of Spain. Their possessions in Spain were quickly lost, and soon afterwards those in Africa. Their last representative, Idris IV, was murdered in 1269. The name is a corruption of Arabic *al-muwahhid*, one who declares the unity of God. See Spain: History.

Almon, JOHN (1737-1805). English writer and bookseller, friend of John Wilkes (q.v.). Born in Liverpool, he became a working printer in London, and a writer of political pamphlets. In 1774 he began to issue *The Parliamentary Register*, from his Piccadilly bookshop. In 1784 he became the owner and editor of *The General Advertiser*. In 1786 he was tried for libel, and afterwards, being in financial difficulties, retired for a time to France. He died at Boxmoor, Herts, Dec. 12, 1805.

Almond (Gr. *amygdalē*). Fruit of *Prunus amygdalus*, a small tree of the family Rosaceae, and a native of the Mediterranean

region. It is largely cultivated in S. Europe and the Levant on account of its fruit, and in cooler parts for the sake of its flowers, which appear in advance of the leaves. Closely related to the peach, the fruit of the almond tree lacks the succulent flesh of the former, and the seed (the almond of commerce) is the only edible portion. The fruit consists of a downy leathery husk, which splits when the seed is ripe and exposes the hard, wrinkled stone enclosing the seed. The different kinds sold in the shops—the sweet, the bitter, and the thin-shelled Jordan—are cultivated varieties of the same species. It was introduced into Britain about the middle of the 16th century, and is cultivated as a beautiful spring-flowering tree or shrub, varying from 3 ft. to 12 ft. in height. The flowers are white,

Almond. The fruit of the Jordan almond as it grows; and (on the left) a nut without the leathery husk, and a kernel

pink, and red. The almond flourishes in ordinary garden soil and in open shrubberies and town gardens. It is pruned in winter by removing old branches.

Almond. River of Perthshire, Scotland. It flows 30 m. S.E. to join the Tay some 2 m. above Perth.

Almond Oil. Oil obtained from the seeds of the two varieties of bitter and sweet almonds. These yield a bland sweet oil by expression, and in addition bitter almonds yield on distillation a volatile or essential oil with a distinctive flavour.

To obtain the expressed oil the reddish-brown powder adhering to their surfaces is cleaned from the almonds, which are then ground or well bruised in a mortar or mill, enclosed in canvas bags, and subjected to pressure between polished steel plates which have previously been warmed. The oil which drips

from the bags is at first turbid, but by rest and filtration a clear straw-coloured oil is obtained, free from odour and with a slight nutty taste. The oil is extensively used in medicine. Sweet almonds yield 40 to 54 p.c. of oil, bitter almonds 38 to 45 p.c.

It thus appears more advantageous to employ the sweet almonds for yielding oil, but as the expressed oil has to be removed from bitter almonds before the essential oil is distilled from them, it is usual to submit a mixture of the two kinds of almonds to pressure and then distil the residue for the sake of the essential oil contained in the bitter almonds. The last-named oil is present in bitter almonds to the extent of $\frac{1}{2}$ p.c. The oil as distilled contains a small proportion of hydrocyanic acid, and, being largely used as a flavouring in cookery and confectionery, it is submitted to a process which frees it from this poisonous constituent, usually by redistilling with a mixture of lime and iron sulphate.

Peach kernels are also used for obtaining essential oil of almonds, the product being similar to that yielded by bitter almonds. Nitrobenzene, introduced as a substitute for essential oil of almonds, is used for perfuming soap. It can be distinguished from the natural oil by adding twice its volume of caustic potash; if nitrobenzene is present the mixture turns green.

Almoner (Gr. *eleemosynē*, alms). Official alms-giver. Originally the title of the member of a monastery appointed to dispense the alms, the term came to be applied to a similar functionary in the household of princes and ecclesiastics. The grand almoner of France was a high court official.

The British royal household has an almonry, comprising the hereditary grand almoner, the marquess of Exeter, the lord high almoner, and the sub-almoner. The lord high almoner dispenses the royal alms on Maundy Thursday. At a coronation the hereditary grand almoner scatters the royal largesse in Westminster Abbey while the peers pay homage to the sovereign. The chaplain of a benevolent institution is sometimes designated the almoner, and many hospitals employ almoners, whose duties include the determination of the fees that a patient can be expected to pay for admittance.

Almora. Town and district of India. The town is the capital of the Kumaon division of the United

Provinces and lies 83 m. N. of Bareilly, on a ridge in the Almora hills, 5,494 ft. high. For centuries a native stronghold, it came into British possession in 1815. The district, 5,420 sq. m. in area, produces tea.

Almoravides. Mahomedan sect and dynasty of the 11th and 12th centuries. Converted to Mahomedanism and fired with its religious zeal, a tribe from the Sahara made war successfully upon its neighbours and in the 11th century conquered Morocco. They called themselves the Murabitis or hermits, a name altered in the course of time to Almoravides. Abu Bekr was their early leader, but it was under his kinsman, Yusuf-ibn-Tashfin, that they attained the height of their power. He founded the city of Marrakesh, Morocco, and in 1086 crossed over to Spain and there brought the various Moorish kingdoms under his authority. When he died in 1107, his empire included all Spain and Portugal from the Ebro to the Tagus, considerable territory in N. Africa, and the Balearic Islands. Under his successors much of the European possessions passed to the Almohades, by whom their power in Marrakesh was destroyed. The city of Marrakesh was lost in 1147, a date marking the end of the Almoravides. See Morocco.

Almqvist, KARL JONAS LUDWIG (1793-1866). A Swedish author. Born at Stockholm, at the age of twenty he left a post in the civil service to found a cooperative farm colony, which proved unsuccessful. He took to teaching and to the composition of textbooks, turned author, and achieved fame as a writer of romance. In 1851 he was charged with forgery and murder, and fled to America. Returning to Europe in 1865, he lived under the name of C. Westermann at Bremen, where he died Sept. 26, 1866. His best known work is the group of novels called *The Book of the Thorn-Rose*, 1832-5.

Alms-houses. Homes provided in England by individual philanthropists, city companies and trades for the aged poor. Usually they consist of separate tenements. When on the dissolution of the monasteries the almonies of these institutions disappeared, the foundation of alms-houses became a common form of benevolence, generally under the name of hospitals, a term still used for them in Scotland.

London has many alms-houses, notably the Charterhouse, founded in 1611. Near Winchester is the Hospital of S. Cross, founded

in 1132; at Warwick is the Leicester Hospital, dating from 1571, and at Hereford the Coningsby Hospital, founded 1610. In the U.S.A. the term almshouse is used for buildings similar to the English workhouse, and in many cases connected with farms on which work is found for able-bodied paupers. See Charities of London, Sampson Low, 1850; The Almshouse, A. Johnson, N. Y., 1911.

Almucantar OR **ALMACANTAR** (Arab, sundial). Circles of the celestial sphere. They are parallel to the horizontal plane and cut the meridian at equal distances. They are, therefore, parallels of altitude, and comprise all points of the same altitude. The horizon is the first almucantar. S. Chandler, in 1880, adopted the name for his instrument for determining time and latitude.

Alness, ROBERT MUNRO, 1ST BARON (b. 1868). British lawyer and politician. Born May 28, 1868, he was educated at Edinburgh university. Serving as Liberal M.P. for Wick Burghs, 1910-18, and

for Roxburgh and Selkirk, 1918-22, he became lord advocate, 1913, secretary for Scotland, 1916, and lord justice-clerk, 1922, taking the title Lord Alness, 1922.

Alnwick. Urban district, market town, and the county town of Northumberland, England. On the Aln, 34 m. by rly. N. of Newcastle-upon-Tyne, it has a brewery and a large trade in corn, cattle, and fishing tackle. A fortified town

at an early date, it was frequently besieged by the Scots, e.g. in 1093, when Malcolm, king of the Scots, was killed, and in 1172, when William the Lion was taken prisoner. It retains vestiges of its old walls and one gate, the Bondgate, and has an old church, S. Mary and S. Michael, and S. Leonard's hospital. Market day, Mon. Pop. 7,250. *Pron.* an'-ick.

Alnwick Castle. Seat of the duke of Northumberland, just outside the town of Alnwick, utilised since 1945 as a teachers'

Almshouses. Part of the beautiful Hospital of S. Cross, near Winchester, showing to the right, Cardinal Beaufort's Tower; above, the fine Tudor timbered buildings of Lord Leicester's Hospital at Warwick

Photochrom

training college. It was first built in the 12th century and passed to the Percy family early in the 14th. Of the old castle little remains save a gateway and a Norman arch; the building was restored in the 18th century and added to in the 19th. It contains many fine works of art and is surrounded by a park with ruins of two abbeys and two memorial towers.

Alodial OR **ALLODIAL** (Lat. *allodium*). The name given to a form of land tenure found in England in Anglo-Saxon times and common in Scandinavia. The word *alod* means probably an inheritance, and appears in the English records of the 11th century. Alodial land is practically the same as freehold and opposed to feudal. A man who held land on feudal tenure was obliged to render service for it to the king or other overlord; one whose land was alodial had no such obligation. About the time of the Norman Conquest, as landholders found it necessary to put themselves for protection under overlords, alodial tenure disappeared rapidly, and for centuries it has not been recognised in English law. In Norway and Sweden this tenure, called *odol*, was common in the Middle Ages, and such land could not be alienated. See Land and Land Laws.

Alnwick Castle, Northumberland, seat of the Duke of Northumberland. Though the greater part of the edifice is comparatively modern, there are some remains of the original Norman structure

A.L.O.E. A Lady of England, pseudonym of Charlotte Maria Tucker (*q.v.*), writer of books for children.

Aloe. Extensive genus of the family Liliaceae. It consists of succulent shrubs (rarely trees) with thick, fleshy leaves margined with prickles or teeth. The numerous tubular flowers are sex-partite and arranged in erect racemes. They are plants of hot, dry countries, particularly of S. Africa, their organization being adapted to growth under such conditions, the leathery texture of the skin hindering rapid evaporation of moisture from the leaves. Several species of the plant are of economic importance, the drug aloes being the dried resinous juice from the leaves of *Aloe vera* and *Aloe Socotrina*, that from the former being known as Barbados aloes and the latter as Socotrine aloes.

Aloes. Juice of various species of the aloe, evaporated to dryness. It occurs in commerce in masses of a yellowish-brown colour. The most important constituent is a crystalline principle called aloin. Combined with nux vomica and ferrous sulphate, aloes is often useful in simple anaemia. It is an excellent intestinal purgative in cases of chronic constipation, and is most frequently administered in the form of a pill. Aloes is contained in the compound rhubarb pill, the compound colocynth pill, and the compound pill of colocynth and hyoscyamus.

Aloes Wood, EAGLE WOOD, OR LIGN ALOES. Supposed to be the *agallochum* of the ancients, it is obtained from a large tree, *Aquilaria agallocha*, a native of Sylhet. This yields an abundance of resin and uggur oil, the latter esteemed as a perfume and burnt in Eastern temples to scent the air. The oil is also used in gout and rheumatic affections. There is a Biblical reference to "trees of lign aloes which the Lord hath planted," in Num. xxiv, 6. This version of the name is from the Lat. *lignum*, wood.

Alone in London. Melodrama by Robert Buchanan and Harriet Jay. Produced Nov. 2, 1885, at The Olympic Theatre, London, it had a run of 107 performances.

Along OR HALONG. Bay of the Gulf of Tongking, French Indo-China. It is sheltered by Cao-Ba Island on the S.W.

Alopecia. Medical term for baldness (*q.v.*).

Alost (Flem. *Aalst*). Town of Belgium, in E. Flanders. It stands on the navigable Dender, 19 m. by

Alost. The 13th century Hôtel de Ville of the old Flemish town

ry. W.N.W. of Brussels, and has a magnificent, but unfinished, church, S. Martin's, a 13th century town hall, and a Jesuit college. It has bleaching works and manufactures textiles, leather, beer, and spirits. After heavy fighting at the outset of the First Great War, Alost was occupied by the Germans from Oct., 1914, to Nov., 1918. It was again occupied

Alpaca. South American animal of the camel family, the hair of which is used for making a material of the same name

Gambier Bolton, F Z.S.

by them in their drive W. from Brussels, May, 1940, remaining so until liberated by the British 2nd army, Sept. 4, 1944. Pop. 41,151.

Aloysius (1568-91). Italian saint. Luigi Gonzaga was the son of Ferdinand, marquis of Castiglione, and was born March 9, 1568. Conspicuously devout from earliest boyhood, he resigned his title in 1585, joined the Society of Jesus, taking the name of Aloysius, and died while ministering to the sick during a plague epidemic in Rome, June 21, 1591. He was beatified by Gregory XV in 1621, and canonised by Benedict XIII in 1726. He is a patron saint of schoolboys.

Alpaca. Domesticated breed of the guanaco, a South American animal of the camel family. In its wild state it is found in flocks, ranging from 100 to 500 head, among the mts. of Peru and Ecuador, and as far S. as Tierra del Fuego. Domesticated by the Peruvians in early days, it is bred for its fine, long wool, from which blankets and cloaks (*ponchos*) have been made from time immemorial. These herds feed on the higher lands of Bolivia and S. Peru, and are brought down in the shearing season.

The British trade in alpaca wool dates from 1836, and owes its development to Sir Titus Salt, who manufactured the wool into cloth in his mills at Bradford. The 13th earl of Derby had a herd of alpacas at Knowsley, and hoped to acclimatise the animal for commercial purposes, but was disappointed.

The name is a compound of Arab *al*, the, and *paco*, the Peruvian name of the animal.

The hair of the alpaca is some 7 ins. to 15 ins. in length, brown, grey, and black in colour, with a small proportion of white. The material, originally used as a substitute for mohair, which it resembles, is soft to the touch and of fair lustre. Alpaca goods are usually dyed black. Alpaca dress goods and linings are made with a cotton warp and an alpaca weft.

The best market quality of raw alpaca is that known as Arequipa fleece. Cheaper sorts come from Tacna, Callao, and Chala, Peru.

Alp-Arslan (c. 1029-72). Sur-name, meaning brave lion, of Mohammed ben Daud, second Seljuk sultan of Persia, and nephew of Toghrul Beg. He became ruler of Khorassan in 1059 and sultan of Persia in 1063, and extended his dominions by the invasion of Armenia and Asia Minor. In 1071 he captured the

Greek emperor, Romanus Diogenes, and extracted a large ransom from him, but, invading Turkistan the following year, he was mortally stabbed by a captured chief. His favourite residence was Merv, where he was buried.

Alpena. Chief city of Alpena county, Michigan, U.S.A. It stands on Thunder Bay, a branch of Lake Huron, and is a port with a good harbour, a pleasure resort, and a manufacturing place. Water power is obtained from the river, minerals are found in the neighbourhood, and fishing is carried on. Alpena, first settled in 1835, became a city in 1871. Pop. 12,706.

Alpenhorn OR ALPHORN. The long, curved, wooden bugle used by the Swiss peasants and cow-

Alpenhorn. Instrument used by the Swiss peasants and cowherds

herds to communicate with each other from a distance. It has a conical bore with a mouthpiece of cup shape. Some of these horns are as much as 8 ft. long, but their size, shape, and curvature differ with the locality.

Alpenstock. A long ash pole with a spike at the end used in mountaineering. It has been partly superseded by the ice-axe.

Alpenstock. Mountaineer, with alpenstock, seen during an ascent

Alpes-Maritimes. Frontier department of S.E. France. It is bounded N. and E. by Italy. S.E. by the Mediterranean, and has an area of 1,443 sq. m. Spurs of the Maritime Alps extend to the sea, where the littoral is called the French Riviera. It contains the health resorts of Nice, the capital. Mentone, Cannes, and Antibes, and surrounds Monaco. The mildness of its climate is world-renowned, though in the highlands the cold is extreme. The valleys are beautiful and fertile. It produces wine, oil, tobacco, silk, honey, wax, fruit, and flowers. Perfumery

is made, while there are sardine and anchovy fisheries, and minerals are worked. The department is divided into three arrondissements. Pop. 513,714.

Alpha and Omega. First and last letters of the Greek alphabet. In Rev. 1, 21 and 22 (compare Is. 41 and 44) they symbolise the eternity and perfection of the Deity. Combined with the cross or the monogram of Christ, they were inscribed on tombs of early Christians. The Hebrews used Aleph and Tau, first and last letters of their alphabet, for absolute completeness and perfection

ALPHABET: ITS ORIGIN AND GROWTH

M. A. Canney, Professor of Semitic Languages

This article gives some account of the long and varied history of the alphabet, each English letter of which is, in addition, described separately. See also Writing, Printing, etc., while the articles on Language, Philology, and Hieroglyphics should also be consulted

The word alphabet is formed from *alpha* and *bēta*, the names of the first two letters of the Greek system. It thus indicates the origin of English letters, which is identical with that of the Latin, Coptic, Russian, and other alphabets of modern Europe.

The remarkable variety of alphabets is not confined to the formation of letters, but extends, though in less degree, to the number of letters employed. In the latter case the difference is due to a different development, through climatic or other causes, of the organs of speech. There are distinctions of sound in Arabic, for instance, which it is impossible for most Europeans to reproduce, and these are represented by different letters. Accordingly, certain letters in Hebrew may correspond to two letters or sounds in Arabic. We find, for example, that to suit their alphabets to the sound of their language, while the Hebrews and the Italians use twenty-two letters and the English twenty-six, Arabic employs twenty-eight and Russian thirty-three.

Of other European alphabets, Polish contains 45 letters; French, 25; German, 26; Danish and Norwegian, 27; Spanish, 29; Hungarian, 38; Albanian, 33. The old Maeso-Gothic, in which the translation of the Bible in the 4th century was made by Ulphilas, had 25 letters, and the Runic alphabet characters, early used by the Scandinavian peoples, numbered 24. Among Eastern dialects, Sanskrit, the ancient and literary language of India, which probably came nearest to reproducing the supposed original Indo-European parent language, possessed an

alphabet of 49 letters; Hindustani, 35; Persian, 32; Turkish, 31; Armenian, 38; Ethiopic, 26, with seven additional Amharic letters. Telugu has 35 consonants and 13 vowels, with various combinations; Tibetan, 35; and Japanese, 73.

The above examples of the variation in the number of letters included in the different alphabets, which in many cases are used to express sounds which offer special difficulties to the foreigner, make it easy to understand how unsatisfactory must be any attempt, especially in the case of non-European sounds, adequately to represent the words of a foreign language by means of English characters.

In 1891 Messrs. Gilbert and Rivington printed the Lord's Prayer in 300 languages, comprising the leading languages and their principal dialects throughout the world. Some of the alphabets used are similar, and many more which are known to exist or to have existed are not represented. But this fact gives some indication of the vastness of the field covered by the history of the alphabet and of the wonderful ingenuity with which alphabets have been developed.

Since *alpha* and *bēta* are adaptations of the Semitic names *ʾālf* (Heb. *ʾāleph*) and *βēl* (Heb. *bēth*), the term alphabet seems to carry us back to a Semitic precursor of the Greek system. The square Hebrew characters of the Hebrew Bible are a modified form of Aramaic or Palmyrene characters, and were adopted by the Jews at a comparatively late period in their history. The older Hebrew letters, as seen in the Siloam

Table tracing the derivation of our alphabet from that used by the Phoenicians of 1000 B.C., and traditionally attributed to Cadmus. All writing of earlier date was hieroglyphic or pictographic—i.e. writing by means of picture-drawing, hieroglyphs being the sacred characters of the ancient Egyptian language, the signs representing sounds (phonetic) or ideas (ideographic). The Mediterranean peoples, including the Greeks, used various and complex systems of pictographic, ideographic, and phonetic writing. The names of Semitic letters in the above table are examples. The earliest Greek handwriting, like the Semitic, was from right to left; then came a method in which the direction alternated before the left to right form was adopted. Further developments were made by the Romans, who in the 1st century A.D. produced letters which have served, through the intermediary of early Christian scribes, as models for type down to our own time.

The smaller letters, called minuscule, as distinguished from the majuscule or capital, and known to printers as lower-case, are an evolution from the capitals brought about by the rapid movement of the hand in writing and lettering. The Semitic alphabet has no capitals. The line of descent for letters, as for the arts, in Europe is through Greece, but only one of the important modern languages, Russian, has characters based directly upon the Greek; almost all the alphabets of modern civilization being derived from the Roman. The first type was made about A.D. 1500 fashioned on the script model; and the early Black Letter was the origin of German text or Gothic letters. Before the invention of the first alphabet knowledge was transmitted orally, and symbol- or picture-writing was used for the purpose of assisting the memory; it was employed by the Peruvians, and is used at the present time by the North American Indians.

ALPHABET : HOW OUR LETTERS HAVE EVOLVED FROM PICTURE-WRITING

Table adapted from that issued by the Kalkhoff Co., New York

inscription of the 7th century B.C., bear, in some cases, a close resemblance to the so-called Phoenician letters as seen in the Moabite Stone, c. 840 B.C., and to those of the South Semitic scripts, the Sabæan, the Lihyanite, the Tnamidenic, and the Safaitic. There is a like resemblance between these ancient Semitic scripts and the ancient Greek script. The exact relationship of the South Semitic scripts to the so-called Phoenician is doubtful, since some letters differ greatly. Probably they represent "very ancient bifurcations from a script still plastic and not yet reduced to uniformity" (Gardiner).

Phoenician Theory Exploded

In any case, it is no longer possible to regard the Phoenicians as the inventors of the alphabet. Modern discoveries and investigations make it clear that they simply adapted systems that were already in use. The discovery of an ancient pre-Hellenic culture has suggested to some that even the Greek alphabet may not owe much to the Phoenicians. Sir Arthur Evans, as a result of the Minoan discoveries, held that the Phoenician alphabet itself is one of the fruits of Mycenaean culture; that the Cretan and Aegean forms are the more original, and were borrowed by the Phoenicians; that the so-called Semitic names are partly Aegean names and partly translations of Aegean names. This explanation of the names, however, is fantastic.

SEMITIC NAMES OF THE LETTERS. We have authorities for the names of the Greek letters as old as the fifth and fourth centuries B.C., and the names of the Hebrew letters can be carried back to about 700 B.C. The latter seem to rest on an ancient tradition, and there is every reason to suppose that they are as old as the proto-Semitic letters themselves. If some of them are doubtful in meaning and may be artificial formations, most of them are common Semitic words, which may well be taken as good evidence for the proto-Semitic origin of the forms. The usual pronunciation of the Hebrew names probably differs slightly from the original pronunciation. That original pronunciation, as constructed by the great Semitic scholar Nöldeke, to which we add the meanings as known or conjectured, is as follows: 'Alf, ox, Bēl, house. Gaml, camel, Delt, door, Hē, window?, Wau, hook or nail. Zain, weapon?, CHēl, fence?, Tēl, serpent?, Yod, hand,

Kaf, palm of hand, Lamd, ox-goad, Mēm, water, Nun, fish, Samk, prop or post?, 'Ain, eye, Pē, mouth, Sādē, javelin?, Qof, knot?, Rēsh, head, S Hīn, teeth, Tau, mark. The Greek names may be seen in column 2 of the Table of Alphabets on p. 330. It will be noted that the Greeks added several letters. The Semitic names are reminiscent of the origin of writing.

ORIGIN OF WRITING. When primitive folk wish to convey some idea to others otherwise than by speech, the most natural way to do it is to scratch rude drawings or pictures on stone or bark, or some other suitable substance. And we know that this is what the early Bushmen of South Africa, the natives of Easter Island, and other primitive folk did. They conveyed their ideas of objects and actions by means of pictographs. This suggests that the oldest alphabets consisted of pictures, and that when we find pictographs surviving in the alphabets of ancient civilizations, the names of the letters, if they clearly denote things, are primary and not secondary. If the name for B means Box, and B resembles a box, it is more natural to suppose that originally B was a picture of a box than that certain strokes = B were afterwards denominated box because the word for box begins with B, or because the strokes had come to resemble a box. Sir Flinders Petrie, on the other hand, thought that the alphabet originated in signories, such marks as were used by the Egyptian potters, but this suggestion has all anthropological probability against it.

ANCIENT PICTOGRAPHIC SCRIPTS. The origin of the alphabet in pictographs seems to be clearly shown by the literary monuments of Babylonia and Assyria, Crete and Cyprus, Egypt and Sinai, etc.

(a) **Cuneiform Pictographs.** The script of even the oldest (Sumerian) inscriptions of Babylonia represents a stage very remote from that in which each sign represents a picture. The ideograms have already become syllabic. But it is possible to get back beyond the wedge-shaped variety of cuneiform to a linear type, and in some cases to discern in the linear outlines the remains of a picture. Thus, according to Morris Jastrow (*The Civilisation of Babylonia and Assyria*, 1915), the linear form of the sign for sun, day, light, is clearly a derivative of the sun sending forth its rays. In the linear form of the sign for eye, face, seeing, it is not difficult

to see the outlines of an eye. The linear form for the sign for man suggests a man on his back.

(b) **Hittite Hieroglyphs.** The Hittite script has not yet been deciphered, and of it there are several styles of characters. But some of them are pictorial, while others are seen branching off into conventional forms which tend towards becoming linear.

Cretan Pictographs

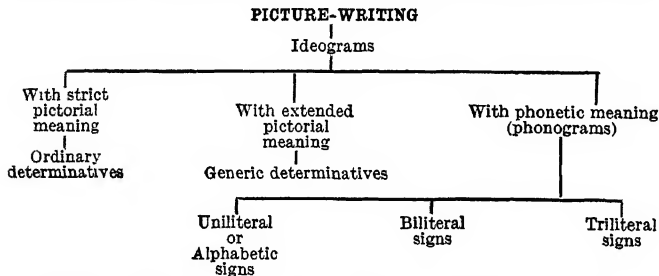

(c) **Aegean and Cypriote Pictographs.** Explorations in Greece and the surrounding archipelago have revealed the existence of an Aegean civilization of great antiquity, and an intercourse between Crete and Greece, Egypt, Syria, and other countries centuries before the maritime activities of the Phoenicians. Many pictographs have been discovered in Crete, as shown by Sir Arthur Evans in his book on Cretan pictographs (1895) and in various articles. At Praesos were found stones inscribed, not only with hieroglyphs and pictures, but also with linear or quasi-alphabetic characters. Some of the symbols found at Cnossos show an approach to the ideographic stage of writing. The forms in the Cypriote syllabary, the script discovered in Cyprus, often show a parallelism with Cretan forms, but seem to be more closely related to those of the Hittite syllabary.

(d) **The Phaestos Disk.** The Phaestos Disk, a disk of terracotta, was found in the excavation of the Cretan palace of Phaestos, and belongs to about 1600 B.C. The inscription, which has not yet been deciphered, is in some form of picture-writing. The script is older than the Phoenician alphabet, and Macalister thinks it may even have been its model. He thinks it not unreasonable to suppose that in process of time the script of the disk would become simplified into just such a linear script as that alphabet.

EGYPTIAN HIEROGLYPHS. The development of pictographic writing is best illustrated by the Egyptian hieroglyphic writing, the nature of which is summarised by Dr. Alan Gardiner as "a combination of rebus-writing with phonetic writing." It starts with picture-signs, or ideograms. Thus the Egyptians, to convey the notion of the ibis-god Thoth depicted an ibis perched on a standard such as was carried in the priestly processions; to indicate the meaning head, they depicted a human head; to indicate house, they drew the ground-plan of a house. Actions could be described in the same way. The image of

a man making a wall is used to indicate the verb to build.

But the pictures in Egyptian hieroglyphics became phonograms as well as ideograms. Thus, for instance, the word used for eye was pronounced *yiret*. A great advance was made when the hieroglyph of the eye was used to spell words which had nothing to do with eye, but the sound of which resembled closely the sound of *yiret*, the word for eye. The principle corresponds to what we know as rebus-writing. If we wished to render *manly* in this way, we might depict a little man and a bed (= lie = ly). A further development of phonograms results in biliteral or trilateral signs, and then in uniliteral or alphabetic signs. Dr. Alan Gardiner, in *The Nature and Development of the Egyptian Hieroglyphic Writing* (*Journal of Egyptian Archaeology*, vol. II, pt. ii, April, 1915), illustrates it by the diagram below.

The final stage here represents what is known as the acrophonic principle. This paved the way for the later Egyptian scripts, the hieratic and demotic. A few bold strokes sufficed to depict the original object, and the letters, as in Chinese, came to bear little resemblance to the things from which they were derived.

SEMITIC PICTOGRAPHS. We have seen already that the names of the Semitic letters, or of some of them, denote common objects. The meanings of seventeen of the letters are more or less certain. If, now, we look at the letters of the Phoenician alphabet in the form in which we find it on the most ancient gems and seals (9th century B.C.) and on the Moabite Stone (c. 840 B.C.), we note that a number of them resemble roughly the things denoted by the names, e.g., particularly, *alf* = head of ox, *bēt* = house, *yod* = hand, *kaf* = bent hand, *mēm* = water, *ain* = eye, *pē* = mouth, *rēsh* = head, *shin* = tooth, *tau* = mark. In some cases the resemblance is even more marked in the South Semitic

scripts (the Sabaeen, Lihiyānite, Thamūdnic, and Safaitic). The obvious inference is that the Semitic alphabet originated and developed in the same way as the Egyptian hieroglyphics.

ORIGIN OF THE PHOENICIAN ALPHABET. The Phoenician alphabet can hardly have come into use on Syrian soil earlier than about 1000 B.C., for the available evidence goes to show that the Babylonian cuneiform script was officially employed throughout Syria for some time after 1400 B.C. Since records in cuneiform, Egyptian hieroglyphics, and possibly in Cretan script date back thousands of years before 1000 B.C., it must have been derived from or modelled upon one of the scripts of the older Mediterranean or Mesopotamian civilizations. Deecke attempted to derive the Phoenician alphabet from the Babylonian cuneiform. De Rougé sought its origin in the cursive Egyptian script known as hieratic.

Prütorius sought it in a syllabary resembling that used later in Cyprus. Sir Arthur Evans seeks it in the Minoan scripts which he has discovered in Crete. Lenormant suggested that the Phoenician alphabet was directly borrowed from the Egyptian hieroglyphs. Dr. Alan Gardiner strongly supports this view of its source, and discusses it in the light of evidence which, he thinks, puts the case for an Egyptian origin on an entirely new footing.

NEW SINAITIC SCRIPT. The fresh evidence is supplied by a new Sinaitic script. In the mining districts of Sinai have been found many hieroglyphic records dating from the First down to the Twentieth Dynasty. Among the monuments discovered in 1905 by the Egypt Exploration Fund under Flinders Petrie were ten with inscriptions in an unknown script. At first the forms seemed to be roughly graven Egyptian hieroglyphs, but some of them were soon observed to be signs which could not be identified with those of any known Egyptian style of

writing. M. Weill had already published a fragment which belongs to the same group. In these monuments the characters run sometimes in vertical columns and sometimes in horizontal lines. Flinders Petrie gives as the date of this writing about 1500 B.C. Now, we find here, on the one hand, signs which seem to have been borrowed from the Egyptian hieroglyphs, and, on the other hand, signs which are foreign to the Egyptian hieroglyphs, but which answer to the names or forms of the Semitic letters.

There are also a number of signs which do not resemble any surviving Semitic forms. But the resemblances to hieroglyphs and known Semitic forms seem to Dr. Alan Gardiner to support the view that not later than 1500 B.C. there existed in Sinai a Semitic alphabet modelled on the Egyptian hieroglyphs. Dr. Gardiner concludes that "the common parent of the Phoenician, the Greek, and the Sabaeen may have been one out of several more or less plastic local varieties of alphabet, all developing on the acrophonic principle under the influence of the Egyptian hieroglyphs."

OTHER SEMITIC AND ORIENTAL ALPHABETS. Closely related to Hebraeo-Phoenician is the language of the Aramaeans, which spread over all Syria and Palestine and even beyond. From the Aramaean script were derived the Hebrew, Syriac, Mongolian, Parsi, Arabic, Pehlevi, Armenian, and Georgian. The Syriac and Arabic scripts are cursive as compared with the Hebrew. Most of the ancient Semitic inscriptions, like most of the ancient Greek inscriptions, are written from right to left. But some of the Semitic inscriptions, like some Greek inscriptions, are written alternately from right to left and left to right. The former method came to prevail for the most part in the Semitic languages. In the case of Greek, the latter method obtained a complete victory. All the modern Indian scripts which are descended from the Devanagari characters are of Semitic origin, if Dr. G. Bühler is right in tracing back these characters to an ancient alphabet of North Semitic type.

GREEK AND OTHER ALPHABETS. The Greek alphabet was derived from the Phoenician, but from a form of it which is earlier than that of the most ancient gems and the Moabite Stone. Some of the forms, e.g. those for Greek λ and α, resemble the Sabaeen more

than the Phoenician. Of course, the Greeks remodelled the Phoenician letters. They gave certain consonants a different value, even converting some of them into vowels, and they added more consonants. For instance, they had no use for some of the peculiar guttural sounds in Semitic. Semitic Alf is not really equivalent to A. The sound is best represented by a soft breathing. It is really 'Alf, the *a* sound facilitating the pronunciation. 'Ain, again, may best be represented by a hard breathing. It seems to have sounded to the Greeks *au*, whence the value *o* which they gave it. Ignoring the initial guttural sounds of Hē and CHēt, they converted the letters into *ε* and *η*. The Greek alphabet thus remodelled was passed on to the Etruscans, the Romans, the Copts, and the Russians.

LATIN AND OTHER ALPHABETS. The Latin alphabet is derived from the Chalcidian form of the Greek, the form used at Chalcis in Euboea, an island of the Aegean. It was taken to southern Italy by Greek colonists about the 8th century B.C. The Irish script, usually called the Irish uncial or semi-uncial, seems to have been introduced by S. Patrick from the south of France some time in the 5th century. It was evolved from the local 5th century cursive, whereas the Roman uncial was derived in the main from the capitals.

THE ENGLISH ALPHABET. The English alphabet can be traced back for about twenty-three centuries to its home in central Italy. It is a member of the Latin family of alphabets, and English printed letters are still called Roman type. They resemble the Latin forms used by the Italian printers of the 15th century, which in their turn were imitations of the forms used in the minuscule MSS. of the 10th and 11th centuries. These minuscule letters were so called from their small size. They are cursive forms of the larger and earlier uncial letters, which again were derived from the Roman letters, of the Augustan age. These Roman letters correspond loosely to the capital letters now used by printers. The well-known inscriptions of the Scipios relate the letters closely to those employed in the 3rd century B.C.; and these again do not differ much from forms used, probably towards the end of the 5th century B.C., in the earliest existing specimens of Latin writing.

Naturally the Latin letters had to be adapted to some extent to suit English sounds. The Latin I was converted into I and J, the

Latin VV or UV into U=W. In Phoenician and Hebrew *y* is the tenth letter and *z* the seventh. The position of Y and Z at the end of the English alphabet seems to be due to the fact that they were a late introduction into the Latin alphabet from the Greek, and were used only in Greek loan-words. It has been pointed out that Q and X were not of much service to the Romans, and are of equally small service in English. Almost equally useless is the letter C in the English alphabet as an addition to K. The English alphabet is therefore capable of simplification. The Anglo Saxon, which is thought to be partly Roman and partly Irish in origin, adopted from the Runic two signs for W and TH, at one time included in the English alphabet.

Bibliography. The Alphabet, Isaac Taylor, 1883; Comparative Grammar of Semitic, W. Wright, 1890; Story of the Alphabet, Edward Clodd, 1913; The Formation of the Alphabet, Sir W. Flinders Petrie, 1912; The Loom of Language, ed. L. Hogben, 1944; and the various works referred to in this article. See also the articles on the different letters of the alphabet.

Alpha Centauri. Double star, both of whose components are stars of the first magnitude. It is one of the nearest stars to the solar system. The masses of the two stars composing it are very nearly equal, and one of them appears to be in size and composition a close counterpart of our own sun. See Stars.

Alpha Crucis. Brightest star of the Southern Cross. It is a triple star, but while two of its components are between the first and second magnitudes, the third is only of the sixth magnitude. The two brighter stars are very nearly matched.

Alpha Cygni. One of the 20 brightest stars in the sky and probably one of the four brightest stars in our stellar universe. Its distance is so great that it cannot be measured directly but is inferred from its spectrum to be about 500 light years.

Alpha Particles (OR RAYS). Particles emitted spontaneously by radio-active elements. They are ionised helium atoms. Lord Rutherford (*q.v.*), by bombarding certain light elements with alpha particles, was able to break up the atomic nuclei. See Atom; Beta Rays; Gamma Rays.

Alphege OR ALPHAGE (954-1012). An English archbishop, saint, and martyr. After having been a monk at Deerhurst and also an anchorite and abbot at Bath, he was made bishop of Winchester in 984 and archbishop of Canterbury

in 1006. He laboured at the conversion of the Northmen and among his own people for the abolition of slavery. Captured by the Danes at Canterbury in 1011, he refused to raise money for ransom from his tenants, and was murdered April 19, 1012. He was buried in S. Paul's Cathedral. His body was removed in 1023 to Canterbury. Declared by Anselm a saint and martyr, he is commemorated in the dedication of several churches in England. That in London Wall was demolished in 1919, only the porch remaining.

Alpheus. The chief river of Peloponnesus, Greece. The modern Ruphia, it rises in the S.E. of Arcadia, and flows past Olympia to the Ionian Sea. The fact that it was thought to be partly subterranean gave rise to a legend that the nymph Arethusa, surprised while bathing and pursued by the river god Alpheus, was transformed by Artemis into an underground spring, and reappeared in the island of Ortygia, near Syracuse.

Alphonso OR ALFONSO. Masculine Christian name of Teutonic origin, and meaning eager for battle. As Alphonse it is common in France. A Spanish variant is Alonso.

Alphonso (d. c. 914). Last king of Asturias, known as The Great. He succeeded his father Ordoño I in 866. His reign was marked by successes against the Moors and the consolidation of the kingdom of Galicia, but his incessant warfare impoverished his subjects and bred internal disorder. He abdicated, and died at Zamora.

Alphonso (1030-1109). King of Leon and Castile, known as The Brave. After the death of Ferdinand I. of Leon, Castile and Galicia in 1065, his kingdoms were divided between his second son Alphonso and his brothers Sancho and Garcia. War followed. Alphonso was driven out by Sancho and took refuge with Al Mamun, the Moorish king of Toledo. On Sancho's assassination in 1072, Alphonso returned to Leon and united the three kingdoms under his rule. In 1084, after Al Mamun's death, he took Toledo, but was defeated by the Almoravides at Zalaca in 1086.

Alphonso (d. 1134). King of Aragon and Navarre, known as The Fighter. He was the second son of Sancho I of Aragon and the husband of Urraca, daughter and heiress of Alphonso the Brave of Leon and Castile. His marriage was annulled, and he was superseded in Leon and Castile by his stepson. Fighting often against the Moors, in 1118 he took Saragossa, and in 1120 defeated them

at Cutanda. His bequest of his kingdom to the Knights Templars and other military orders was not fulfilled.

Alphonso (1221-84). King of Castile and Leon, surnamed The Astronomer and The Wise. He succeeded to the throne in 1232. He was the first to encourage historians to write in the Castilian tongue. The legal code *Las Siete Partidas* (The Seven Laws) was begun under his patronage. See *Alfonsine Tables*.

Alphonso (1385-1458). King of Aragon, Sicily and Naples, surnamed The Magnanimous. In 1416 he succeeded his father, Ferdinand I, as king of Aragon and Sicily. After a long struggle he took Naples in 1442 and was recognized king by Pope Eugenius IV. He died at Naples.

Alphonso (1643-83). King of Portugal. He was the second son of John IV, whom he succeeded in 1656. As a result of a plot between Alphonso's wife and his brother Pedro, Alphonso was deposed in 1667 in favour of Pedro. Banished to Terceira, in the Azores, he died at Cintra.

Alphonso XII (1857-85). King of Spain, the first Alphonso of united Spain, but the twelfth of Leon and Castile. The son of Queen Isabella II, who abdicated in 1870, he was proclaimed king in 1874, and in 1876 suppressed the Carlist rebellion. After the death in 1878, in the first year of marriage, of his wife, a daughter of the duke of Montpensier, he married Maria Christina, daughter of the archduke Charles Ferdinand of Austria. He died Nov. 25, 1885.

Alphonso XIII (1886-1941). King of Spain. The son of Alphonso XII and his wife Maria Christina, he was born after his father's death, being therefore a king from the day of his birth, May 17, 1886. Until 1906 his mother acted as regent. In 1906 he married Victoria Eugénie (Ena) of Battenberg, niece of Edward VII. On their wedding day, May 31, a bomb, hidden in a bouquet of flowers, was thrown at the bridal coach. This was only one of several attempts made at various times to assassinate the king. In the sphere of politics, because of the laxity of party politicians, more and more responsibility was thrown upon the king during his reign. In 1924 he supported the dictatorial form of government set up by Primo de Rivera (*q.v.*). The municipal elections of 1931 showed large gains for the republican cause and Alphonso left Spain in

Alfonso XIII

April of that year, though without any formal abdication, in the hope of saving Spain from civil war. Thenceforward he lived mostly in Italy, dying in Rome from angina pectoris, Feb. 28, 1941.

He had four sons and two daughters. The eldest and second sons renounced their rights to the Spanish throne, the eldest dying in 1938. Six weeks before his own death Alphonso, finally renouncing his own rights, proclaimed the third and sole surviving son Juan "king of all the Spaniards when Spain judges it opportune." *Consult Life*, Robert Sencourt, 1942.

Alpine Club. A British club, the first of its kind, founded in London in 1857. Its membership is confined to those who are interested in mountaineering, especially in connexion with the Alps. It has issued since 1864 *The Alpine Journal*, and its headquarters are at 74, S. Audley Street, London, W. There are many other Alpine clubs in Europe and several in other parts of the world, especially in the U.S.A., Canada, and South Africa.

Alpine Glow. Hues caused at dawn by the falling of light upon the snow of certain Alpine mountains. The snowy expanses which cap the high Alps flush with exquisite shades of colour in anticipation of the sunrise. This recurrent effect contributes to the attractiveness of Switzerland.

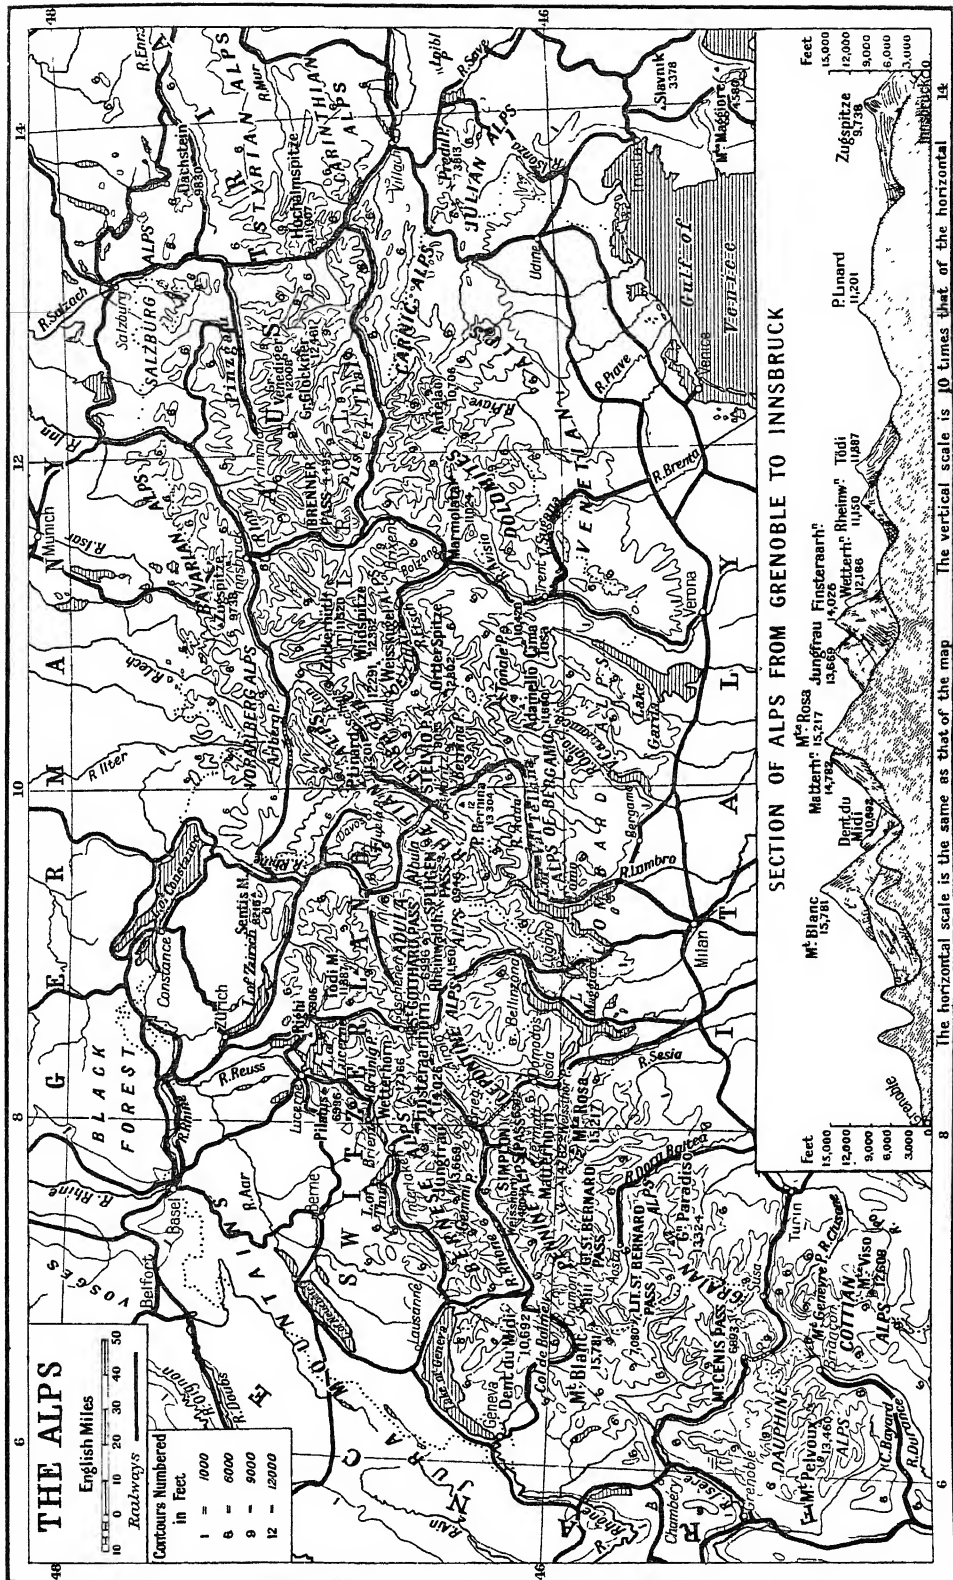

Alpini. Italian soldiers recruited mainly in the Alps and trained for special tasks. They are selected men formed into special regiments, which have pack-mule transport and mountain two-horse vehicles. They do not ordinarily form part of the field armies, but are intended to be employed locally with mountain artillery as covering troops. In 1939 there were five regular divisions.

During the First Great War one of the exploits of the Alpini was the capture of the Adamello glacier. (See *Adamello*.) In the Italo-Greek campaign of 1940-41 the 3rd Alpini division fought against Greek Evzones in the mts. of the Epirus and suffered a heavy defeat at the battle of the Pindus, Nov., 1940. Alpini also fought against British Imperial forces in Eritrea and Abyssinia in 1941, and were used in the African desert campaigns. Italian forces sent to fight in Russia, 1941-43, included Alpini troops, among them the famous Julia division. After Italy's capitulation to the Allies in Sept., 1943, Alpini units fought in Italy against the Germans with the Anglo-U.S. armies. In 1945 many of these troops formed part of the Italian Liberation army, being supplied with British battle-dress.

Alpnach OR ALPNACHT. Village of Switzerland, in the canton of Unterwalden. It stands on the slopes of Mt. Pilatus, 8 m. S.S.W. of Lucerne, a starting point for the ascent, and has a station on the Lucerne-Brünig-Brienzen rly.

Alpini. With rifles slung across their shoulders, patrols of these specialised Italian forces cross a snowfield in the Alps on skis

Although Switzerland is generally regarded as the Alpine country of Europe, the mountainous system to which is given the comprehensive title of the Alps extends west into France, east into Bavaria and Austria, and South into Italy. Indeed, the highest peak of the system, Mont Blanc (15,781 feet), is French territory, having been formally recognized as such by treaty in 1861. All the other peaks above 12,000 feet, which are shown in the section of the Alps from Grenoble to Innsbruck, are, however, in Switzerland

ALPS: GREAT MOUNTAINOUS SYSTEM STRETCHING ACROSS THE BORDERS OF FIVE COUNTRIES

ALPS: MOUNTAIN REGION OF EUROPE

Below is described geographically and historically the mountainous system of south central Europe. Reference is also made to Alpine climbing and literature. See also Dolomites; Geology; Mountaineering; Tirol; Switzerland, etc. Map on page 335

The term Alps is generally used to denote the ranges and groups of lofty mountains in the S. of central Europe, bounded, roughly speaking, on the S. by the Italian plains, on the W. by the Rhône valley, stretching E. almost to the plains of Hungary, and on the N. descending to the less elevated but still hilly country of N. Switzerland, Bavaria, and Upper Austria. They are usually treated as divided into three main sections, the W., Central, and E. Alps. The W. Alps include the Maritime, Cottian, Dauphiné, and Graian Alps; the Central Alps include the Bernese Oberland on the N. and the Pennine Alps on the S. of the upper Rhône valley, the Lepontine, and Adula Alps, Tödi range, N.E. Swiss and the Bernina Alps, and Rhaetian Alps; the E. Alps extend through E. Tirol and Styria and the N. of Venetia and end in the Carinthian, Carnic and Julian Alps.

Meaning of the Word Alps

To represent the Alps as a single defined chain is utterly misleading. It should be noticed that, as used in this mountainous district itself, the word alps does not mean the peaks or mountain ranges, but upland pastures where cattle and goats graze in summer. Rising from the hot low valleys through vineyards on the S. slopes, past the deep gorges through which the torrents force themselves under pine woods or, on the Italian side, groves of chestnuts, a region of clear air, flowers, green pastures, and clear springs is reached: here, too, the peasants have built chalets with the rocks and snowfields above and ravines, woods, and valleys below. So there are Wengern Alp, Riffl Alp, Bel Alp, Engstlen Alp, and hundreds of others on the sides of the higher mountains which have become the playground of Europe.

The region of these Alps is from about 5,000 ft. to 7,000 ft. or more above the sea level: the high mountain peaks rise above them to a height of from 10,000 ft. to 15,000 ft. The few over 14,000 ft. occur only in the group of Mont Blanc, of the central Pennines in the Zermatt region, and one, the Finsteraarhorn, in the Bernese Oberland. The highest peaks of the Alps, further E., viz. the Ortler Spitze, the Gross Glockner, the Gross Venediger, and the Wildspitze, range between 11,000 ft. and 13,000

ft. While only two summits in the whole region are over 15,000 ft. high, there are dozens over 12,000 ft., from Monte Viso in the far W., on the border of Dauphiné and Piedmont, to the Gross Glockner in the E., and many scores over 10,000 ft., in both the main chain and outlying groups.

The Building of the Alps

How was this mountain region, with its infinite variety—a terror to the ancient world, a joy to the modern—formed? Volumes have been written on the subject, elaborate researches made, theories propounded. It seems that the region was first elevated by forces from below. As the earth cooled and its crust contracted, strata, which at first may have been horizontal, were squeezed together by lateral thrusts, often crushed, one part elevated, another depressed. To quote Prof. Bonney, whose work on the Building of the Alps should be carefully studied by all interested in the subject, "Such a chain as the Alps may be described as composed of a series of rock masses, in part at least deposited in successive layers, and then bent into wave-like folds, as a number of heavy carpets laid one on another would be if their opposite ends were brought (pushed) nearer together. These folds are sometimes comparatively gentle, sometimes exceedingly sharp. Occasionally the thrust is so powerful that the folds are bent over in the opposite direction; sometimes the rock masses are even broken under the strain and the upper part of the fold slides forward over the lower. While these disturbances were in process, heat and cold, rain and river, snowslide and glacier, in some cases also waves of the sea, were sculpturing and transporting, so that the mountain peaks are in many cases only remnants of masses far more gigantic; that vast rocky wall which rises so grandly against the sky is a mere ruin of the huge bulwark which once guarded the Italian lowland."

The Alps that from a distance look so still, white with their eternal snows, immutable in their adamantine strength, are really never at rest. Even the stillness of night is broken by the roar of the torrents carving their courses deeper and deeper and bearing with them the stones and sandy

silt which they will deposit in the valleys below, by the thunder of the avalanche, the hissing and howling of the wind among the peaks, and the loud report of breaking ice. "I am well persuaded," says Ruskin, "that the more familiar anyone becomes with the chain of the Alps, the more the idea will force itself upon him of their being mere remnants of large masses, splinters and fragments as of a stranded wreck, the greater part of which has been removed by the waves."

The varying shapes of the higher peaks, whose sharp edges and points show them to have been above the action of glacial ice, are due partly to the influences to which they have been subjected, and partly to the different characters of the rock of which they are compounded. The higher summits are principally of gneiss or mica schist, and sometimes of granite. These older crystalline rocks are flanked by rocks of later origin and include limestones and dolomite in huge masses, with great cliffs. At times they assume the most picturesque and varied forms and the richest colour, as in the dolomite region E. of Botzen on the borders of Italy and Tirol.

Rivers and Great Lakes

A marked feature of the Alpine region is its greater steepness on the S. side; the plain of Lombardy is only a few feet above the sea, whereas the Lake of Constance, which is much farther from the great central ranges, is 1,300 ft. above the sea level. The rivers on the S. side descend with fairly straight course to the Po, while on the N. side the Rhine flows in its rapid upper course N.E. by E. and then N., and, after passing through the great lake, nearly due W., until it turns again N. at Basel.

Crossing the main Pennine chain by the Weissthorn pass near Monte Rosa from the N., you ascend by a long glacier to extensive and rather gentle snow slopes, but on reaching the summit of the pass suddenly look down precipitous rocks thousands of feet into the deep Val d'Anzasca. On the N. side of the pass is the expanse of glacier, with its steady imperceptible movement, on the S. the mountain ridges keep up a recurrent bombardment of falling stones down their precipices.

So on the S. side, the great lakes which fill the deepest depressions in the folds of the mountains—Maggiore, Como and Garda—lie N. and S. at right angles to the main chain; whereas the general direction of those on the N. side,

Lucerne, Zurich, and Constance, and also the Lake of Geneva, which lies N. of the highest mountains—though the Rhône, after flowing almost N. from Martigny to the lake, ultimately bends to the S.—is E. and W., parallel to the main chain. No water from the Alps goes to the Baltic; it is to the Danube that by far the greater part of the E. Alps is drained.

Historically the Alps have formed a barrier between N. Europe and Italy, impassable except by certain well-known routes, and then as a rule only in summer. The lowest important pass across the main chain is the Brenner (4,500 ft.), dividing the mountains of E. and W. Tirol. It was known to the Romans and used by the barbarian invaders. By this pass the first railway route from Germany to Italy crossed the Alps. It was opened in 1867, and the main ranges have since been pierced by railways near Mont Cenis in the W. in 1871, in the centre by the St. Gotthard tunnel in 1882, and between the Rhône Valley and the Lago Maggiore by the Simplon in 1906. From the time of Hannibal the crossing of the Alps has been a difficult problem for military leaders aiming at Italy, and the story of the various Alpine passes is full of interest. The Alpine region, too, has been the home of a hardy race, free and independent, protected from many of the devastating wars which have swept over the plains. Despotism does not flourish in mountain air.

Some Notable Ascents

Alpine climbing, as a sport exercising body and mind, may be taken to date from the middle of the 19th century. Prior to that time some of the higher Alps had been ascended, notably Mont Blanc, the summit of which was first reached by two guides from Chamonix in 1786, at the instance of De Saussure, and by De Saussure himself the following year. Other peaks were conquered, especially in the Oberland, early in the 19th century. In 1854 came the ascent of the Wetterhorn by Alfred Wills (afterwards Mr. Justice Wills), brilliantly recorded in his *Wanderings Among the High Alps*; in 1855 of Monte Rosa by G. and C. Smyth and others of an English party; in 1861 of the Weisshorn by Tyndall, and in 1865 of the Matterhorn by Edward Whymper with a party of seven, four of whom lost their lives in a terrible accident when descending. Since that time almost every

peak in the whole Alpine region has been repeatedly ascended. The English Alpine Club was formed in 1857, and in its *Journal* since 1864 has published regularly accounts of new routes. No corner of the mountain region of central Europe now remains unexplored. "Climbing is no longer a laborious curiosity." Each of the greater peaks is the subject of a regular tariff of fees for guides, who often convey quite inexperienced tourists to places once deemed inaccessible.

Weather and Climbing

But still for the true climber there are difficulties to be surmounted, taxing all the energies of body and mind to the utmost. Weather conditions may make an "easy mountain" difficult, dangerous, or impossible. Mountain craft is learned only with close attention and long practice.

Alpine literature, dealing not only with climbing and discovery but with the geology and petrology of the mountains, their flora and fauna, and the ethnology and history of the inhabitants, now forms a great library.

Alpujarras, LAS (Arabic *Al-busharat*, land of rich pasture). Mountainous district in Granada and Almeria provs., Spain, S. of the Sierra Nevada and N. of the Sierra Contraviesca. Beautiful and fertile, it produces grapes, oranges, and figs in abundance.

Alruna. In Norse mythology, the runes which were whispered to Odin by Mimir's head after it had been cut off by the Vanir. These runes, or wise sayings, were distributed among the Aesir, the Elves, the Vanir, and mortal men.

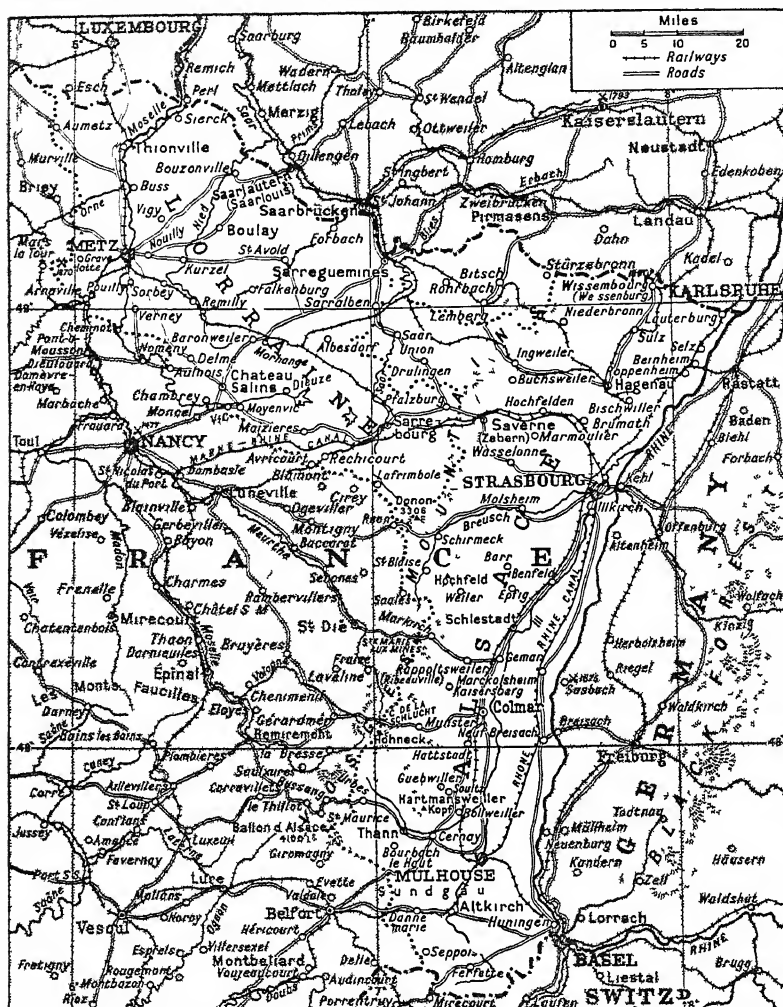

Alsace (Ger. *Elsass*). District of France between the Rhine and the Vosges Mts., with Lorraine to the N. and Switzerland to the S. It comprises the departments of

Bas and Haut Rhin, and covers about 3,200 sq. m. Strasbourg is the historic capital, other important towns being Colmar and Mulhouse. Its chief river is the Ill, and geographically it is divided into two parts, a mountainous region in the W. and a plain in the E. Well timbered and fertile, it is largely engaged in agriculture. Wine is produced, and manufactures include leather, glass, chemicals, and cotton and woollen goods. Pop. (pre-war) 1,219,381.

Alsace has had a varied history. The name probably means the country of the Ill, and its earliest inhabitants of whom anything is known were Celtic tribes, who were subdued by King Ariovistus, he in his turn falling victim to the superior genius of Julius Caesar. For nearly 500 years Alsace was part of the Roman Empire, and in the 4th century it was seized by the Alamanni. Later it became part of the kingdom of the Franks; in 870, by virtue of a treaty, it became German, and for some time was part of the German duchy of Swabia. In the 12th century, being still in the German kingdom, it was ruled by land-graves, between whom and the prospering towns there was considerable rivalry. About 1500 the Alsatian peasantry revolted against the miseries of their lot, and a few years later the Alsatian townsmen eagerly accepted the teachings of the Reformers.

In the 16th century there was a good deal of intercourse between France and Alsace, and after the Thirty Years' War had ravaged the land Louis XIV obtained possession of it. He did this by making the most of certain rights handed over to France by the treaty of 1648, and in 1681 finished the work by sending his troops to seize Strasbourg. Then, by treaty in 1684, Alsace became part of France, and so remained until 1871. In the main this was a prosperous period, although in the 18th century there was a certain amount of religious persecution, and in the early 19th a marked dislike of the restored Bourbon kings. In 1871, following the Franco-Prussian war, Alsace was taken by Germany and with most of Lorraine became the imperial province of Elsass-Lothringen, known outside Germany as Alsace-Lorraine. The story of Alsace-Lorraine from 1871 to 1919 is told under that heading.

The recovery of this lost territory was an avowed desire of France for over forty years, and

Alsace and Lorraine. These two countries were taken by Germany from France after the war of 1870-71, and restored to France by the peace treaty following the First Great War. They were again in German occupation from June, 1940, to November, 1944

the early stages of the First Great War saw some abortive French attempts to stage attacks in Alsace. They could not be sustained because of the need for a concentration of French force in meeting the development of the German advance through Belgium. Only one French army could be spared to hold the Vosges as far N as Donon. The Germans were equally unable to sustain any offensive, as they had to send men to Flanders and the Aisne. A French attempt to advance on Mulhouse at the end of 1914 was checked by the Germans, and finally stopped by violent snowstorms early in the new year.

Thenceforward the position was one of stalemate to the end of the

war. The Germans had the advantage of an admirably system, which enabled them to move troops quickly from point to point. Moreover, it became clear to the French that unless they were prepared to besiege Strasbourg and venture a major campaign on the Upper Rhine, there was nothing to achieve by small local advances.

Alsace, with Lorraine, was restored to France in 1919 by the treaty of Versailles. A very real problem arose, however, through the large number of its inhabitants who were German in speech and culture if not in political leaning. In 1926 a movement was launched for local autonomy, and some semi-Nazi parties came into being.

These were suppressed, a number of the leaders being arrested in 1939 after the outbreak of the Second Great War.

Strongly fortified sections of the Maginot line (q v) ran along the French side of the boundary between Alsace and Germany, the town of Strasbourg being included in the great defensive works. But in May and June, 1940, the Maginot line was outflanked from the N, and with the surrender of Belfort, Mulhouse, and Strasbourg further resistance in Alsace was useless. Many French soldiers escaped to Switzerland. On June 23, the day after the acceptance by the French govt of the German armistice terms, the Germans announced the end of the battle of Alsace with the capture, including those taken in Lorraine, of half a million prisoners.

By August, 1940, the names of all streets, shops, and hotels in Alsace were changed from French to German. Only German newspapers were permitted in Strasbourg. A Nazi Gauleiter was appointed, who declared that Alsace would "rapidly retake its old

place within the great German national community." In Sept., 1940, the German language was proclaimed (by radio) to be the official language of Alsace.

In Feb., 1942, the creation was announced of a "greater Strasbourg," by the amalgamation of the Alsatian capital with the German town of Kehl on the opposite bank of the Rhine. German civil law was introduced in 1943, and heavy repressive measures such as deportation to Germany, forced labour in settlements, or imprisonment in concentration camps, were taken against any sign of resistance.

After the rapid Allied advance across France in Aug and Sept., 1944, Gen Patton's 3rd U.S. army

swept to the Maginot line in the Alsace region. Strasbourg fell to French troops on Nov. 23. There were German counter-attacks in N. Alsace and the Colmar area in Dec., 1944, and Jan., 1945, but they were fiercely resisted; and on Feb. 9, 1945, it was announced that the whole of Alsace was once more cleared of German troops. *See also* Lorraine.

Alsace-Lorraine. District consisting of most of Alsace and a considerable portion of Lorraine, taken by the Germans from France in 1871 and restored to France in 1919. Seized from France in 1940, it again became part of the German Reich, until liberated in the Allied campaign of 1944-45.

The area is 5,605 sq. m. Under the German rule of 1871-1919 it was divided into three districts, Upper Alsace, Lower Alsace, and Lorraine. The French departments covering the area are Haut-Rhin, Bas-Rhin, and Moselle.

The treaty signed at Frankfurt between France and Germany in 1871 provided for the cession of Alsace, except only the fortress of Belfort and a region around it, and of the E. part of Lorraine, the W. part remaining French.

The object of Germany was to make the imperial province of Elsass-Lothringen, as the Germans called it, a thoroughly German district. An article in the treaty of 1871 allowed those inhabitants who wished to remain under French rule to move away within fifteen months. Nearly 60,000 persons did so. After 1875 trouble arose owing to the arbitrary action of the Germans. The deputy from Metz was expelled from the Reichstag, social organizations were dissolved, and four Alsatians were punished for belonging to a league of patriots. Moreover, schools were closed and prominent persons exiled, deprived of office, or punished in other ways. The use of French names, both for Christian names and trading purposes, was forbidden, the German garrisons were increased, and steps were taken to make Strasbourg University a centre of German influence. After about 1895 there was somewhat less of this repressive policy, and the French spirit was strong enough to demand in 1905 the compulsory teaching of French in the schools. The Germans, however, had achieved their main end, since in 1910 1,643,260 of the inhabitants (nearly 90 p.c.) spoke German, and only 204,262 spoke French. This led to difficulties for the French when the

Alsatian Wolf Dog. Breed of large, powerful, and intelligent dog

territory was restored to them by the Treaty of Versailles, 1919.

After the fall of France in June, 1940, the Germans promptly annexed the district, incorporating it in the Reich once more. Lorraine, with the Saar, made up the German Westmark, with a status similar to that of Ostmark (Austria). Two Nazi gauleiters were appointed, one for Alsace, the other for Lorraine. The use of the French language was forbidden and every attempt was once more made to Germanise the people by force. This attempt ended abruptly with the liberation of Alsace and Lorraine by Allied armies in the battles of 1944-45. *See* Alsace; Lorraine.

Alsatia. Name given to a sanctuary, or refuge for malefactors, in the Whitefriars district of London, between Fleet Street and the Thames. Alsace, or Alsatia, was debatable land between France and Germany, hence the application of the term. The sanctuary had a rude but flourishing existence during the 17th century, and was deprived of its privilege in 1697. Scenes in Scott's novel, *The Fortunes of Nigel*, are laid here. The site is now occupied partly by printing and publishing houses.

Alsatian Wolf Dog, OR GERMAN SHEPHERD DOG. Originally bred by Alsace shepherds before the First Great War, this handsome and unusually intelligent dog attracted notice by its work in the battlefield with the German and French armies, and sprang rapidly to popularity in the United Kingdom during the 1920s. When properly handled and trained in habits of strict obedience, the Alsatian is an agreeable companion in the home, strong, active, high-spirited, and requiring plenty of exercise. A good specimen stands from 22 to 26 ins. high at the shoulder, and has a general wolf-like appearance, with an alert, vigilant carriage of head and ears, and a smooth close coat of

grey, fawn, black, or black and tan. Alsatians are widely used for police work and as guide dogs for the blind. A beneficent use to which they were put in the Second Great War was in assisting Civil Defence workers to locate people who had been buried under the rubble of bombed buildings. *See* Animal; Employment in Wartime.

Alsen. Island of Slesvig-Holstein, in the Little Belt. Separated from the mainland by Alsen Sound, which narrows down from 2½ m. to 300 yds., its length is 20 m., breadth 11 m., and area 124 sq. m. Deeply indented on the W., it is picturesque and fertile and has fine orchards. Sonderborg, its chief town, has a good harbour and an old castle, in which Christian II of Denmark and Norway was imprisoned from 1532-49; from it a rly. runs N. to Norborg. Formerly Danish, it was captured by the Prussians in 1864, the event bringing the Danish war to an end. In 1920 it was returned to Denmark as the result of a plebiscite.

Alster. River of Slesvig-Holstein. It is a tributary of the Elbe, which it joins at Hamburg. It is 32 m. long, and navigable. Outside Hamburg it forms a large lake, the Outer Alster (about 430 acres), and within the town a smaller lake, the Inner Alster.

Alston. Market town of Cumberland, England, in the extreme E. of the co. Lying nearly 1,000 ft. above sea-level in the south Tyne valley of the Pennines, it claims to be the highest market town in England. Lead-mining has flourished, but the deposits are nearing exhaustion. Manufactures include flannel and thread. There is railway connexion with Haltwhistle, Northumberland. Market day, Sat. Pop. 2,678.

Alt (Ital. *alto*, high). In music, the first octave of musical notes above the treble stave. C in alt:

Altaian. Term denoting a branch of the human race whose physical and social characters were developed under mounted nomadism on the Central Asian steppes. It is preferable to Tartar or Turanian, as Altaic or Ural-Altaic denotes its language family. The physical type is marked by a sturdy, strong-boned, medium-sized, waddling body, with weak calves, shortish feet, wheat to bronze skin-tint, large mouth, broad face, flat nose, round head, prominent cheek-bones, low forehead, wide-set, keen-visioned,

deep-sunk eyes, brown to black, in oblique orbits, coarse, lank hair, and scanty beard. It includes the Mongol, Tungus, and Turkic stocks.

Altai Mountains. Great system of mts. in W. Siberia and Mongolia. The Mongolian name is *Altai-nula*, meaning golden mountains. They hem in the Central Asian plateau on the S. and S.W., and comprise the Russian Altai, extending N. from the river Irtysh to the Siberian Rly., and the Mongolian or Great Altai, running E. into the desert of Gobi. The Russian Altai contain the highest summit, Mt. Bieluka, estimated at 11,000 ft. The scenery for the most part is romantic. The region is rich in minerals, including coal, iron, gold, silver, lead, zinc, and copper, and porphyry, aquamarine, and jasper are found. Agriculture is pursued in the valleys.

Altair OR **ALPHA AQUILAE.** A white star, the soaring eagle of

the ancient astronomers. Its magnitude is 0.95 or brighter than the first magnitude, and its intrinsic brightness is about nine times that of the sun.

Altamaha. River of Georgia, U.S.A. Formed by the union of the Oconee and Ocmulgee, after a S.E. course of about 150 m. it enters the Atlantic by a considerable estuary 11 m. below Darien. It is navigable by small vessels.

Altamira. Palaeolithic cave, 308 yds. long, in Santander province, Spain. Herein, in 1879, mural paintings and engravings of the Magdalenian period were discovered, including polychrome roof-frescoes of animal subjects, mostly bison—a masterpiece of prehistoric art. See Art, Prehistoric.

Altamura. Town of Italy, in Bari province. It is 56 m. by rly. S.W. of Bari, *via Gioia del Colle*, has a cathedral founded in 1230, twice restored, and trades in wine, cereals, and cattle. Pop. 27,000.

Altar (Lat. *altare*, high place). Originally a structure on which victims were sacrificed or offerings of various kinds made to a divinity; in Christian churches, a table or stone on which the Holy Eucharist is offered. In prehistoric times altars were mounds, the high places of the Bible (2 Kings 23), or structures there set up, on which sacrifices or oblations were offered, and where the gods worshipped were supposed to dwell.

Among the Greeks and Romans altars were originally heaps of earth or turf; later, as were Oriental and Hebrew altars, they were round, oblong, or square structures of stone. They were decorated with garlands of leaves and flowers, sometimes with bas-reliefs and mouldings. As a rule every temple had two altars, a higher outside for sacrifice, and a lower inside for incense offerings and libations. Altars, which from early times were places of sanctuary (Ex. 21; 1 Kings 1 and 2), were also set up in the streets to the special divinity of the neighbourhood, in camps, and in private houses for the worship of the household gods.

The first altar mentioned in the Bible is that built by Noah (Gen. 8). In Moses' tabernacle and Solomon's temple were the altar of sacrifice or burnt-offering (Ex. 27, 1 Kings 8) and that of incense (Ex. 30, 1 Chr. 28), incense being a symbol of prayer (Ps. 141). Early Christians used tombs of martyrs in the catacombs as altars—hence stone or marble altars in Roman Catholic churches enclose relics of saints; then portable wooden tables came into use. Augustine refers to the *Mensa Domini*, Lord's Table, though the word table may mean what is partaken of as well as the table itself. From the rule one altar one church, still observed in the Greek Communion, altars in the Latin Church grew in number and magnificence as the churches grew in size, S. Peter's, Rome, having 29 in addition to the high altar.

The first English Prayer Book employs the words altar and God's Board; in the second Prayer Book, the words Table, Holy Table, or Lord's Table were substituted, though altar was retained in the Coronation service. Ecclesiastical courts have ruled that in the English Church altars must be of wood and movable. A small portable altar of wood, attributed to the 7th century, is in Durham cathedral library. From 1552, in English churches, the altar was commonly placed lengthwise in the chancel or body of the church; after 1660 it was replaced

Altamira. Vivid impression by a modern artist of prehistoric men decorating the interior of their cave. The animals shown are such as were discovered in the Altamira cave, Santander province, Spain, in 1879

A. Foregier

altarwise at the east end. The oldest known altar is in S. John Lateran, Rome; once in the catacombs, it is in form an ark-like chest, on the lid of which the Eucharist was offered.

Altar. An extinct volcano of Ecuador. A peak of the Eastern Andes, its height is about 16,300 ft. The name is also that of a river and town thereon in Sonora prov., Mexico.

Altazimuth (Lat. *altus*, high; Arab. *as-samut*, ways or paths). Instrument used in astronomy to

determine the exact apparent position of a star in the heavens at any instant. The star is observed through a telescope, which is in contact with a graduated vertical circle, the telescope being free to turn about a horizontal axis through the centre of the circle and perpendicular to its plane. The whole apparatus is so mounted that it can be rotated about a vertical axis, and the angle of rotation is shown by means of a graduated horizontal circle. Thus, when the telescope is pointed at a star, the reading on the graduated vertical circle gives the altitude of the star, and the reading on the horizontal circle gives the angle through which the vertical circle must be rotated from its standard north-and-south position in order

that its plane may pass through the star. This angle is called the azimuth, and altitude and azimuth together determine the star's apparent position. Altazimuths are used mostly on objects which cross the meridian in daylight.

Altcar. Village of Lancashire, England. It lies 2 m. S.E. of Formby, and is the headquarters of coursing in England, the Waterloo Cup being decided here annually in Feb.

Altdamm. Town of Poland, in Pomerania, with manufactures based on potato crops, *e.g.* starch and cellulose. It is at the head of the Dammsche See, 5 m. E. of

1505 to his birthplace, Ratisbon (Regensburg), where he was engaged upon a picture for the church of S. Peter. He designed the city ramparts against a Turkish invasion. Of his paintings, the Battle of Arbela and S. George and the Dragon (Munich) and a Nativity (Bremen) are notable. His talent as an engraver on both copper and wood gives him a place with the Little Masters. *Consult* Altdorfer, T. S. Moore, 1900.

Alten, KARL AUGUST, COUNT VON (1764-1840). A Hanoverian soldier. After serving in the Hanoverian army until it was disbanded in 1803, he joined the German legion in the British army, and fought in several campaigns between 1805-9. He commanded the famous division of light infantry in the later battles of the Peninsular War, and led a division at Waterloo, where he was wounded. In 1818 Alten, known in Britain as Sir Charles Alten, returned to Hanover and became minister for war and foreign affairs there, positions which he held until his death, April 20, 1840.

Altenburg. Capital of the former duchy of Saxe-Altenburg, Germany, 26 m. by rly. S. of Leipzig. It has a 14th century castle on a rock and a 16th century town hall. It manufactures bricks, cement, cigars, woollens, gloves, hats, playing cards, optical instruments, and sewing-machines. Pop. 42,570.

Alten Fjord (OR FIORD). Inlet of Norway, in Finnmark co., in the Arctic circle. Running S. from Soro sound, it breaks into two arms, the town of Alten lying between them. On Sept. 22, 1943, the Tirpitz, then the largest and most powerful German battleship, was damaged by British midget submarines while at anchor in Alten fjord, and further damage was inflicted on her there in an attack by Barracuda aircraft of the Fleet Air Arm on April 3, 1944. The German battleship Scharnhorst also used Alten Fjord as a hiding-place for a time. She was enticed therefrom by the sight of a Russian-bound British convoy on Dec. 26, 1943, and did not return, being sunk off North Cape after a twelve-hour chase by units of the British Home fleet. *See* map, p. 347.

Altengaard. A seaport of Norway, in Finnmark co. At the head of Alten fjord, 53 m. S. of Hammerfest, it has a meteorological and magnetic station.

Altenstein. Castle in Thuringia, Germany. It is 13 m. S.E.

Altar. Simple altar in the side chapel of a Gothic church at Jarow, Durham. Above left, altar to an "unknown god" standing on the west of the Palatine Hill, Rome; it dates from about 100 B.C.

Stettin on the rly. to Danzig. A bastion in the defence of Stettin during the Soviet army's drive through Prussia in 1945, it fell, after some resistance, to troops of Marshal Zhukov's 1st White Russian front on March 20.

Altdorf OR ALTORF. Capital of Uri canton, Switzerland. A station on the S. Gotthard rly., it is 2 m. from Fluelen, on Lake Lucerne, and is the legendary scene of William Tell's shooting the apple from his son's head, a tradition commemorated by a bronze statue erected in 1895. In the immediate neighbourhood is Burglen, the traditional birthplace of Tell. Pop. 4,000.

Altdorfer, ALBRECHT (c. 1480-1538). German painter and engraver. After spending his early years at Amberg he returned in

of Eisenach, and was a summer residence of the duke of Saxe-Meiningen. S. Boniface preached here in 724-7, and here Luther was arrested in 1521.

Alternating Current. Electric current which flows or oscillates for a certain time in one direction followed by a flow in the opposite direction. It is produced by an alternator, a thermionic valve generator, or by other means. In one period, or cycle, the current grows from zero to its maximum positive value, falls to zero, reverses its direction, grows to maximum negative value, and falls to zero. The simplest alternating current passes through this cycle of changes in a definite time, e.g. 50 cycles per second in the standard supply system of Great Britain, or 877,000 (877 kilocycles) per second in the 342.1 metre wavelength of the high-frequency radio transmission of the B.B.C. The number of cycles per second is the frequency.

In direct or continuous current circuits the current, or electron flow, is steady and does not vary in magnitude or direction.

An alternator generates single or polyphase alternating currents. Three-phase A.C. is standard in British power stations. This means that three currents are generated, each having separate, overlapping cycles, and each rising and falling to maximum and minimum voltages 50 times a second. The peak, or maximum voltage, of the first phase is

followed by the peak of the second, and this in turn by the peak of the third.

Alternating current (A.C.) is far more economic than direct current for transmitting power over distances for which high voltages are essential, and alternators are more convenient than dynamos for generating high voltages, capacities as high as 33,000 volts (33 kv.) being standard. A.C. is also readily transformed, voltages being raised or lowered by machines (transformers) without moving parts. See Alternator.

Alternation of Generations. Term employed to denote, in the life history of certain plants, the appearance of two distinct generations. These differ considerably in appearance; one having male and female individuals, the other no distinction of plant-sex.

Nearly all plants exhibit true reproduction, that is, reproduction by means of special cells. These cells may be produced in two ways. (1) The reproductive cell may be capable of itself of giving rise to a new individual. This is the asexual method. These cells are called by a variety of names—micro-spores, macro-spores, zoospores, etc. (2) The reproduction may be the result of the union of two specialised reproductive cells, neither of which by itself is capable of giving rise to a new individual. This is the sexual method. In most of the cryptogams or seedless plants, such as ferns, the union takes

place between two cells which differ widely in size and form, and one of which is male (antherozoid) and the other female (oo-sphere). As a consequence of this process, termed fertilisation, the female cell becomes surrounded by a cell wall and is then termed an oospore. In the higher cryptogams it is observable that a reproductive cell, whether produced by the asexual or the fertilisation method, does not give birth to an individual plant similar to the one which bore it. If it be a spore, or asexual, it gives

rise to an individual which bears sexual organs; if it be an oospore, or sexual, it gives rise to an individual with spores.

Thus there appear two distinct generations in the life of one of these cryptogams, of which the first, termed the sporophore, is asexual and bears spores, and the second, termed the oophore, is sexual and comprises plants with the male and female reproductive organs. In a moss, for example, the ordinary moss as we see it is the oophore. The product of the development of its oospore is not similar to the parent plant, but is something quite different from moss, viz. a sporogonium in which spores are formed. Again, when the spore of a fern germinates it does not give birth to a fern with stem and leaves carrying spores, but to a small flattened cellular body having male and female organs. From one of the fertilised oospores of this small cellular body the ordinary spore-bearing fern again reappears. See Cluster-cup; Fern; Fungi; Moss; Prothallus; Rust.

Alternative Vote. Method of voting to secure, so its supporters claim, a fairer expression of the electors' will. See Proportional Representation.

Alternator. Electro-magnetic machine which generates alternating current (*q.v.*), similar in principle to the dynamo in which the A.C. produced is rectified by a commutator to give direct current. As A.C. is almost exclusively used for large-scale electric power and lighting all modern power-station generators are alternators.

An alternator consists essentially of an armature, usually stationary and called the stator, and a field magnet system, usually rotating and called the rotor. The electro-magnets of the field magnet system are excited, that is, magnetised, by direct current from a small dynamo called the exciter. Alternators are driven at standard speed (dependent upon the number of magnetic poles) to give a current of standard frequency (50 cycles). Thus, for two magnetic poles (1 pair, N. and S.) the speed must be 3,000 r.p.m., for 4 poles (2 pairs) 1,500 r.p.m., and so on. High speeds are desirable for efficiency.

The principle of alternator operation is, in simple terms, as follows. Electric current is produced when a conductor (insulated) cuts the lines of force in a magnetic field. To overcome

Alten Fjord. Norwegian inlet used as the base for the German battleship Tirpitz, 1942-44. See p. 348

Alternator. Two of the main turbo-alternators installed in 1939-40 at Battersea Power Station. They generate 69,000 kW

construction problems in alternators the magnetic field (the rotor) is rotated, not the conductors. Current (rising and falling in voltage value 50 times per second) is produced in the conductors of the armature (stator). Direct current from the exciter is led to the rotor (to produce the magnetic field) by brushes which press on slip rings on the rotor shaft. The current generated in the stator is led away direct to switchboards by cables to the mains and external transmission lines. No commutator is required. More than one current can be generated in a cycle according to the number of separate conductors to each pair of magnetic poles. Normal practice employs three conductor systems giving three-phase current. In the overhead transmission systems used all over Britain four lines, or conductors, are seen; one (uninsulated) is the earth line, the other three (insulated) carry the three-phase supply. Polyphase alternators, *i.e.* 4, 6 or more phases, are also employed for certain purposes.

Alternators may be driven by steam engines (slow speeds), water turbines (varying speeds), or steam turbines (high speeds). The last are usually called turbo-alternators and are used in all British power stations since they give high output with high efficiency. In the great Battersea power station of the "grid" system there were in 1946 three turbo-alternators, two each generating 69,000 kilowatts at 3,000 r.p.m., and a third giving 105,000 kilowatts at 1,500 r.p.m. Battersea was designed for a total output of 550,000 kilowatts (or about 50,000 amperes at 11,000 volts). Large turbo-alternators are also installed at Barking, Fulham, Hams Hall near Birmingham, and other stations of the "grid" system. *See* Alternating Current.

Althing. Name of the parliament of Iceland. The Scandinavian word *thing* means an assembly, and is found in storthing and husting. The Althing, or assembly of the elders, dates from the 10th century, but its present form only from 1874, when the king of Denmark gave a constitution to Iceland. It consists of 52 members elected by universal suffrage. The upper house consists of one third of the members elected by the whole Althing in session; the lower house of the remainder. After Germany invaded Denmark, April 9, 1940, the Althing assumed the royal power next day, and on May 16, 1941, terminated the union with Denmark.

Althorn. A brass musical instrument of tenor pitch, the E flat or F saxhorn. The name is also sometimes applied to the baritone saxhorn in B flat.

Althorp. Seat of Earl Spencer. It is 5 m. N.W. of Northampton, 1 m. from Althorp Park rly. stn. The estate has belonged to the Spencers since the time of Henry VII. The mansion dates from the Tudor period, but has been largely altered, in part by the 1st countess of Sunderland, Waller's Saccharissa. The house contains some fine portraits by Gainsborough, Reynolds, Van Dyck, and Lely, and paintings by Holbein, Murillo, Rembrandt, Hals, and others.

Althorp, Viscount. Title taken from a village near Northampton, or from the family seat there (*v.s.*), and used as a courtesy title by the eldest son of Earl Spencer (*q.v.*).

Althorp Library. Collection of more than 40,000 volumes now in the John Rylands Library at Manchester.

Altimeter. Instrument constructed on the principle of the aneroid barometer to register the height attained by an aircraft. It is actuated by a collapsible metal capsule exhausted of air, the shape

of the capsule being altered by changes in the pressure of the atmosphere surrounding it. The face of the capsule is linked, through gearing, to a direct-reading indicating needle. Three capsules may be interconnected to make the instrument more sensitive. Various devices are employed to correct errors due to varying atmospheric pressure at the same height and other causes, and the error of the modern altimeter does not exceed 0.5 per cent at 15,000 feet. *See* Aneroid.

Altissimo (Ital., very high). In music, the octave above alt. Thus C in altissimo is:—

Altitude. In astronomy, the angular height in degrees of a star above the astronomical horizon.

Altkirch. Town in Alsace. It is 17 m. W.N.W. of Basel, on the rly. from Mulhouse to Belfort, has cotton factories and quarries, and trades in grain.

Altmark. German ship of the tanker type. In 1939-40 the Altmark achieved notoriety as a prison ship, satellite of the Admiral Graf Spee (*q.v.*). It was her duty to carry supplies to the Nazi raider, and to take aboard any British survivors of the sinkings. On Dec. 6, 1939, in the S. Atlantic, she relieved the Graf Spee of her last haul of prisoners, and with a total of 299 captives under her hatches headed northwards. Having reached Icelandic waters, she turned south and was sighted off Norway by British aeroplanes on Feb. 16, 1940.

Shortly afterwards the Altmark was intercepted by H.M.S. Intrepid, one of a destroyer flotilla commanded by Capt. Vian of the Cossack, and the British Admiralty ordered that the British ships should enter neutral waters, search the Altmark, and rescue any prisoners found. By this time the German ship, escorted by two Norwegian gunboats, had slipped into Joessing Fjord, a small inlet with a dead end, S. of Egersund. Capt. Vian, in the Cossack, reached the mouth of the fjord, where the destroyer Ivanhoe was standing by, and was here assured by the captain of one of the gunboats that the Altmark was unarmed, had been searched at Bergen, had no prisoners, and had permission to use Norwegian territorial waters.

The British destroyers withdrew, but acting under further Admiralty orders, Cossack re-entered the fjord after dark. By skilful

Altmark. German prison ship cornered in Joessing Fjord. She was identified by the single large funnel aft

handling the Cossack was grappled to the Altmark and a party of two officers and 30 men, leaping on to the enemy deck, drove the German crew before them. There ensued hand-to-hand fighting, in which seven Germans were killed and seven wounded. Meanwhile, the prisoners had been located in locked shell-rooms, store-rooms, and even in an empty oil tank. They were released to the stirring reassurance: "The Navy's here!" and, being taken aboard the Cossack, were landed the following day at Leith.

Altmühl (Ger., old mill). River of Bavaria. Rising 7 m. N. of Rothenburg, after a S. and E. course of about 105 m. it joins the Danube at Kelheim. With the Regnitz and the Ludwigskanal it is part of the waterways linking the Rhine and Danube.

Alto (Ital., high). Musical term used to describe a high male voice, sometimes called counter-tenor. Also the French term for the viola or tenor violin in the string quartet and orchestra. See *Contralto*.

Alto Clef. In music, the C clef used on the middle line of a five-lined staff.

Alton. An urban district and market town of Hampshire, England. It lies 46 m. S.W. from London by railway, and is the centre of a hop-growing and agricultural district celebrated for its ale. The perpendicular church of S. Lawrence suffered in the Civil War and was restored in 1867. The assembly hall, built at a cost of £5,000, was presented to the town in March, 1919, as a victory gift. At Chawton, 1 m. S., Jane Austen lived for eight years. A notable local institution is the Lord Mayor Treloar Cripples' Hospital and College

many manufactures and exports coal, stone, lime, and fruit. Pop. 31,255.

Altona. Town and port in the state of Hamburg, Germany. It is on the Elbe, 13 m. W. by N. of Hamburg, in whose commercial prosperity it shared before the Second Great War. Its extensive docks are included, with those of Harburg-Wilhelmsburg, in the port of Hamburg (*q.v.*) The industries included shipbuilding, iron-founding, brewing, and woollen, flour, tobacco, soap, margarine, chemicals, and glass manufactures.

Alton Locke. Novel by Charles Kingsley, published in 1849 with the title of *Alton Locke, Tailor and Poet*; an Autobiography. Although written with the definite purpose of drawing attention to certain social evils, and less well knit as a story than others of his novels, it remains in some respects Kingsley's finest work in fiction. It was one of the early, and remains one of the outstanding, social studies in fiction form.

Alton Towers. Seat of the earls of Shrewsbury until 1924, now a popular resort. It is at Alton, Staffordshire, England, about 4 m. E.S.E. of Cheadle. The mansion, dating from 1814, was built by the 15th earl, and the magnificent grounds were laid out by Lancelot ("Capability") Brown (*q.v.*). Terrace below

terrace, they stretch to the river Churnet, with temples, grottoes, fountains, and conservatories.

Altoona. City of Blair co., Pennsylvania, U.S.A. It lies at the base of the Allegheny Mts., 115 m. E. of Pittsburgh, on the Pennsylvania Railroad, and is the site of a school of instruction and important locomotive and carriage works belonging to the Pennsylvania Railroad Co. The rly. passing W. from Altoona ascends the Horseshoe Bend in crossing the mts. Pop. 80,214.

Another Altoona, sometimes called Allatoona, is a pass in Georgia, where on Oct. 5, 1864, a battle of the American Civil War was fought. The Federals had here a great store of bread, which the Confederates determined to seize. The former held the place for six hours, when the Confederates withdrew. See *American Civil War*.

Alto Relievo (Ital. *alto-rilievo*, high relief). In art, a term signifying high relief as distinguished from low and middle, according to the degree of elevation from the flat. The term is mainly used of sculpture and carving, but may be applied to other branches of art. In high relief the figures or

Alto Relievo. Panel from the Arch of Titus, Rome, showing Roman soldiers laden with the spoils of Jerusalem. It is a fine example of sculpture in high relief

other parts of the design stand out conspicuously.

Altötting. Town of Bavaria. It is 60 m. by rly. E.N.E. of Munich, and has an old chapel with an 8th century black image of the Virgin Mary, which attracts thousands of pilgrims yearly. In the chapel of SS. Peter and Paul is the tomb of the great German commander, Tilly (1559-1632).

Altranstädt. Village of Saxony. It stands between Merseburg and Leipzig. Here, on Sept. 24, 1706, peace was made between the victorious Charles XII of Sweden and Augustus of Saxony and Poland.

Altrincham. Mun. bor. of Cheshire, England, 8 m. S.W. of Manchester, and served by railways, including the former Manchester S. Junct. and Altrincham rlys. The town is mainly residential and industrial, as well as being an important market-garden centre. A charter naming Altrincham as a free borough was granted in 1290, and a record of mayors since 1452 has been kept. It was incorporated as a mun. bor. in 1937. There are generous open spaces and excellent parks and a municipal golf course. Altrincham and Sale form a county division returning one member to Parliament. Market days, Tues. and Sat. Pop. 39,000 approx.

Altrincham arms

Altruism (Lat. *alter*, another). All action, to quote Herbert Spencer, which in the normal course of things benefits others instead of benefiting self: the opposite of egoism. To live for oneself is the principle of egoism, to live for others the principle of altruism. The term originated with the French Positivist Auguste Comte, who considered altruism to be the indispensable condition of all culture and morality. See Egoism.

Altstätten. Town of Switzerland in St. Gall canton. It is 15 m. S.S.E. of Rorschach, 1,700 ft. high, and has sulphur springs.

Altun Keupri (the Golden Bridge). Ancient town of Irak. Situated on an island in the Lesser Zab river, it is 25 m. N. of Kirkuk. British forces of the First Great War, in their great pursuit of the Turks, drove them across the river here, May 11, 1918.

Altyn-tagh. Range of mts. in Central Asia. It forms in part the boundary between Tibet and Sinkiang. The highest ascertained alt. is 14,000 ft. In this range the wild camel is found.

Aludel (Arab., utensil). Vessel of earthenware or glass formerly used for condensation. Externally

Aludel. Series of three of these earthenware vessels used by old-time alchemists

its shape is similar to that of an Indian club as used in gymnastic exercises. An ancient piece of chemical apparatus, it will be found illustrated in most pictures of alchemists' laboratories. Its

purpose is to condense, on the inside, metallic fumes, produced in the process of distilling the more volatile metals out of their ores. It is used in series as shown in the illustration, between 500 and 600 vessels being connected with one furnace. It has been largely superseded by more efficient apparatus, but is understood to be still used in old works in Spain. See Mercury.

Alum (Lat. *alumen*). White transparent mineral salt consisting of the double sulphate of aluminium and potassium with water of crystallisation ($\text{Al}_2(\text{SO}_4)_3 + \text{K}_2\text{SO}_4 + 24 \text{H}_2\text{O}$). This is the typical alum, but the term is extended to a series of double sulphates of the same general formula. There are, for instance, alums similar to potash alum, except that the potassium is replaced by ammonia, soda, or silver, these being known as ammonia alum, etc. On the other hand, a series exists of double sulphates, also known as alums, which contain no aluminium. Examples of these are iron alum, manganese alum, and chrome alum.

Pliny and Dioscorides describe the varieties and uses of alum. In the 15th century Pope Pius II carried on a famous alum factory at Tolfa, near Civita-Vecchia, Italy, alunite or rock alum being the raw material. Roman alum, or roche alum, is still asked for when a pure alum is desired. The manufacture of alum was introduced into England in the 18th century by Challoner, who discovered a suitable aluminous deposit at Guisborough, Yorkshire.

The raw materials from which alum is made are alunite, otherwise known as alum stone, found chiefly at Tolfa and Solfatara, in Italy, and Puy de Garcey, Auvergne, France; alum shale and alum schist, found at Whitby, Yorkshire, Campsie, Scotland, and other parts of the world; bauxite, and cryolite. The original methods of making alum consisted of weathering the alum stone, burning it in heaps, and then lixiviating the product with water from which the alum crystallised. The modern process is to calcine the alunite at a high temperature and treat the product with sulphuric acid, when both aluminium sulphate and alum result, these being separated from each other by crystallisation; or the whole is converted into alum by adding sufficient potassium sulphate. When potash alum is strongly heated the water of crystallisation

is thrown off, and the product swells up and produces burnt alum. Potash alum only was at first produced, but in 1845 Spence introduced the manufacture of ammonia alum from the refuse shale underlying the coal seams of South Lancashire, Scotland, and elsewhere. One ton of ammonia alum is produced from 15 cwt. of shale. Alum is also made from aluminium sulphate derived from bauxite or china clay.

Ordinary alum is much used for its astringent or drying properties. The largest industrial use of alum is in dyeing, as a mordant or fixer of the colours to the fabric. It must be free from iron. Combined with acetic acid, it forms the red liquor of the dyer. A great variety of solid colours known as lake pigments is made, in which alum is required as the base. It is also used in making shower-proof garments; as a fireproof filling for safes; for fireproofing fabrics and wood; for hardening plaster of Paris; in tawing leather; for sewage purification, and for softening water. In medical practice, alum is frequently used as a mild caustic and astringent.

Alum - bagh. Palace within walled grounds, 4 m. to the south of Lucknow, India. It was converted into a fort by Sepoys in the Mutiny. Their position, which rested on Alum-bagh, was stormed and captured, Sept. 23, 1857. In Nov., 1857, Havelock was buried within the fort, which was held by Outram against the Sepoys until its relief by Sir Colin Campbell, March, 1858.

Alum Bay. Beach at the extreme W. of the Isle of Wight, England, bounded by Hatherwood Point and the Needles (*q.v.*). The cliffs are famous for the multi-coloured strips of sandstone which contrast with the basic white of the chalk. Bagshot beds (*q.v.*) are exposed here.

Alumina. An earthy mineral, chemically an oxide of aluminium (sesquioxide), its formula being Al_2O_3 . It is perhaps the most abundant and widely distributed of the earths. In combination with silica it forms clay; the compound, though commonly reddish owing to the presence of iron, is white when pure, as in china clay used for the production of porcelain. It constitutes a large proportion of slate and of all slaty rocks and shales.

Alumina is derived from the granite rocks, where it is present in combination with silica and potash in the form of feldspar. It is by

the decomposition of the feldspar of granite that the clays and argillaceous soils and rocks have been formed. It occurs in a pure state in the crust of the earth in the forms of the ruby, sapphire, Oriental topaz, amethyst, and other gems, and as bauxite (*q.v.*), principal source of aluminium, corundum, and emery.

When it is precipitated from its solutions, pure alumina is a white, bulky, and amorphous powder. The precipitate possesses a specific gravity of 2.00, though when fused the specific gravity rises to nearly double. It is insoluble in water, but dissolves in most acids and in solutions of caustic soda and caustic potash. It is infusible at ordinary furnace temperatures, but melts under the oxy-hydrogen blowpipe and in the electric arc. The crystalline form is not soluble in acids.

Artificial rubies and sapphires are made by fusing alumina with the appropriate colouring element at very high temperatures. A pure form of alumina is made by strongly heating ammonia alum. Corundum is made artificially by fusing alumina in the electric furnace and allowing the fused mass to cool slowly. Aluminates are formed by the action of alkalis on alumina.

Aluminium (Lat. *alumen*, alum). Aluminium (in America aluminum) occurs in nature only in combined form, chiefly as the silicate (clay, feldspar, etc.) and the oxide and hydroxide (corundum and bauxite). Cryolite, the double fluoride of aluminium and sodium, occurs only in Greenland, but can be produced synthetically. It has been estimated that the earth's crust contains about 8 p.c. of metallic aluminium in combined form, this amount being exceeded only by silicon. Bauxite (*q.v.*) ore is the principal source of supply of the metal, as it is more easily extracted from the hydroxide than from the silicate, but other ores have been used in countries situated far from bauxite deposits, particularly in war-time.

Aluminium (chemical formula Al) has an atomic weight of 26.97 and a specific gravity of about 2.7 in the pure cast state at room temperature, with a melting point of 660° C. approx. Alloying with heavier metals increases the specific gravity slightly and reduces the melting temperature. The thermal conductivity is about half that of silver, and the electrical conductivity about 60 p.c. of that of copper. The specific heat is

very high and exceeded only by magnesium. Commercially pure aluminium, produced by the electrolytic process, has a purity of 99.5 p.c. plus, the chief impurities being silicon and iron, while super-purity aluminium, produced on an industrial scale by double electrolysis, has a purity approaching 99.99 p.c.

Properties of Aluminium

Aluminium, in both pure and alloyed form, is white with a bluish tinge; it has a high affinity for oxygen which results in the immediate formation of a thin transparent film of oxide on the surface when exposed to the atmosphere, which prevents tarnishing and protects the metal from any but strong oxidising agents. This film can be thickened by anodic treatment and such films can be dyed to give permanent decorative effects. The metal is extremely ductile, particularly in the form of annealed sheet, and it can be rolled into thin foil, drawn into fine wire, and pressed into intricate shapes, being exceeded in this respect only by gold. Many of its alloys can be extruded under pressure and temperature to produce long lengths of sections of almost any shape and size.

HISTORICAL. Some controversy has arisen over the exact date when metallic aluminium was first isolated, but it is now generally agreed that it was in 1845 that the German scientist Wöhler, at the university of Göttingen, first succeeded in producing particles of sufficient size to recognize as metal and in sufficient purity to determine its chief properties, using a process based upon the reduction of aluminium chloride with potassium. Nine years later, in 1854, the French chemist H. Sainte-Claire Deville improved upon this process by substituting sodium for potassium, which reduced the cost, while the double chloride thus formed acted as a flux and allowed the metallic globules as formed to coalesce and be cast into ingots. This process, or modifications of it, remained the basis of all the early production of the metal until the simultaneous discovery of the modern electrolytic process in America by Hall and in France by Héroult in 1886. This process depends upon the electrolytic reduction of pure alumina dissolved in a molten bath of cryolite (double fluoride of aluminium and sodium), using carbon anodes and cathodes, the carbon of the anodes being the

actual reducing agent consumed. This process, with slight modifications, is the basis of the modern aluminium industry. The first plant to use it was operated in 1887 in the U.S.A. by the Cowles Electric Smelting and Aluminium Co., and the first in Europe by the Soc. Métallurgique, later in 1887, at Neuhausen in Switzerland. The first use of the process in Great Britain was made in 1890 by the Metal Reduction Syndicate at Patricroft, near Manchester, on a small scale. In 1896 it was developed by the British Aluminium Co. at Foyers, Scotland, on an industrial scale.

MODERN METHODS. The process now universally employed in the aluminium industry is a two-stage one, the chemical extraction of pure alumina from its ore, followed by reduction of the alumina to metallic aluminium in the electric furnace. The first stage, being a purely chemical process involving considerable quantities of heat, is preferably located in proximity to a cheap source of fuel such as a coal mine, while the second stage demands ample supplies of cheap power, which normally means water power. About four tons of bauxite containing 60 p.c. of aluminium oxide (Al_2O_3), or alumina, is required to produce the two tons of alumina needed for one ton of aluminium.

The Bayer Process

The original Bayer process of producing alumina is still the principal one employed. The bauxite, after grinding, is treated under pressure and temperature with strong caustic soda to form a supersaturated solution of alumina in sodium aluminate, with a residue containing the unattacked impurities, chiefly silica, iron, and titanium, with some alumina and soda combined with the silica in the form of insoluble sodium-aluminium-silicate. This loss of alumina and soda to the silica necessitates the use of bauxites low in silica rather than low in iron. After filtering to remove the impurities the sodium aluminate is diluted and run into decomposers where most of the alumina is precipitated as tri-hydrate, which is subsequently calcined at high temperature to the non-hygroscopic form of alumina for feeding to the reduction furnace.

The modern reduction furnace is made of sheet steel lined with carbon which acts as cathode, with carbon anodes suspended from supports and dipping into

the molten bath of cryolite containing about 5 p.c. of alumina. The voltage per cell is 5-7 volts and is so adjusted that under normal working conditions only the alumina is decomposed, though in practice there is an unavoidable small loss of cryolite. A covering of alumina

Aluminium. Diagrammatic section of a reduction furnace, showing arrangement of anodes and cathode

is maintained at the top of the furnace, which is replaced as it becomes dissolved and used up, and the anodes are also lowered periodically as they become consumed. The oxygen of the alumina combines with the carbon of the anodes to form carbon monoxide, which burns to carbon dioxide and escapes, while the molten aluminium thus released falls to the bottom of the furnace and is tapped off.

The carbon required to reduce aluminium oxide to aluminium is supplied by the material of the anode and any impurities in the raw material will find their way into the metal; the leading producers therefore make their own electrodes from special grades of coke. Natural cryolite is found in only one place, Greenland, but can be produced synthetically, and the leading firms have their own plants, if only as a safeguard against interruption of supplies, particularly in war.

USES OF ALUMINIUM. Aluminium, like most pure non-ferrous metals, has relatively poor mechanical properties, though these can be somewhat improved by cold work—rolling, drawing, and pressing. In general, therefore, the pure metal is used for purposes where its chemical and physical properties are of value, chiefly its resistance to corrosion, high thermal and electrical conductivity, light and heat reflectivity, and its affinity for oxygen. When alloyed with other metals, the mechanical properties are very markedly raised, and the alloys therefore find their chief use in fields where light weight combined with high strength is desired, fore-

most among which is the transport industry.

A large number of light alloys have in recent years been developed with characteristics to suit various applications, and most of these are covered by British Standards Institution or Department of Technical Development (Air Ministry) Specifications in Britain. The more important of these are known also by their trade names, such as Duralumin, Silumin or Alpac, Hiduminium, Birmabright, Wilmil, etc., containing varying proportions of different alloying elements, chief among which are magnesium, manganese, copper, zinc, nickel, and silicon. As far and away the highest consumption of aluminium today is in alloyed form, the generic term aluminium is usually taken to cover its alloys.

As the aluminium industry is a new one and new uses are being continually found for the metal, it is difficult to give any but a rough idea of its principal applications, but the following general notes may act as a guide.

Transport. In motor transport the metal is used in the form of castings for engine crank-cases, cylinders and pistons, gear boxes, and numberless fittings, and in sheet form for body work in cars and buses, and for delivery vans. In the aircraft industry the high-strength structural alloys in fabricated form find their chief uses, modern military and transport planes containing upwards of 80 p.c. of light alloys. There is also an increasing use in naval vessels of all kinds, particularly high-speed craft, and much of the superstructure of modern liners is in light metal. Special alloys to resist saline conditions have been developed for this purpose.

Domestic. Aluminium cooking utensils utilise the good heat conductivity and hygienic qualities of the metal and the modern trend for prefabricated kitchens involves extensive use of aluminium. Most food-processing trades use aluminium equipment, and aluminium vessels are used in both process

and transport in the dairy and brewery industries.

Electrical. In this field aluminium competes with copper for almost every purpose, the use of one or the other depending mainly upon the relative prices of the two metals—when aluminium is less than twice the price of copper it can in general compete. The biggest uses are for bus-bars and overhead transmission lines, but anodically insulated aluminium wires are also used for magnet windings.

Machinery. There is a somewhat limited but increasing use of aluminium for machines of all kinds, chiefly portable tools and transportable machinery, where weight reduction is desirable.

Building. Anodised and coloured window frames, panels, handrails, handles, and a host of fittings are made of aluminium, and complete prefabricated houses of aluminium have been built. Aluminium foil (Alfol) is also used for insulation and aluminium powder for paint.

Chemical. Large vessels, welded out of aluminium sheet, are used in chemical plant of all kinds.

Metallurgical. Aluminium is used as a deoxidising agent for steel and some non-ferrous metals and as a grain-refining agent in certain classes of steel. It is also used in the aluminothermic reduction process for the production of carbon-free ferro-alloys.

Miscellaneous. Among miscellaneous applications may be mentioned condensers and earthing shields in wireless equipment, parts of cameras, field glasses and scientific instruments, and military equipment of all kinds where light weight is of importance.

HEAT-TREATED ALLOYS. Most modern aluminium alloys owe their mechanical properties, high strength combined with good ductility, to some form of heat treatment, involving in many cases the phenomenon known as age-hardening, which was discovered by the German Wilm in 1908 and led to the development of the Duralumin series of structural alloys. This involves heating to about 500° C., quenching

WORLD PRODUCTION OF ALUMINIUM (in thousands of tons)

in water, and allowing to stand for several days, during which the full strength is developed. This phenomenon is more or less peculiar to light alloys—aluminium and magnesium.

Bibliography. Aluminium Bronze. Alloy of copper with up to 14 p.c. of aluminium, usually 10 p.c., and small additions of other metals to give special properties or to improve working qualities. The mechanical properties are comparable with steel and can be varied over a wide range by adjustment of composition, by degree of working, and by heat treatment. The alloy is highly resistant to attack by most corrosive media, including mineral acids. This is attributed to the formation of a protective film of aluminium oxide on the surface under service conditions. It is extremely hard, and both hardness and strength are maintained to a marked degree at high temperatures. The pleasing appearance, akin to that of gold, is made use of for architectural purposes and for imitation jewelry. The most important uses are in marine engineering (e.g. ships' propellers) and for the parts of acid pumps and other plant. It is also used for the valve seats and guides of internal combustion engines, for sparking-plug bodies, and for heavy-duty bearings and gear wheels. The extreme hardness makes it useful in non-sparking tools, though beryllium bronze is beginning to supplant it for this purpose. It may be cast, forged, rolled in sheet or drawn as wire. The standard 10 p.c. alloy has a specific gravity of 7.5 and a melting point of approx. 1,000° C. The tensile strength of castings varies between 20 and 30 tons per sq. in., and of sheet between 30 and 35 tons per sq. in., according to composition and heat treatment. Cold-drawn wire and sections can be supplied with tensile strengths up to 60 tons per sq. in.

In France and the U.S.A. considerably more use has been made

of aluminium bronze than in Great Britain, though most of the early development work was carried out in this country. The electrical conductivity of aluminium bronze, though low compared with that of copper and aluminium, is materially higher than that of any ferrous alloys with comparable strength.

Aluminium bronze was produced direct in the electrolytic furnace by the Cowper-Cowles process before aluminium was thus produced.

Aluminium Salts. Three hydrated oxides are known, and of these the native forms diaspore and bauxite are the most important, being the source whence other salts of aluminium are prepared. Alumina (*q.v.*) forms with sodium and potassium hydroxide the salts known as aluminates. Sodium aluminate, NaAlO_2 , is prepared from the solution obtained in the alkaline extraction of bauxite. It is used in dyeing and calico printing.

Aluminium chloride, AlCl_3 , is a white crystalline solid now made on a large scale from bauxite, coal, and chlorine. It is largely employed in preparing organic compounds and as an antiseptic and astringent. Aluminium bromide and iodide also find uses in organic chemistry. Aluminium sulphate occurs native and is also made from bauxite and china clay. A special grade is supplied for water purification purposes.

Alum Root (*Heuchera americana*). Perennial herb of the large family Saxifragaceae. A native of North America, it has clammy, hairy stems, and long stalked, lobed and toothed, roundish leaves. The reddish flowers form a lengthened cluster. The root is very astringent; hence the name. The name is also applied to the spotted crane's-bill (*Geranium maculatum*), a N. American herb with roots so astringent that they are used instead of kino (*q.v.*).

Aluta, ALT or OLTU. Tributary of the Danube. Rising in Transylvania, on the N.W. slope of the Carpathians, it flows through the Roter Turm pass into Rumania, goes through Wallachia, and finally enters the Danube opposite Nikopolis. Its length is about 315 m. and it is too rapid for navigation. The upper portion of the valley is the home of the Szeklers, a people akin to the Magyars. Heavy fighting between Rumanian and German forces took place in the valley in the autumn of 1916. See Rumania.

Alva. Police burgh of Clackmannanshire, Scotland. It stands under the Ochil Hills, 7 m. E.N.E. of Stirling by the L.N.E.R., and has large woollen factories, and specialises in tartans, shawls, and tweeds. Bricks are manufactured. Close by is the Alva Glen, noted for its waterfall. Pop. 4,853.

Alva, FERNANDO ALVAREZ DE TOLEDO, DUKE OF (1508–83). Spanish soldier. He became a soldier when very young, and

Duke of Alva. Spanish soldier, governor of the Netherlands under Philip II
Antonio Moro

showed marked ability and courage in the early wars of the Emperor Charles V. Later he was made commander-in-chief in Italy, but it was not until he was sixty that he entered upon the work which gave his name its prominence.

In 1567 Philip II of Spain appointed Alva to the governorship of the Netherlands, which were seething with revolt—partly political, against the subversion of their constitutional liberties; partly religious, against the stern tyranny of the Inquisition. Alva, a capable soldier, had only one idea of government, to crush every form of opposition by force of arms. His immediate appointment of an arbitrary court of justice and the sternness of its procedure at once kindled open rebellion. In 1568 a detachment of Alva's Spaniards was defeated by a force of the insurgents at Heiligerlee. Alva at once seized and executed Count Egmont and Admiral Horn, leaders who had endeavoured to check the outbreak of violence.

Then he himself took the field, and a reign of terror began. He showed his political incapacity by imposing taxes which would have ruined the commerce of the Netherlands and destroyed

the great wealth wherein lay their value to his master. Not until the trade of the Netherlands was on the brink of destruction were these taxes abandoned. Alva believed that the Netherlands were helpless and that revolt had been crushed, when suddenly in 1572 it again blazed out. The towns of the northern provinces closed their gates to the Spaniards; in the S. the insurgents captured Mons. Though Mons itself and other towns in succession were compelled to surrender, Alkmaar held out defiantly and the Spaniards were obliged to retreat.

Alva, now conscious that victory won by force would be barren, urged his own recall, and in 1573 his place was taken by the more politic Requesens. Alva went into retirement, from which he emerged in 1580 to compel the submission of Portugal to Philip. He died at Thomar, Jan. 12, 1583. The 17th duke of Alba (*q.v.*), Spanish ambassador to Great Britain 1939-45, was a direct descendant. *Consult* Rise of the Dutch Republic, J. L. Motley, 1856.

Alvarado. Seaport of Mexico. It stands on the Bay of Campeche, at the mouth of the Alvarado river, 38 m. by rly. S.E. of Vera Cruz. Pop. 8,000.

Alvarado, PEDRO DE (c. 1495-1541). Spanish soldier and adventurer. Born at Badajoz, in early life he went to America, and in 1519 was one of the leaders in the expedition under Hernando Cortes for the conquest of Mexico. He remained there as governor after the conquest, and later became governor of Guatemala.

Alverstoke. Seaside resort of Hampshire, England, 1 m. S.W. of Gosport, between the Solent, Spithead, and Haslar Lake. Originally intended as a spa, it has some Georgian architecture and has been a favourite place of residence for naval men. There are fortifications in the district, and eastward is Haslar naval hospital, built 1746-62, with accommodation for nearly 2,000.

Alverstone, RICHARD EVERARD WEBSTER, VISCOUNT (1842-1915). British lawyer and politician. A son of Thomas Webster, Q.C., he was born Dec. 22, 1842, and educated at Charterhouse and Trinity College, Cambridge. In 1868 he became a barrister, and in ten years a Q.C. In 1885 he entered the House of Commons as M.P. for Launceston, and was attorney-general in the short-lived Conservative government of that year. He held the same

position from 1886-92 and from 1895-1900, during which years he represented the Isle of Wight. In 1900 he was made Master of the Rolls, but on the death of Lord Russell of Killowen in that year was transferred to the Lord Chief Justiceship, which he retained until 1913. He died Dec. 15, 1915, and, as his only son predeceased him, his barony, dating from 1900, and viscounty, dating from 1913, became extinct.

He conducted the case for The Times before the Parnell Commission, and he represented Britain in the Bering Sea and Venezuela arbitrations. In 1903 he was president of the court appointed to decide the boundaries of Alaska.

Alves, FRANCISCO DE PAULA RODRIGUES (1848-1919). President of Brazil. Born in São Paulo, he was a deputy under the Empire. He was president of São Paulo, 1898, of the United States of Brazil from 1902-6 and 1912-16, and was again elected president March 3, 1918, but resigned in the following Nov. through ill-health. The first to be elected president twice, he was largely responsible for stamping out yellow fever and effected important improvements in the city of Rio de Janeiro, where he died, Jan. 15, 1919.

Alvinczy OR ALVINZI, JOSEPH, BARON VON (1735-1810). Austrian soldier. His first experiences of warfare were gained during the Seven Years' War. From 1790-3 he served in the Netherlands, and in 1796 was chosen to lead the Austrian army in Italy, where Napoleon defeated him at Arcola in 1796 and at Rivoli in 1797. In 1808 he was made a field-marshal. He died Nov. 25, 1810.

Alwar. State of Greater Rajasthan, India. It was founded in 1775 by Pratap Singh from estates in Jaipur territory, and attained its present dimensions of 3,158 sq. m. under his successor, who supported the British in the Mahratta War in 1803. Millet, gram, barley, cotton, and wheat are produced; copper, iron, lead, and marble are worked, and weaving and paper-making are carried on. The vernaculars are Rajasthani and W. Hindi. Pop. 823,055.

Alwar. Capital of Alwar state, Rajasthan, India. Situated on the Rajputana-Malwa rly., 98 m. S.W. of Delhi, it is built on rising

ground, its walls are pierced by five gateways, and it is dominated by a fort placed on a conical rock 900 ft. high. Its buildings include the royal palace, a jewel house and armoury, the mausoleum of Bakh-tawar Singh, the tomb of Fateh Jang, and several large mosques. Pop. 44,760.

Alyth. Town and police burgh of Perthshire, Scotland. It is 23 m. N.W. of Dundee, with a rly. station, and has manufactures of woollens, linen, and jute. In the neighbourhood are the remains of a British camp. Pop. 2,629.

Amadavat (*Estrelida amadava*). Bird of the family Ploceidae (Weaver-birds) of the order Passeriformes. It is a native of E. Asia, and is sometimes called avadavat. It is a seed-eater, with a conical beak like that of a sparrow, but of blood-red colour. In the mature male, the head and underparts are bright crimson dotted with white. The feathers of the back are dark grey margined with red and tipped with white. The female, which is considerably smaller, is grey, dotted with white; pale sulphur-coloured beneath. It is extensively kept as a cage bird on account of its fine colour and pleasant trilling song.

Amade, ALBERT GERARD LEO D' (1856-1941). French soldier. The son of Adolphe d'Amade, military intendant, he was born at Toulouse, Dec. 24, 1856, and was educated at La Flèche and at the lycée of Lorient, Morbihan. He entered the French army as a lieutenant of Algerian infantry at Constantine, Oct. 1, 1876. Military attaché at Peking, 1887-91, and military attaché with British Headquarters in the S. African War, he was promoted colonel in 1903 and was military attaché in London, 1903-6. Advanced to the rank of general in 1907, he commanded the French forces in the operations in Morocco, 1907-9. In 1914 he became a member of the Conseil Supérieur de la Guerre, and on the outbreak of the First Great War was in charge of the mobilisation of the Army of the Alps. Later he commanded a group of territorial divisions operating in the N. of France. In April-May, 1915, he led the French troops in Gallipoli. He died Nov. 11, 1941.

Amadeus. Salt lake in the S.W. of Northern Territory, Australia. Except on rare occasions there is nothing but a thin crust, about half an inch of salt, in the lake bed, which is about 200 m. long and of varying width. It was discovered in 1872 by Ernest Giles.

Alves
Elliott & Fry

Amadeus (Lat. *amare*, to love; *Deus*, God). Christian name. In its Italian form of Amadeo, it has been borne by many counts of Savoy. In English it is represented by the now rare Amyas or Amias; in French, by Amédée.

Amadis of Gaul. Hero of ancient romance, and title of one of the most famous romances of chivalry in which he mainly figures. The authorship is generally credited to Vasco Lobeira (d. 1325), who is said to have written the first four books of the work in Spanish, the other eight books being added by later writers. The work was re-shaped at the end of the 15th century by Ordoñez de Montalvo. Some authorities believe that Lobeira took his theme from a lost French original.

The story may be summed up as a brilliant imitation of the tales of the Arthurian cycle. Amadis of Gaul was followed by Amadis of Greece and other countries. The romance is purely fictitious. The best English version is by Robert Southey, 3 vol. ed., 1872; abridgments by N. J. Davidson, 1911, and S. R. Littlewood, 1915.

Amager. Island of Denmark. It is separated from Copenhagen on the southern end of Zealand by the Sound. Christianshavn, a suburb of the capital, is in the N. Amager is 9 m. long by 5 m. broad, with an area of about 25 sq. m. Low, flat, and fruitful, with large market gardens, it has several small towns, including Dragør. Pop. 26,000.

Amakuru. River of S. America. Above Issokoro it forms part of the boundary between Venezuela and British Guiana; it enters the sea on the S. shore of the Great Mouth of the Orinoco.

Amaldar (Arab. *amal*, office; Pers. *dar*, holder). Indian term for the holder of any post or office. It is applied, for example, to agents, factors, managers, collectors of revenue, and governors of districts.

Amalekites. Powerful and warlike nomad tribe who contested the passage of the desert south of Canaan with the Israelites (Ex. 17; Num. 14). Intermittent warfare went on for many generations between Israelites and Amalekites, until the latter were finally smitten by the Simeonites under Hezekiah (Judg. 6; 1 Sam. 15; 1 Chr. 4). In Balaam's prophecy (Num. 24) the Amalekites were called the first of the nations. According to Arab tradition they came from the Persian Gulf.

Amalfi. City and seaport of Italy, in Salerno province. Situated on the Gulf of Salerno, 23 m. S.E. of Naples, it is noted for its fine coast scenery and magnificent trees and gardens. Its antiquities include the 11th century cathedral of S. Andrea and a 13th century Capuchin convent. In the Middle Ages it was an important republican centre for eastern trade, giving a code of maritime laws to the Mediterranean traffic. The town was sacked by the Pisans in 1138 and never recovered its maritime importance. Masaniello (1622-47, *q.v.*) was born here. Soap, paper, and macaroni are manufactured. Pop. 7,472.

Amalfi figured in the intense fighting between Allied and German forces that followed the full-scale landings on the beaches at Salerno by the Anglo-U.S. 5th army on Sept. 9, 1943. By Sept. 13 Amalfi marked the western extent of the new Allied front, the eastern extremity being at Eboli. From

this line the German army withdrew, after bitter resistance, in the direction of Naples.

Amalgam. In metallurgy, a mixture or solution of mercury (quicksilver) with another metal. Examples include gold amalgam, silver, copper, and sodium amalgams. The term used by 13th century alchemists was amalgama.

Certain amalgams are of importance in the arts. One of tin and mercury is used for silvering mirrors in proportions of about three of mercury to one of tin; another, for silvering glass balls, contains a little lead and bismuth in addition to tin. Silver amalgams are used for silvering and gold amalgams for gilding; while other uses are found in connexion with the rubbers of frictional electric machines and in electric batteries where zinc plates or rods are amalgamated to prevent too rapid waste. The curious Tree of Diana is formed by mixing mercury with a solution of nitrate of silver in a glass bottle. Most amalgams are loose combinations from which the quicksilver may be easily separated by heat and often largely by simple pressing; others appear to be true chemical compounds.

Two or three native amalgams are known. One of silver occurs in the form of crystals in the quicksilver mines of Moschellandsberg, in Bavaria, its composition being 36 p.c. of silver and 64 p.c. of mercury; another, of somewhat similar character, containing 87 p.c. of silver and 13 p.c. of mercury, is found in the province of Coquimbo, Chile, and one of gold in the platinum regions of British Columbia. See Amalgamation; Metallurgy; Gold; Silver.

Amalgamated Press, THE. The origin of what is now the largest publishing enterprise in the world may be ascribed to the year 1888, when the founder of the firm, Alfred C. Harmsworth (later Viscount Northcliffe), issued the first weekly number of *Answers to Correspondents*. He was soon joined by his brother Harold Harmsworth (later Viscount Rothermere), and within a year *Answers*—the other words having soon disappeared from its title—had achieved an immense circulation. Other periodicals and magazines were launched with no less success, and by 1896 the registered capital of Harmsworth Bros., Ltd., was £1,000,000. The name, Amalgamated Press, was adopted Dec. 1901, and in later years the growth of the business has known no abatement; new fields of journalism have been opened by its enterprise, and all forms of entertaining and

Amalfi. View of the beautiful Italian city on the Gulf of Salerno, south-east of Naples. In the Middle Ages it was a Republic

instructive periodicals issued by The Amalgamated Press have met with the ready approval of the reading public. In 1939, 126 different publications, chiefly weekly journals, were being produced by the firm, their aggregate circulation amounting to many millions, and one or more of these periodicals enters every home in the U.K.

Northcliffe retired as chairman in 1915 and was succeeded by Sir George Sutton, Bart. The Fleetway House was erected in 1912, at a cost of £128,000, to accommodate the ever-growing editorial and commercial staffs. Further expansion has taken place since 1927 with Viscount Camrose as chairman.

In 1926 the periodicals and magazines formerly published by Messrs. Cassell & Co. were acquired, and in 1928, in order to provide additional editorial and business offices, leases were taken of John Carpenter House and Tallis House.

The company controls the Imperial Paper Mills Ltd., at Gravesend, with frontages to the river Thames and quay accommodation for vessels up to 8,000 tons. A large proportion of the supply of raw material, i.e. wood pulp, is ensured by the company's controlling interest in the Gulf Pulp & Paper Co., Clarke City, Quebec, which holds over 1,000 square miles of timber land. In 1938 the company acquired a controlling interest in Kelly's Directories. The old-established fashion-publishing business of Weldon Ltd. was purchased in 1941.

Amalgamation. Process of extracting gold or silver from sands or crushed ore by the aid of mercury. The cyanide processes are now most largely used in the recovery of gold and silver, but amalgamation is combined with,

Amalgamation (Fig. 1). Part section of riffled table used in gold extraction

or used in addition to, cyaniding in crushing rock or washing in alluvial deposits. Mercury combines with gold, silver, and other metals in the cold, forming amalgams.

In the recovery of gold from crushed rock by amalgamation mercury is generally put directly into the mortars of the stamp mill, while copper plates, which have been rubbed with quicksilver, are often inserted in the mortars. As the ore becomes sufficiently crushed, it is washed from the mortars by

water and discharged on to inclined tables fitted or formed with riffles, which are essentially ridges running across the table. A partial section of such a table is shown in Fig. 1, which represents the simplest form of amalgamating machine. The upper surface of this table is generally formed of amalgamated copper plates, while free mercury is poured into the riffles. As often as required, the mortar plates and the riffles or tables are changed, and the gold amalgam is removed.

Amalgamation is used later in special machines to recover the gold which has escaped the battery tables. One such special machine, the Attwood, is shown in Fig. 2, *a*, *a'* being troughs containing mercury; *b*, *b'* paddle wheels which revolve so as just to skim the surface of the mercury, *c* a heap of sand or crushed ore, and *d* a pipe which admits of adjustment. This pipe discharges a stream of water, automatically regulated, upon the ore and washes it down upon the mercury in the troughs. As the ore progresses from trough

Amalgamation (Fig. 2). Attwood machine, used in recovering gold

to trough, amalgamation of the gold with the mercury takes place. The gold amalgam formed is removed from time to time and fresh quicksilver introduced.

The essential features of the Knox amalgamating pan are shown in Fig. 3. This pan takes very much the lines of a common mortar mill; *a* being a false bottom fitted into the pan, leaving a partial space between it and the pan bottom proper. Radial grooves are formed on the upper face of this false bottom and filled with

quicksilver; *b*, *b* are iron runners attached through the medium of wooden blocks *c*, *c* to the yoke *d*, by means of which the runners are rotated. The pan is filled up to a certain level with a pulp of crushed ore and water, while quicksilver is added and the runners are set in motion. At the proper moment steam is introduced under the false bottom and the contents of the pan is heated. After thorough incorporation the amalgam formed is run off through an opening in the side of the pan. Finally, the whole contents is discharged for complete separation. The Wheeler pan is an improved form of apparatus on similar lines. Other machines in use are the Molloy hydrogen amalgamator, in which

Amalgamation (Fig. 3). A section of the Knox amalgamating pan

Amalgamated Press headquarters. The Fleetway House, on the east side of Farringdon Street, London

nascent hydrogen is employed to prevent oxidation of the mercury; the Bazin centrifugal pan, and other forms of shaking or rubbing tables. Fine particles of gold which escape amalgamation are extracted by the cyanide process.

The success of the process of amalgamation depends upon maintaining the quicksilver in a clean condition, and chemicals are employed according to the condition and character of the slimes to prevent the fouling of the mercury. The mercury is distilled off from the gold or silver. See Metallurgy; Gold; Silver; Mercury.

Amalia, ANNA (1739-1807). Duchess of Saxe-Weimar. Daughter of Duke Charles of Brunswick-Wolfenbuttel, she became the friend of Goethe, and held a brilliant court at Weimar. In 1756 she married Duke Ernest Augustus of Saxe-Weimar, from whose death in 1758 until 1775 she acted as regent for the young duke, Charles Augustus. Under her rule and that of her son, Weimar was the literary centre of Germany. Consult Life, F. A. Gerard, 1902.

Amaloy. Substitute for platinum, composed of nickel, chromium, tungsten, etc. It is suitable for electrical contacts in railway signals where the voltage is low, and for dental work.

Amals. Leading family among the Ostrogoths, from which their kings were chosen. Theodoric the Great belonged to this line, and the name was attached to several of its members. Consult The Goths, H. Bradley, 1888; Italy and Her Invaders, T. Hodgkins, 1896.

Amalthea. In Greek mythology, daughter of Melisseus, king of Crete. She reared the newly-born Zeus on goat's milk, and as a reward the god gave her the horn of the goat, with the assurance that all her wants should be supplied by it. In another story Amalthea is the Cretan goat itself, which Zeus out of gratitude placed among the

stars. The horn of Amalthea, known as *cornu copiae*, the horn of plenty, as a symbol of abundance and prosperity, frequently appears on coins of the Roman emperors.

Amana. Town of Iowa, U.S.A., 20 m. by rly. S.W. of Cedar Rapids. A German religious community, known as the True Inspiration Society and founded in Württemberg, settled here in 1855.

Amanita (Gr. *amanitai*, fungi). Genus of white-spored agarics distinguished by a sheathed base, and a "ring" or frill just under the cap. With some three exceptions, all are deadly poisonous and are generally responsible for fatal cases of "mushroom" poisoning. The most familiar is probably the fly-agaric (*A. muscaria*), with a vivid scarlet cap covered with white spots, and abundant in birch and pine woods. *A. rubescens* is the only common edible species.

Amann, MAX (b. 1891). German Nazi publisher. Hitler's company sergeant-major in the First Great War, he was made secretary to the Nazi party in 1921, and became one of the most influential Nazi leaders as president of the national Press Chamber. As director of the combine owning most of the party and "acquired" newspapers and periodicals and publishing all books by Hitler and Goebbels, he was in effect Hitler's partner and business manager.

Ama-no-hashidate. One of the most celebrated sights of Japan. It is a sand-bar, similar to the Baltic Nehrungs, completely covered with pine trees, and is a scenic gem when viewed from

the tops of any of the neighbouring hills. The bar separates Iwataki bay from Miyazu bay in the S.W. corner of Wakasa bay, on the Japan Sea. It is about 2 miles in length, with a breadth of 75 yds., is almost 100 miles due north of Osaka, and is reached from that city by rail to Marzura and then by ferry or rickshaw to Miyazu.

Amanullah Khan (b. 1892).

Ameer, later king of Afghanistan. Third son of Ameer Habibullah Khan (*q.v.*), he was born June 1, 1892, and became the legal reigning Ameer on the assassination of his father, Feb. 20, 1919. For a brief period his uncle Nasrulla Khan overthrew the Kabul government and held supreme power, but Amanullah was soon recognized as king. In that year Afghan troops invaded India, and after some fighting Amanullah made overtures to the Indian government, and a peace treaty was signed in Aug. by which Afghanistan became independent. Much interest was created by the prolonged tour of the king and queen of Afghanistan in 1928, in the course of which they visited Egypt, Italy, France, the U.K., Germany, and Russia. His attempts to modernise Afghanistan on the lines of Kemalist Turkey aroused strong opposition, and a conservative revolt aroused by the mullahs forced him to abdicate, Jan. 14, 1929. From India he proceeded to Italy, where he was reported to have become a protégé of the Axis.

Amapala. Free port of Honduras, on the Pacific coast. It is on Tigre Island, in the Gulf of Fonseca, about 950 m. N.W. of Panama. The roadstead was opened in 1868. Exports include silver, coffee, and hides.

Amara. Town of Iraq. On the Tigris, 130 m. above Basra by the river, it is the largest town between Basra and Bagdad, and gives its name to a district with a pop. of 264,508. Illus., p. 358.

Amara, BATTLE OF. Fought between the British and the Turks, May 31-June 4, 1915. In May, 1915, Gen. Nixon, in command of the Mesopotamia expedition, ordered an advance from Kurna on Amara, the force, which consisted of about 14,000 men, being commanded by Gen. Townshend. On May 31 Townshend attacked the Turks, entrenched on two groups of islands, one 3 m. behind the other, in the Tigris above Kurna. By noon the first group of islands was taken.

When next day the British advanced to the second group of

Amanita. A. virosa, a venomous toadstool

Ama-no-hashidate. This narrow spit of land running into the sea off the coast of Honshu is one of the more famous of Japanese scenic beauties

islands they found the Turks had fled. The flotilla steamed on, but on June 2 the water proved too shallow for the larger vessels. The smaller craft sailed up the river, and on June 3 General Townshend on the Comet, accompanied by three armed tugs, pushed on to Amara, where he surprised and forced 700 Turks to surrender. On June 4 he occupied the town. The British took 1,800 prisoners and 17 guns, and captured or sank several enemy vessels.

Amaranth (Greek *amarantos*, unfading flower). Genus of the family Amaranaceae, consisting of annual herbs found in tropical

high, it is the loftiest summit of the Maiella range of the Apennines.

Amoryllidaceae.

Amoryllidaceae. The wild daffodil

white storage leaves. The flowers, which are borne on leafless stems

important family of flowering plants including more than 60 genera. Many forms are bulbous, the bulb being a shortened stem bearing green foliage and

above the perianth. While a few species, such as the daffodil (*Narcissus*) and snowdrop (*Galanthus*), are common in the N. of Europe, the order is more characteristic of warm and tropical regions, especially of S. Africa. Apart from the species with perennial stems, like Agave (*q.v.*), the period of vegetative and floral activity is brief, and in hot countries follows the rains. During drought the plant is preserved underground in the bulb, which is usually protected against rodents and other enemies by possessing emetic, narcotic, or poisonous properties. Between 600 and 700 species are known.

and warm countries. Individually the flowers are small, but conspicuous by being crowded in long racemes. They have no petals, but the sepals are coloured, and, being of a chaffy consistency, retain their form and colour for a long period, which has made them

popular as garden plants. Love-lies-bleeding (*Amarantus caudatus*), prince's-feather (*A. hypochondriacus*), and *A. tricolor* are familiar ex-

Amaranth

amples, the last with richly variegated leaves of crimson, yellow, and green.

Amarapura, OR THE CITY OF THE GODS. Former capital of Burma. It is on the left bank of the Irawadi, a few miles S.W. of Mandalay. Founded in 1783, of its former prosperity few signs remain. It was the capital 1783-1823 and again from 1837 until it fell into decay under King Mindon, who in 1860 transferred the seat of government to Mandalay.

Amarapura was overrun by the Japanese in their advance through Burma in April, 1942, but was cleared of the invaders by troops of the British 14th army shortly after the heavy fighting for Mandalay had driven the Japanese from this region, in March, 1945.

Amaro. Mt. of Italy, S.E. of the Gran Sassa d'Italia, and 9,170 ft.

Amoryllis. Name of a shepherdess in the pastoral poems of Theocritus and Virgil, used generally for a rustic sweetheart or village beauty.

Amasa. Son of Ithra and Abigail, sister of David (2 Sam. 17). He commanded Absalom's army and was defeated by Joab (2 Sam. 18). Pardoned by David, he became successor to Joab, who slew him treacherously (2 Sam. 20).

Amasia, OR AMASYA. Ancient town of Asiatic Turkey, capital of the vilayet of the same name. Situated on the Yeshil-Irmak, it was the residence of the kings of Pontus and the birthplace of the geographer Strabo. It is a terminus of one of the chief roads in Anatolia, by which it is connected through the

Amara, Iraq (p. 357). Wharf showing some of the flat-bottomed river vessels. In centre: Arabs on the Tigris. Top: The bridge of boats across the river

(scapes), are six-partite, with no distinction between sepals and petals. In some respects similar to Liliaceae, there is an obvious difference in the flowers, those of the Amoryllids having the ovary below and those of the lilies having it

coast ranges to Samsun. It has large fruit gardens, orchards, and mulberry plantations, and exports silk, silver, copper, and salt. Pop. (town) 61,000; (vilayet) 136,029.

Amasis. Name of two Egyptian kings. See Aahmes.

Amateur (Lat. *amator*, lover). One who practises or indulges in a sport, pastime, or profession for pleasure and not for monetary gain or consideration. The term is used colloquially for a dabbler, as opposed to earnest worker.

In sport, the amateur is the antithesis of the professional, and the growth of public interest in games led to trouble regarding the status of the two classes. The general tendency was for the professional to oust the amateur, and there was much veiled professionalism. In general, in Great Britain the distinction between amateur and professional is sharply drawn and as sharply maintained. In first-class cricket amateur and professional play in the same team with no further distinction than separate dressing-rooms, sometimes separate entrances to the playing-field, and (until 1946) the use of the amateur's initials on the score card. In Rugby football the amateur, after a bitter struggle, succeeded in keeping the game in his own hands, except in the Rugby League, but in the Association game the amateur has almost disappeared from the leading clubs. In athletics, lawn tennis, rowing, golf, billiards, boxing, etc. amateurs do not compete with professionals. (The open golf championship provides an exception.) In horse-racing gentlemen riders are sometimes granted licences to ride on equal terms with professional jockeys, but they must not receive remuneration. The duty of maintaining the unpaid position of the amateur rests upon the governing bodies of the sports.

In the U.S.A. professionalism is confined almost exclusively to boxing, cycling, wrestling, baseball, lawn tennis, and horse-racing. It was found necessary to prevent freshmen from representing universities, as many men of athletic renown were sent up merely to increase the sporting prestige of the institutions. The line is not drawn quite so strictly in the U.S.A. and in the British dominions as in Great Britain, and occasionally friction has arisen because men regarded as amateurs at home have been considered professionals in England. See Professionalism.

Amateur Athletic Association. The governing body of all amateur athletic sports held in Great Britain. It was inaugurated at Oxford, April 24, 1880, to take over the work which the Amateur Athletic Club, founded in 1866,

had failed to carry out. More than 200 clubs are affiliated, and as many more hold meetings under permits from the governing body and under its regulations. The headquarters are at 118, Chancery Lane, W.C.2. See Athletics.

Amateur Boxing Association. Body founded in 1880 to encourage and control amateur boxing in Britain by the establishment of rules and the promotion of contests. More than 600 affiliated groups exist, and there are large regional areas which practically govern themselves. The headquarters are at 69, Victoria Street, S.W.1.

Amateur Theatre, THE. In England the production and acting of plays by groups or societies of amateurs has long been a popular pastime. That the art flourished as long ago as Shakespeare's day is evident from the picture of the "rude mechanicals" of *A Midsummer Night's Dream*, where Bottom and his companions boisterously rehearse and perform the farcical-tragedy of *Pyramus and Thisbe*. A later age claimed aristocratic devotees of the amateur theatre, a form of acting that grew out of the masque fashionable at court during the reign of James I. Amateur actors from the nobility sometimes took part in professional productions during the 18th century, though this was by no means common, the professional stage being regarded as a place swarming with "vagabonds and adventurers." Jane Austen, in *Mansfield Park*, shows the fashionable type of amateur actor and the kind of plays in which he appeared at the beginning of the 19th century—plays which resembled ambitious charades given in drawing-rooms to an intimate circle of friends.

Love for the art has often been bred in youth through participation in the "school play," traditionally though not invariably consisting of scenes from Shakespeare or Sheridan, classical plays in Latin, or plays in some modern language, thus combining amusement with instruction. Dramatic "readings," first introduced during mid-Victorian times, doubtless provoked interest in actual stage productions. Charles Dickens was an enthusiastic amateur actor, who had a private theatre built in his own home.

In the early years of the present century, amateur societies flourished in most towns of the United Kingdom, but their productions were mostly imitations of popular

professional productions, and usually demanded a certain forbearance on the part of their audiences, though various charitable organizations were able to derive benefit. Between 1919 and 1939, however, the interest in amateur theatricals was greatly extended and strengthened, becoming a self-conscious social movement with a significance of its own chiefly independent of that of the professional stage. The movement spread not only in large towns and cities, where discriminating audiences learned to encourage unusual "non-commercial" productions and different styles of acting, but reached villages and hamlets. Notable work was done by the British Drama League, founded in 1919. The object of this organization was to develop and encourage the art of the theatre in its more serious aspects, and to promote a right relation between the drama and the community. By 1939 some 5,000 dramatic societies were affiliated to the British Drama League. Competitions and summer festivals were held in different parts of the country, towns and villages competing against one another. The Scottish Community Drama Association fulfilled a similar function in Scotland. The National Operatic and Dramatic Association (N.O.D.A.) also did useful work, covering as its name implies, a somewhat wider field. The Village Drama Society was incorporated in the British Drama League in 1931, and the Women's Institutes also took up the cause.

Little Theatres

The Little Theatre movement, which achieved remarkable results, stimulated interest in production and in the quality of plays and acting. Instead of presenting plays which had been commercial successes in the professional theatre, amateur companies selected pieces not commonly seen, and these works were frequently performed in the repertory theatres, where the company was amateur working under the direction of a professional producer.

The large cities such as Birmingham, Leeds, Bradford, Manchester, Liverpool, Bristol, and Hull, claimed a high percentage of these amateur companies working in repertory theatres. The Sheffield Repertory Theatre, for example, produced a play for one week every month of the year. The Leeds Art Theatre had a distinguished producer in Ellen

Amateur Theatre. Scene from Milton's *Samson Agonistes*, as performed by the enterprising amateur company of the Maddermarket Theatre, Norwich

Terry's daughter Edith Craig, and its productions attracted enthusiastic audiences. One of the most interesting experiments was carried out by Nugent Monck and the Norwich Players at the Maddermarket Theatre, Norwich. This society differed from most amateur dramatic companies in that it had a permanent home, a regular programme, and a professional producer. The company, however, was entirely amateur. The theatre, opened in 1921, was an exact model of an Elizabethan playhouse, and the whole of the Shakespearian repertory and the works of almost every Elizabethan dramatist of note were performed over a period of some 17 years.

Certain educational settlements, such as Citizen House, Bath, and Toynbee Hall, London, became the "Little Theatres" for their various towns or districts. In modern schools, no longer restricted to the annual, stilted "school play," acting came to be regarded as an important educational activity. Children are now more fully enabled to develop and discipline their inherent love of acting, and are increasingly anxious to continue their activity later by association with an amateur society. University amateur dramatic societies rank high, the best known being the Oxford University Dramatic Society (O.U.D.S.), founded in 1885, the Cambridge Amateur Dramatic Club, founded in 1854 and the

Marlowe Society, established in 1907 for the performance of Elizabethan plays.

There remains the largest group, those many societies, often connected with some pre-existing organization, a sports club, a commercial firm, even a church or chapel, whose members practise the dramatic art solely for their own entertainment and that of their friends, with benefit to charities as an additional but incidental justification. It was for such a society that R. C. Sherriff originally wrote *Journey's End* (*q.v.*); and for such societies J. B. Priestley wrote a special play, *Mystery at Greenfingers*. Many authorities have agreed that the amateur stage played no small part in keeping drama alive and vital during a difficult period when it had to face fierce competition from screen and radio.

The British Drama League's monthly magazine *Drama*, and the N.O.D.A. Bulletin, dealt exclusively with the amateur stage in Great Britain, and before 1939 several popular newspapers gave regular space to the activities of the amateur theatre.

Amati. Name of a famous Italian family of violin makers. They lived in Cremona, and the first of them was Andrea (d. c. 1611). His sons, Antonio (1550-1635) and Geronimo (1556-1630), continued the work and produced some magnificent instruments. Even more successful was Geronimo's son, Nicolo (1596-1684), whose model instrument was known as the grand Amati. His pupils included Stradivari (*q.v.*). The last of the family, Girolamo, son of Nicolo, died in 1740.

Amatitlán. Department and lake of Guatemala, Central America. The former is 463 sq. m. in area and is traversed by the rly. linking Puerto Barrios with San José and Champerico. The lake, 9 m. long by 3 m. broad, is surrounded by volcanic mts.; its outlet to the Pacific, the Rio Michatoyat, has a fine waterfall.

Amatitlán. Town of Guatemala, Central America. The capital of Amatitlán department, it stands on Lake Amatitlán, 15 m. by rly. S.W. of Guatemala city and has hot springs in the vicinity. It was founded by the Jesuits, and trades in cochineal, salt, raw silk, and fruit.

Amatol. High explosive used by the British, American, and German armies during the two Great Wars. Introduced by Britain in 1915 and copied by the Germans, it is a mixture of trinitrotoluene and ammonium nitrate, the proportion of the latter varying from 80 p.c. to 20 p.c., and enabling much larger quantities of explosive to be prepared from the nitrocompound available. While not so brilliant as trinitrotoluene or lyddite, it is more powerful, and is used as a filling in bombs, grenades, shells, and mines. The nitrate is dried and ground, and then incorporated with the trinitrotoluene by one of three methods.

If the percentage of trinitrotoluene exceeds 45 it is melted and the nitrate stirred in, forming a thin sludge, which can be poured into store and solidifies to a dense mass. In amatols which contain higher proportions of nitrate the ingredients are either milled together as in making gunpowder, or are mixed in a steam jacketed vessel, when the trinitrotoluene melts and

the mixture becomes plastic and can be rammed into projectiles by hand or fed in with a worm. The milled material, however, has to be consolidated by mechanical pressure if a high density is required. The pour method of filling is used exclusively for large stores such as bombs and mines. Owing to ammonium nitrate being hygroscopic the ingress of moisture must be prevented by a sealing. At high densities amatol is decidedly insensitive, so that in shell a gain is employed whereby the explosion of the detonator is reinforced by the interposition of a priming of tetryl and trinitrotoluene. See Ammonium: Explosives.

Amatongaland. Variant name of the district in Natal better known as Tongaland (*q.v.*).

Amazosa. A branch of the southern Bantu peoples. Traveling S. under a reputed 16th century chief, Xosa, they are the true Kaffirs, occupying the coast region S. of Natal, including Tembuland, Pondoland, and the Transkei. They are dark brown, muscular, averaging 5 ft. 10 ins. in height, and intelligent. Their tribal wealth is pastoral and agricultural.

Amaziah. Son and successor of Joash, and 8th king of Judah. He defeated the Edomites in the Valley of Salt, but worshipped the gods of the children of Seir and vainly challenged Jehoash, king of Israel, who utterly defeated him at Bethshemesh. He fled to Lachish, where he was assassinated (2 Kings 14; 2 Chr. 25). The name was borne by a priest at Bethel (Amos 7), a descendant of Simeon (1 Chr. 4), and a Levite (1 Chr. 6).

Amazon, THE. River of S. America. It is 4,000 m. long, and is the first in point of length of the world's rivers, but it comes second to the Mississippi and Missouri together. In aggregate length

Amazon. Characteristic scene on the river near to its junction with the Rio Negro, its principal affluent

of its navigable waterways and the size of its drainage area, it is the largest; the Amazon valley and watershed cover 2,700,000 sq. m., more than the combined areas of the Mississippi and Nile basins.

The upper tributaries of the Amazon rise partly in the snows of the Andes, in Peru, Bolivia, Ecuador, and Colombia, and flow, in their upper reaches, through cañons overlooked by the ancient strongholds of the Incas. Other tributaries come from the mountains of Venezuela and Guiana, and others have their source in the Amazon plain, in Brazil. Flowing between the great ranges of the Andes from S. to N. in Peru, and from N. to S. in Ecuador and Colombia, the upper tributaries traverse some of the most rugged country on the globe, breaking through the E. Cordillera in a series of remarkable *pongos*, or narrow rapids, whence they enter the dense forests of the Amazon plain, between walls of impenetrable foliage. Here the Bolivian and other affluents, uniting with them, form the broad and com-

paratively placid Amazon, and the river, paralleling the equator, receives the waters of the Brazilian tributaries and completes its course across S. America to the Atlantic near Pará.

The first European to navigate the length of the Amazon was Orellana, a lieutenant of Gonzalo Pizarro, who, embarking upon its headwaters (the river Napo), to the E. of Quito, floated downstream to the Atlantic in 1541. The name of the river has been ascribed to a mistake of Orellana's followers, who imagined that the long-haired Indians in their cotton shirts were Amazons or women warriors. Possibly the women fought too. In 1638 Teixeira ascended the river from its mouth to Quito, later returning downstream.

The sources of the Amazon are the headwaters of the Marañon, which rises above Lake Lauricocha. Other large Peruvian tributaries are the Huallaga and the Ucayali. Ocean steamers ascend the Amazon to the Peruvian town of Iquitos, some 2,500 m. from the Atlantic, and thus navigation is afforded into the heart of S. America from Europe. Small steamers ascend to the foot of the Andes. The Napo, the Putumayo, and other tributaries come from Ecuador and Colombia. The Negro also comes from the N., and on this tributary, near the confluence, stands Manãos. The Beni and Madre de Dios, from Bolivia and Peru, fall into the great Madeira, which, traversing the Brazilian plain from the S., empties into the Amazon below Manãos. Other Brazilian tributaries, coming also from the S., above Manãos, are the Purús and the Juruá, and below Manãos the Tapajos and the Xingú. In 1914 Theodore Roosevelt discovered a new tributary of the Madeira which has received his name. The Araguaya and Tocantins in reality

Amazon. Map showing the territory watered by the great river and its tributaries. Its drainage area exceeds those of the Mississippi and Nile combined

embody a separate system, with Pará near their mouth.

All the above great streams, varying from 500 m. to 2,000 m. long, with their smaller branches, afford access to the remotest parts of the Amazon valley. The conditions of navigability, however, vary greatly according to season, the flood periods adding many thousands of miles to the distances which can be traversed by steamer, canoe, or raft. In very dry seasons the fluvial port of Iquitos is reached with difficulty by ocean steamers. On the Madeira the head of steam navigation is at Porto Velho, above S. Antonio, and 1,000 m. from the main Amazon; and the elevation of the river here is 600 ft. above sea level.

Two flood periods occur annually in the Amazon, influenced respectively by the northern and southern-flowing tributaries. One is in Nov. and Dec., and the other, the principal, from March to June, causing a maximum rise of 45 ft. in the waters of the river. The Amazon, 2,000 m. from its mouth, on the Peruvian frontier at Tabatinga, is 9,000 ft. wide, with a normal depth at that point of 66 ft., and a current velocity of $1\frac{1}{2}$ m. per hour. Lower down, where the great Brazilian affluents enter, and nearer the mouth, it resembles a sea rather than a river. Tides are felt 500 m. above the mouth where the river is 200 ft. deep; near the main mouth it is 50 m. wide.

Many geographical and scientific expeditions have studied the Amazon and its hinterland in modern times. A British explorer, Col. P. W. Fawcett, was lost with his small party in the Xingú-Tapajos region in 1925. Three years later a relief expedition found evidence that they had met their deaths at the hands of natives.

Bibliography. *The Naturalist on the Amazon*, H. W. Bates, 1863; *The Sea and the Jungle*, H. M. Tomlinson, 1912; *Amazon and Andes*, K. G. Grubb, 1930; *Amazing Amazon*, R. and B. Brown, 1943.

Amazonas. Largest state of Brazil. Occupying an area of 731,363 sq. m. in the basin of the Amazon, it is densely wooded, especially S. of the river. The rich soil produces rubber, coffee, rice, and fruits, while cattle are extensively reared. Manaus is the capital and chief port. Pop. 463,900.

Amazonas. A department of Peru. It has an area of 13,943 sq. m., comprises the upper valley of the Marañon, the head stream of the Amazon, and produces

tobacco and sugar-cane. Pop. 65,137. Capital, Chachapoyas.

Amazonas. A territory of Venezuela. Forming a wedge between Brazil and Colombia, and giving rise to the Orinoco, it is mainly covered with forests, but some rubber is produced. Capital, Puerto Ayacucho. Pop. 3,728.

Amazon Cloth. All-wool plain dress fabric. It drapes elegantly, and is made usually of S. American merino wool, combed without oil and spun upon mule frames.

Amazons. In Greek legend, a race of women warriors, whose kingdom lay on the S. shores of the Euxine or Black Sea. Headed by their queens, they fought against Greece and other states and extended their empire as far as the Caspian Sea. No men were allowed within their borders, and when they wished to have children they visited other tribes. Only the girls were reared. Amazons are represented in Greek art as beautiful women, armed for battle, mounted on fiery horses and trampling on their fallen foes.

Legends without number cluster round the names of the Amazon queens. Thalestris disdained any lesser mate than Alexander the Great; Penthesileia led her hosts against the Greeks in the Trojan War and, dying at the hand of Achilles, drew tears of pity from her slayer. Antiope, won in battle by Theseus, later fought at his side when he undertook a second expedition against the Amazons to help Hercules (Hercules) to obtain the golden girdle of Queen Hippolytē, her sister. Whether the Amazons really existed remains doubtful. Diodorus Siculus speaks of a race of African Amazons, prototypes perhaps of the women warriors of Dahomey. *Consult* Religious Cults Associated with the Amazons, Florence M. Bennett, 1912.

Amazon Stone. Variety of the potash-felspar microcline. Usually of a green colour and occurring as a constituent of coarsely crystalline granites and pegmatites,

it is used in ornaments. It is found chiefly in the Urals, Colorado, and Madagascar.

Amba Alagi. Mt., more than 10,000 ft. alt., in Abyssinia, near Magdala, W. of the Eritrean border. It was the scene of the surrender of the duke of Aosta (*q.v.*) and his Italian army in May, 1941. The Italians had been skilfully hemmed into the mountain fastness of Amba Alagi by the Imperial forces, who carried out an ingenious plan with great courage and determination under Gens. Cunningham and Platt. As a result of these operations, the enemy was surrounded by May 15, and the strongly fortified caves of Amba Alagi, at a height of some 9,000 ft., were rendered valueless. On May 16 Aosta sent emissaries to Gen. Cunningham to ask for terms. Unconditional surrender of his exhausted and half-starved men followed; they were granted the honours of war. Aosta, with five generals and other staff officers, was among those who surrendered. Prisoners numbered some 18,000, of whom about 7,000 were Italians. After the fall of Amba Alagi the only Italian stronghold to continue resistance was Gondar (*q.v.*), which surrendered unconditionally after a six months' siege. *See* East Africa Campaign.

Ambala OR UMBALLA. District and town of India, in the E. Punjab prov. The area of the district is 1,851 sq. m. and the population about 800,000. The town of Ambala, capital of the prov. since its formation in 1947, is at the junction of the North-Western rly. and the rly. from Delhi to Simla. An important garrison town during the time when it was under British rule, it is the centre of a large trade in grain and cotton goods. Pop. 76,326.

Ambarawa. Town of Java, Indonesia. It is situated 260 m. E.S.E. of Batavia, and has a station on the coast-to-coast rly. During their occupation of Java the Japanese set up here an internment camp for Dutch civilians which in Nov., 1945, was savagely attacked by Indonesian terrorists, a number of the inmates being killed. A small force of Gurkhas, part of the British force landed in Sept. (*see* Indonesia), reached the camp Nov. 22, severe fighting followed, and it was Dec. 14 before the internees were evacuated to Semarang.

Ambassador (late Lat. *ambascia*, mission, agency). Name given to the representative of one

Amazon
Vatican, Rome

country in the capital of another. In practice the word is reserved for the representatives sent by one Great Power to another, those sent to less important countries being called ministers, envoys, or *chargés d'affaires*. Great Britain, for instance, is represented by an ambassador in Washington and Paris, but only by an envoy or minister in Stockholm and Berne.

Ambassadors are of two kinds, ordinary and extraordinary. The ordinary are entrusted with the conduct of diplomatic business between the two countries and hold office for a number of years; extraordinary have a particular duty, e.g. that of representing their country at a peace conference. Ambassadors are regarded as direct representatives of their sovereigns, and as such have many social and other privileges. In order of precedence in Great Britain they come immediately after princes of the blood and before the archbishop of Canterbury. They have direct access to the sovereign in whose land they reside, although in Great Britain and other constitutional countries such interviews are always held in the presence of a responsible minister. Their residences, which are regarded as standing on the soil of their own country, are free from rates and taxes, and ambassadors and their attendants are not amenable to the law of the land in which they live.

The business of an ambassador is to keep his own government acquainted with the ideas and opinions of the country to which he is accredited. His status is mainly regulated by the treaties of Vienna (1815) and Aix-la-Chapelle (1818). Before the Second Great War, Great Britain sent ambassadors to some 28 countries. The U.S.A. began to send out ambassadors in 1893; before that date it sent simply ministers. In 1945 there were 32 U.S. ambassadors to various countries. The U.S.A. had also introduced women ambassadors. The withdrawal of an ambassador is usually a preliminary step to a declaration of war. See Diplomacy.

Ambassador. British monoplane, formerly the A.S.57. It was designed and first built in 1945 at the Airspeed factory, Christchurch, for use on European main line services, with accommodation for 28 or 36 passengers, and two Bristol Centaurus engines, each of 2,500 h.p., giving a cruising speed of between 200 and 285 m.p.h.

Ambassadors Theatre. London playhouse, in West Street, Shaftesbury Avenue, W.C.2. It was opened June 5, 1913. Here during 1944-48 successive revues, *Sweeter and Lower*, *Sweetest and Lowest*, ran respectively 870 and 793 perfs.

Ambato. Town of Ecuador. Capital of Tungurahua province, it stands on the N.E. slope of Chimborazo, 8,600 ft. above sea level and 80 m. S. of Quito, on the rly. to Guayaquil. An eruption of Cotopaxi destroyed it in 1698, and a series of earthquakes in 1949 caused very wide damage with heavy loss of life. Normally it makes boots, shoes, and cordage, and trades in grain, sugar, fruit, and cochineal. Pop. 25,200.

Ambela. Mt. pass of Pakistan. Situated in the N.W. Frontier province, about 30 m. N.E. of Peshawar, it was the scene of British military operations in 1863 against the tribes of Swat and Buner.

Amber (Arabic *anbar*, *ambergris*). Fossil resin derived from extinct coniferous trees and occurring almost exclusively in clays of the Oligocene system. It is found principally on the southern shores of the Baltic and in pits or mines in Samland, former E. Prussia. It occurs also in Sicily, Poland, Saxony, Siberia, Greenland, China, and Siam, and pieces are found on the E. coast of England. Baltic amber varies in colour from pale yellow to reddish brown and is either transparent or exhibits different degrees of turbidity. The trade classifications—clear, cloudy, frothy, bone, etc.—refer to these appearances. Sicilian amber is red with green or blue fluorescence.

Amber takes a high polish and is used for the manufacture of beads, the mouthpieces of pipes, cigar and cigarette holders, and the handles of umbrellas. The small pieces are made into a varnish. The powder obtained in working amber can be distilled, when it yields oil of amber, employed as an ingredient in a liniment and in the manufacture of a variety of artificial musk. Small pieces of amber, by heat and strong pressure, are compressed into a solid substance known as ambroid, which is employed for ornamental purposes. When amber is rubbed it becomes negatively electrified and emits a pleasant odour, these features serving to distinguish amber from common copal, which is similar in appearance. Pieces of amber often entomb flies and fragments of organic matter. The expression "like flies in amber" refers to this. Besides resins, there

is present in amber from 3 p.c. to 8 p.c. of succinic acid. Green and blue ambers exist, but are rare.

Amberg. Town of Bavaria. On the river Vils, 41 m. by rly. E. of Nuremberg, it has some old walls and moats, and a town hall dating from 1490. It manufactures beer, cotton, ironmongery, and earthenware. Pop. 26,330.

Ambergris (Fr. *ambre gris*, grey amber). Fatty substance, grey in colour, formed in the intestines of the spermaceti whale. It contains veins resembling marble, and is usually found in warm climates, washed up on the shores or floating on the water in masses weighing up to 270 lb. It dissolves in ether and volatile oils and is used very largely in perfumery as a base for various perfumes.

Amberite. Older form of smokeless powder. Manufactured for sporting guns, it is of the type known as a 42-gr. powder, since this weight occupies the same space as the standard charge of 82 gr. of black gunpowder. Hard shooting with safety, great penetration, and only a moderate strain on the gun are claimed for it. Its analysis shows the following composition: nitrocellulose, 71 p.c.; barium nitrate, 18.61; potassium nitrate, 1.2; vaseline, 5.8; wood meal, 1.4. See Explosives.

Amberley. Village of Sussex, England, on the Arun, 5 m. N. by road from Arundel, with a railway station. It has a ruined castle of the bishops of Chichester, dating from 1377. After rain the Wild Brooks provide anstrond. Another Amberley is near Stroud, Gloucestershire.

Ambidexterity (Latin *ambo*, both; *dexter*, right-handed). Ability to use the right and left hands with equal facility, often observed in artists and surgeons. In law the word was early used for the receiving of bribes from both parties in a suit by a juror. In the 17th century the form *ambodexterity* was more common.

Ambiguity (Latin *ambiguus*, doubtful). Word signifying double meaning, a frequent subject of debate in law. Two kinds of ambiguity, latent and patent, may occur in documents. A latent ambiguity, which arises from the use of words which have two meanings, may always be cleared up by extensive evidence. For instance a man might leave a sum of money to "my grandson Frederick." If he had two grandsons of that name evidence would have to be put forward, showing which of the two was meant. A patent ambiguity, however, cannot

be explained by verbal evidence. Where words in a document are ambiguous, they ought to be interpreted against the person who drew the document.

Ambleside. Urban district and market town of Westmorland, England. It is in the valley of the

on the Loire, 15 m. by rly. E. of Tours. It has manufactures of cotton, steel, and leather, and a trade in wine. The castle was from 1431 a royal residence, and Charles VIII was born and died here. Its chief features are the Gothic chapel of S. Hubert, where Leon-

out legal and eccles. reforms, but his foreign policy, directed towards strengthening French influence in Italy and winning the papacy for himself, was unsuccessful. Rouen benefited by his generosity, and his relief work during the plague in 1504 endeared him to the citizens. He died at Lyons, May 25, 1510. His tomb in Rouen Cathedral is fine Renaissance work.

Amboyna OR AMBOINA (Dutch, *Ambon*). Island of the Molucca group, Indonesia, lying about 10 m. off the S.W. extremity of the island of Ceram. Its area is about 360 sq. m. and its 1941 population was about 278,000. It consists practically of two peninsulas, Leitimor and Hitoe, with the Bay of Amboyna between them. Although mountainous, it is fertile, and produces cloves (its speciality), sago, sugar, rice, coffee, and pepper. Amboyna wood, which is found on Amboyna and on Ceram, is used in veneer form in fine cabinet work and small fancy articles such as tea caddies and cigarette boxes. Amboyna, the capital, has a good roadstead, and an inner harbour which is almost completely landlocked.

Shortly before the outbreak of the Second Great War, Amboyna

Ambleside. General view of this beautifully situated Westmorland town, near Lake Windermere. In the background is Wansfell

Rothay, at the foot of Wansfell Pike, 1 m. from the head of Lake Windermere. The church of S. Mary, designed by Sir G. G. Scott, has a memorial window to Wordsworth. On the last Saturday in July a rush-bearing festival is held here, as well as at Grasmere. Ambleside is an excellent centre for excursions. Market day, Wed. Pop. 2,343.

Amblystoma (Gr. *amblys*, blunt; *stoma*, mouth). Genus of salamander, found in the U.S.A. and Mexico. It is the sexually mature stage of the axolotl (*q.v.*).

Ambo (Gr. *ambōn*, from *anabainein*, to ascend). Rostrum or reading desk with steps whence the Gospel and Epistle were read, notices given out, and sermons occasionally preached in early Christian churches. It was largely

ardo da Vinci is said to have been buried, the three massive round towers, and the oubliettes or underground cells, in which political prisoners were confined. It was used in the 19th century as a state prison, and in 1875 the comte de Paris, to whose family it belonged, began to restore it, but the work was still incomplete when the ruins were seriously damaged in the Second Great War. Other notable buildings are the churches of S. Denis and S. Florentin, and one of the town's old gates. Amboise is memorable

for the Huguenot conspiracy of 1560 against the Guise party and for the edict of 1563, which conceded valuable privileges to the Protestants.

Amboise, GEORGES D' (1460-1510). A French statesman and cardinal. Born at Chaumont-sur-Loire, of a noble family, he served as almoner to Louis XI before being appointed archbishop of Narbonne in 1492 and of Rouen in 1493. He was made chief minister by Louis XII in 1498 and created a cardinal. In his internal administration he carried

Amboise. Ancient French town on the Loire once a royal residence

became, after Surabaya (*q.v.*), the largest naval and air base in Indonesia.

The island was discovered by the Portuguese early in the 16th century, and was taken by the Dutch about 1609. The Dutch held it until 1796, and regained it from Britain at the peace of 1802, but it was again in British possession from 1810-14. The population consists of Malays with a few European and Chinese settlers. The Dutch residency of Amboyna included Buru, Ceram,

Ambo, or reading desk

superseced by the pulpit. Examples are in the churches of S. Clement at Rome and S. Thomas, Hanwell, Middlesex. The plural is amboines.

Amboise. A town of central France, department of Indre-et-Loire. The ancient Ambatia, it is

and other islands having a total area of nearly 20,000 sq. m.

Ambosyna was known to British people from the massacre of 1623. Its trade was then confined by treaty to the two East India Companies, English and Dutch, and the Dutch tried to expel their rivals. Some English residents being charged with conspiring to seize the castle at Ambosyna, their settlement at Cambello was destroyed, and many of them were tortured and put to death. When England and Holland made peace in 1654, the Dutch paid £300,000 as compensation. Dryden made the incident the theme of a tragedy.

On Jan. 30, 1942, in the course of their attack on the Netherlands E. Indies and their encirclement of Java, Japanese aircraft made a heavy assault on Ambosyna; and on the same night troops were landed from a powerful Japanese fleet. Bitter fighting developed, but by Feb. 7 the island was in Japanese hands, and remained so until the official surrender of Indonesia to Australian forces, Sept. 8, 1945.

Ambrine. Mixture of melted paraffin and amber resin, a remedy for burns and scalds. It was discovered in 1904 by the French doctor, Barthe de Sandfort, who had used it first on himself, in seeking to reproduce the properties of the Dax mud baths, to relieve rheumatism. Its efficacy in treating burns was first proved on a Chinese during the Boxer rebellion; but this use was not general until the First Great War.

Ambriz. A town of Angola, Portuguese W. Africa. It is at the mouth of the Loje, 70 m. N. of Loanda, and was regarded as the most N. point of the Portuguese possessions in W. Africa before the Anglo-Portuguese treaty of 1884. Coffee, rubber, and copal are exported.

Ambros, AUGUST WILHELM (1816-76). Austrian composer and writer on music. Born at Mauth, Bohemia, Nov. 17, 1816, he spent many years in the civil service, devoting his leisure to the study of music. His *History of Music*, 5 vols., 1862-82, is a work of high authority. He died at Vienna, June 28, 1876.

Ambrose, SAINT (c. 340-97). Bishop of Milan. Son of a Christian prefect of Gaul, his place of birth is disputed, the cities of Trèves, Arles, and Lyons claiming the distinction. He was trained at Rome for the law and was sent to Milan as consular governor of Liguria and Aemilia.

In 374, on the death of the Arian bishop of Milan, Ambrose, then a layman, was chosen to succeed him. The first ten years of his episcopate were largely occupied with the Arian controversy. Presiding over the council of Aquileja (381), Ambrose secured the deposition of the Arian bishops of Illyricum and refused the demand of the empress Justina (mother of Valentinian II) for a church in Milan for the Arians. The long struggle with the empress over the question of recognizing Arian worship ended in favour of the bishop. The popular story of S. Ambrose excluding the emperor Theodosius from the church, after the massacre of the Thessalonians, is an exaggerated version of what took place. Some 7,000 citizens had been massacred, under the

authority of Theodosius, after an outbreak of sedition, and Ambrose to avoid meeting the emperor retired from Milan, and in a letter urged Theodosius to do penance. Theodosius complied, "stripping himself of every emblem of royalty," and the friendship between the two lasted till the death of the emperor in 395. Ambrose died on Good Friday, April 4, 397, and his day is observed on April 4.

Ambrose wrote much against the Arians and was one of the earliest Latin hymn writers. *Consult* Life, J. V. Albert, duc de Broglie, Eng. trans. M. Maitland, 1899.

Ambrosia (Gr. *ambrotos*, immortal). In Greek and Roman mythology, the food of the gods. It conferred immortality on those who ate it, and possessed the power of healing wounds. Its taste

S. Ambrose refusing Theodosius entry to church after the massacre of the Thessalonians. A great painter's rendering of the legendary story
Painting by Rubens, Imperial Art-History Museum, Vienna

was nine times as sweet as honey, and its fragrance delicious. Juno and Aphrodite anointed their flowing locks with ambrosia, and in the Aeneid Virgil tells how Venus used it as a salve to cure the wounds of her son.

Ambrosian Chant. Term applied to the traditional ritual music of the Christian church, held to have been systematised by S. Ambrose, who probably composed the melodies for his own hymns. Now used only in the diocese of Milan, it was in the late 6th century merged in the Gregorian chant introduced by Pope Gregory the Great.

Ambrosian Library. Famous library of Milan. Founded by Cardinal F. Borromeo and named after S. Ambrose, it is housed in a building erected for it 1603-09. It contained 230,000 vols. and 8,400 MSS., including fragments of a 4th century MS. of Homer, a Virgil annotated by Petrarch, an early 14th century MS. of Dante's Divine Comedy, and drawings and MSS. of Leonardo da Vinci. In the Second Great War the most valuable material was removed to safety, but there was some loss by fire of the remainder.

Ambrosius, AURELIANUS. A leader of the Britons during the 5th century. Of Roman descent, he drove the Saxons back to the Isle of Thanet. His Celtic name was Emrys. Gildas and Geoffrey of Monmouth refer to Ambrosius as the son of Constantine, emperor of Britain, Gaul, and Spain, and state that he was poisoned by a Saxon at Winchester.

Ambry, AUMBRY, ALMERY, OR ARMALIORUM (Lat. *armarium*, cupboard, or safe). In medieval churches, a cupboard or niche in a wall with shelves for the sacred vessels, the Host, holy oil, etc. Large churches might possess

Ambry. Two examples of this form of cupboard or niche in a church wall

several ambries. In monasteries the word was applied to linen presses or pantries, and is still used in this sense in Scotland.

AMBULANCE: FOR SICK AND INJURED

Henry T. Ferrier, F.R.S.A., Officer of the Order of St. John

This article by the joint secretary of the Ambulance Committee, Order of St. John and British Red Cross Society, and former Director of Transport of Wounded, reviews the development of the ambulance service, military, civil, and civil defence. See also under Nursing; Red Cross; St. John Ambulance Assoc., etc.

The word ambulance, derived through the French from the Latin *ambulare*, to move about, was originally used to designate a movable hospital. Since the Crimean war, however, it has become a generic term in popular use for vehicles or conveyances of the sick or wounded. The correct military definition of a field ambulance is now a mobile field medical unit.

MILITARY. The French army surgeon, Larrey, while serving on the Rhine in 1792, proposed the formation of a field hospital. Larrey conceived the idea of a system of light but strong carriages suspended on springs, in which the wounded could be rapidly collected from the battlefield. His "flying ambulance" was subsequently adopted throughout the French army.

In the meantime no efficient ambulance system was adopted by Great Britain. Throughout the Peninsular war the British wounded were removed from the field of battle on stretchers carried by bandmen, who took them as far as the first line of surgical assistance, whence they were conveyed to hospitals in the carts of the commissariat, or in bullock waggons. At the outset of the Crimean war, ambulance waggons did not exist in the British army. The wounded were moved in carts drawn by horses, or were seated in cacolets suspended on either side of a mule, and the system broke down to a lamentable extent. An ambulance waggon similar in construction to that used by the French was adopted after Sidney Herbert's commission, 1857-58, and a few British

horse-drawn ambulances were used in the Franco-Prussian war, 1870. From that time to the outbreak of the First Great War no outstanding improvements took place in this form of medical transport.

In Sept., 1914, a few members of the Royal Automobile Club offered to place themselves and their cars at the disposal of the Red Cross. The next day several of these cars went over to France. By the end of Jan., 1915, 830 motor ambulances had been landed in France by the British Red Cross. From ten to fifteen tons of spare parts were shipped weekly. In the interests of standardisation the number of varieties of cars was reduced to sixteen. Altogether more than 2,000 cars converted for ambulance work were dispatched, covering every theatre of war. Later the Red Cross units were partly or wholly absorbed into the army medical units under the R.A.M.C. and R.A.S.C. Wide use was also made of motor launches in Mesopotamia, Egypt, the Dardanelles, Malta, German East Africa, and elsewhere.

Ambulance Trains

The earliest railway ambulance trains were seen during the Crimean war in 1855, the Italian campaign in 1859, and the Slesvig-Holstein war of 1864. But these were primitive adaptations. In 1900 the first train built expressly for the British Red Cross Society was sent to South Africa for use in the Boer war. In 1915 a more completely equipped train constructed by the Birmingham Rly. Co. was shipped to France. In the main the arrangements for the wards followed the design of the train of 1900. The beds were supported on brackets in tiers, and were capable of being removed and used as stretchers, the patient thus being placed in his assigned berth without change. The wards were constructed for 36 patients. A main kitchen, surgery, subsidiary kitchen, mess, and sleeping accommodation for the staff were also provided. The ambulance trains used in the Second Great War did not differ materially. Equipment was more modern and elaborate.

The most notable developments between 1939 and 1945 were the use of aircraft in the rapid transport of wounded from the battlefield to home-based hospitals, and the insistence by the War Office on a single standard ambulance in every theatre of war. Built to the design of War Office experts, it was constructed to be

mounted on a 24 h.p. Austin chassis, with large track-type tires, incorporating a stretcher-loading device of unique design. The carrying capacity was 4 stretcher cases or 10 sitting cases or 2 stretcher and 5 sitting cases. Constructed to operate under desert conditions, through ploughed fields, or water, and proofed against chemical warfare, it was easily handled by the women of the services. Over 13,000 were constructed before the "Austin K2" ceased production in Aug., 1945.

CIVIL. Before 1914 the sight of an ambulance on the roads of England was a rare event. Here and there in the larger towns a horse-drawn ambulance might be seen. It was a dingy vehicle, and its duty was generally confined to the carrying of infectious cases to the isolation hospital. In only a few of the great cities had municipal authorities established a motor ambulance service. The London County Council was content with the service of hand-propelled wheeled litters established by the police. There was much more home treatment of the sick and much less institutional treatment, and road accidents too, which now figure so largely in the long day's work of the ambulance service, were on a much lower scale.

In 1909 Sir W. J. Collins introduced and piloted through Parliament a bill enabling the L.C.C. to establish a motor ambulance service, but it was not until 1915 that this service was inaugurated to deal with street accidents.

National Ambulance Service

The end of the First Great War afforded an opportunity for meeting a civilian want that had become urgent. Many of the ambulances of the joint war organization of the Order of St. John and the British Red Cross Society were available. The two organizations therefore arranged to continue their association in promoting the health of the community. One of their first steps, for which Sir Ernest H. Clarke was responsible, was the organization of a national ambulance service for England, Wales, and Ireland. A committee of experts, the Home Service Ambulance Committee, was founded in 1919. The number of ambulances operating in 1943, twenty-four years after the inception of the service, was nearly 600, administered and controlled by units of the "Order" and the "Society."

The modern trend aims at the rapid transport of a casualty,

whether civil or military, to the properly equipped first-aid post, casualty clearing station, or hospital with as little interference as possible. Though this may be sound practice in towns, in districts remote from hospitals or skilled medical aid every provision must be made by the ambulance team to avoid further risk during the journey. While an invalid is being moved from home to hospital, he must be subject to ordinary sick-room procedure. So in every properly organized ambulance service the driver of the vehicle must be trained in first aid, and the attendant, male or female, must be skilled in home nursing and first aid. The special case will demand the extra services of the trained nurse.

CIVIL DEFENCE SERVICES. Before, and immediately after, the outbreak of the Second Great War, every conceivable form of ambulance came into being in great numbers to supplement the existing ambulance and A.R.P. services. Under government instructions, local authorities pressed into service both commercial and private vehicles, the former being supplied with the simplest forms of stretcher gear, the bodies of private cars being sawn in two and light box bodies fitted. Thousands of cars were so adapted throughout the country to meet the anticipated need. Later in the war, large 32-seater coaches were converted to take 16 stretchers, and were used principally to remove patients from the congested central hospitals to base hospitals outside the London area.

DESIGN. Modern ambulances for civil purposes are mostly restricted to the single-stretcher type plus sitting accommodation for at least three persons, provision being made for an occasional second stretcher by inversion of the long seat, withdrawal of concealed runners, or operation of patent gear. Normally the four-stretcher type is favoured for inter-hospital transport or the removal of convalescent patients. Designs vary considerably; but the less complicated the lay-out of an ambulance, the greater the freedom from rattles, squeaks, and other extraneous noises. Body design falls into four distinct types: accident, general service, long distance, and the infectious.

An interesting innovation reported by the Victoria civil ambulance service, Melbourne, Australia, was the installation of a 200-watt radio telephone trans-

mitter at its H.Q. The 17 ambulances in the accident service are equipped with crystal-locked receiving sets, thus providing instantaneous communication.

The Public Health Act, 1936, and the Public Health (London) Act, 1936, gave local authorities the power to run ambulance services. Some are doing so, while others have confined themselves to accident cases, leaving the rest to some other ambulance organization or even to private enterprise. Like the hospital services, the ambulance services of Great Britain have developed along individualist lines. Voluntary effort has been evident all through their history. It is realized by all concerned that this specialised ancillary medical service can be made more effective with nation-wide coordination. To this end the Home Service Ambulance Committee of Joint Order of St. John and the British Red Cross Society, by far the largest single ambulance organization in the country, cooperates with the Ministry of Health. County and regional surveys were carried out in 1944. History repeated itself at the end of the Second Great War: the Home Service Ambulance Committee became the medium whereby hundreds of ambulances were to be allocated as needed, and proceeded to a completion of a scheme for the final coordination of all the ambulance services of the country.

Ambulatory (Latin *ambulatio*, promenade). In monastic or ecclesiastical architecture, any covered gallery or passage such as cloisters, or a place for processions leading behind the high altar and round a church. There are double ambulatories in the cathedral of Notre Dame at Paris and in that of Chartres. See Cathedral.

Ambush (Lat. *in*, in; late Lat. *boscus*, wood or bush). A term applied to the concealing of soldiers or others with a view to a sudden attack, and also to the place of concealment and to the men concealed. Ambuscade is an older and less usual form. As ambuscading can only be employed where small bodies of men are concerned, it has almost disappeared from modern formal warfare, though it is still effective in guerilla and "underground" warfare. The word originally meant hiding in a bush or thicket.

Ameer or **EMIR** (Arab, *amara*, to command). Title used in the Mahomedan East, meaning commander. Originally a military title,

it came to be applied generally to rulers and high officials and as a title of dignity to the descendants of Mahomet. The rulers of Afghanistan and Transjordan are ameers. As leader of Islam the sultan of Turkey was called Amir ul Muminim or commander of the faithful. The word admiral comes from *amir al (bahr)*, commander of the (sea).

Ameer-Ali, SYED (1849-1928). Indian lawyer. Born April 6, 1849, he became an English barrister in 1873, and was appointed lecturer on law at the Presidency College, Calcutta. He was afterwards chief magistrate of Calcutta (1878-81) and member of the legislative council of Bengal (1878-83). In 1883 he became a member of the legislative council of India, and in 1890 a judge of the High Court of Calcutta. In 1909 he was appointed a member of the Judicial Committee of the Privy Council, by virtue of an Act empowering the sovereign to appoint to regular and paid membership of that body someone who had held high judicial office in India. A great authority on Mahomedan law, he wrote *Personal Law of the Mahomedans*; other works of his pen were *The Ethics of Islam*, *The Spirit of Islam*, and *A Short History of the Saracens*. He died Aug. 3, 1928.

Amelia. City and episcopal see of central Italy, Terni province. It is 21 m. S.W. of Spoleto, 1,300 ft. above sea level. One of the oldest cities of Umbria, it was known to the ancients as Ameria. There are fine remains of the original city walls. The bishopric dates back to the 4th century.

Amelia. Fourth and last of Henry Fielding's novels, published in 1751. The story is one that broke with an early convention of the novelist, in that it begins with the marriage of its hero and heroine Lieutenant Booth and Amelia Harris, who are supposed more or less closely to represent the author and his first wife. With less broad humour and variety than is found in Fielding's earlier novels, *Amelia* is a faithful presentation of certain sides of social and domestic life of the first half of the 18th century. It was highly regarded by Dr. Johnson, and Thackeray thought it the author's finest work.

Amélie-les-Bains. Watering-place of France, named after Amélie, wife of Louis Philippe. It is in the dept. of Pyrénées-Orientales, at the union of the Tech and the Mondony. Standing high, it is visited for its sulphur waters, which are used for both bathing and

Amen Court, London, E.C
Judges' Ltd

drinking. They were known to the Romans, many remains of whose baths have been found.

Amen (Heb., truly, so let it be). In public worship, word used in confirmation of a statement, as at the end of the Creed; or added in a petitionary sense to a prayer, as customary from apostolic times. In the English Prayer Book, when the word is printed in Roman characters it is pronounced by minister and people in unison; when in italic by the people only. In the Authorised Version of the Bible at the beginning of a sentence it is used for emphasis (e.g. Jer. 28, 6; Mark 10, 15) and is translated "verily." The Hebrew of Is. 65, 16, has "the God of Amen," which is translated in A.V. "the God of truth"; in Rev. 3, 14, Christ is called "the Amen, the faithful and true witness." As in liturgical use the word is so frequently sung or intoned, musical settings of the word are innumerable. Examples are Naumann's threefold Dresden Amen (named

after the Chapel Royal at Dresden, and introduced into Wagner's *Parsifal*) and Stainer's *Sevenfold Amen*; and Handel's great *Amen Chorus* is a sublime finale to his oratorio *Messiah*.

Amen Court. Enclosed court in the City of London, containing the residences of the canons of S. Paul's Cathedral. It opens from Ave Maria Lane and Amen Corner, and before the war time devastation of the district its quietness was in marked contrast to the bustle without. The name is a reminder of the days when religious processions marched round S. Paul's. The singing or chanting was so timed that the Amen was sung when the priests and singers reached Amen Corner. The court was damaged by the air raids of 1940-41, though not irreparably, nor, indeed, in any measure relative to the great destruction in its immediate neighbourhood.

Amendment (Latin *emendare*, to correct). Act of amending or improving anything. The term is applied particularly to any alteration suggested in a bill before Parliament or a resolution before a public meeting. British practice is for the amendment to be voted upon before the main resolution; if carried, the resolution, as altered by the amendment, is put to the meeting for acceptance. In Parliament an amendment is sometimes used to change entirely a clause in a bill and so destroy the bill. This takes the form of moving that after the first word, usually "that," the whole clause is deleted and something different substituted.

As a legal term, amendment means the correction of an error in a pleading or other judicial proceeding. Modern legislation has made this much easier, and it is now mainly a question of costs. In the U.S.A. alterations in the constitution are called amendments. To make these, legislation under special conditions laid down in the constitution is needed.

Amenemhat. Name of four Egyptian kings of the XIIth dynasty. The greatest, Amenemhat III, built an embankment 20 m. long for reclaiming 40 sq. m. from Lake Moeris in the Fayum. His pyramid there contains a sepulchral chamber hallowed out of a single 110-ton quartzite block. Near this was a funerary temple, celebrated in antiquity as the Labyrinth. See Pyramids.

Amenhotep. Name of four Egyptian kings of the XVIIIth dynasty. Called by the Greeks Amenophis, the most famous, Amenhotep III, c. 1400 B.C.,

Amenemhat III, a contemporary
portrait carved in obsidian
Egypt Exploration Society

Amenhotep III. Portrait head from a colossal statue of the Egyptian king
British Museum

exacted tribute from Nubia to the Euphrates, and wedded a half-Syrian queen Tui. His diplomatic correspondence has been recovered. He sculptured a rock-cut tomb and the colossi of Memnon at Thebes. His son, Amenhotep IV, renamed Akhnaton (*q.v.*), who succeeded him, sought to make the Egyptians worship one god only, the sun-god.

Amen-Ra OR AMMON. An Egyptian deity. Amen, or the hidden one, was a local Theban god whose worship developed after the Hyksos expulsion. In combination with the sun-god, Ra of Heliopolis, he became the national god of the new empire (XVIIIth-XXVth dynasties), the reigning queen being his high priestess. He is usually depicted in a cap with two high plumes.

Amentaceae (Latin *amentum*, thong, strap). Family of trees and shrubs which have alternate leaves and unisexual flowers without petals. The males are often in pendulous spikes or catkins known as amenta. The order consists of ten genera, which include about

Amentaceae. Aspen leaves and catkin

400 species, among them some of the best-known timber trees, such as oak, beech, hornbeam, alder, birch, and chestnut. They are chiefly characteristic of the N. temperate regions, but a few are found in the S. hemisphere.

Amenti OR AMENTER. The underworld of the ancient Egyptians. This hidden land was

inhabited by human souls journeying to the peaceful fields of the blessed. In one account it was traversed nightly by the sun-god Ra; in another the dead soul was weighed in the balance in the presence of its lord Osiris.

Amercement OR AMERCIAMENT (late Latin *amerciare*, to fine). Legal term used in feudal times, but now obsolete. It was a fine imposed on an offender in lieu of the forfeiture of his goods. The

goods were declared at the mercy of the king, lord, or other legal authority. It was sometimes affeered or assessed by men of the neighbourhood, sometimes by custom. In the 12th century amercements were frequent and excessive, and in 1215, by Magna Carta, the amount of the fine was regulated, but had to be commensurate with the offence. *Consult* History of English Law, Pollock and Maitland, Vol. II, 1898.

AMERICA: AN INTRODUCTORY SURVEY

Herbert W. Horwill, Writer on American Affairs

This article deals broadly with the American continent as a whole. More detailed information is given in articles on the main divisions (North America; South America; West Indies, etc.), and the different countries (Argentina; Canada; United States, etc.)

America has been unfortunate in its name. The term is ambiguous and confusing. Though properly denoting the whole continent, it is more commonly used as a synonym for the United States, which constitute not much more than one-fourth of its area. Moreover, the name commemorates not the actual discoverer but a later and less important explorer, and even so recalls his Christian name instead of his surname.

There are traditions of visits to America by Norsemen in the 10th century, but it was undoubtedly Christopher Columbus who made the existence of the New World known to the Old. On Oct. 12, 1492, while seeking a new sea route to China and India, he sighted the Bahamas. On his third westward voyage, begun in 1498, he reached the mainland of South America. In 1497 John Cabot landed in what is now Canada. The claim of Amerigo Vespucci, a Florentine, to have been the first to set foot on the mainland of the continent is not adequately substantiated. Other notable dates are 1500, when Pinzon and Cabral severally reached Brazil; 1512, when de Leon was the first to explore the Florida coast; 1513, when Balboa (not Cortes, as in Keats's poem) caught a glimpse of the Pacific Ocean from "a peak in Darien"; 1520, when Magellan passed through the strait that bears his name; and 1535, when Cartier sailed up the St. Lawrence.

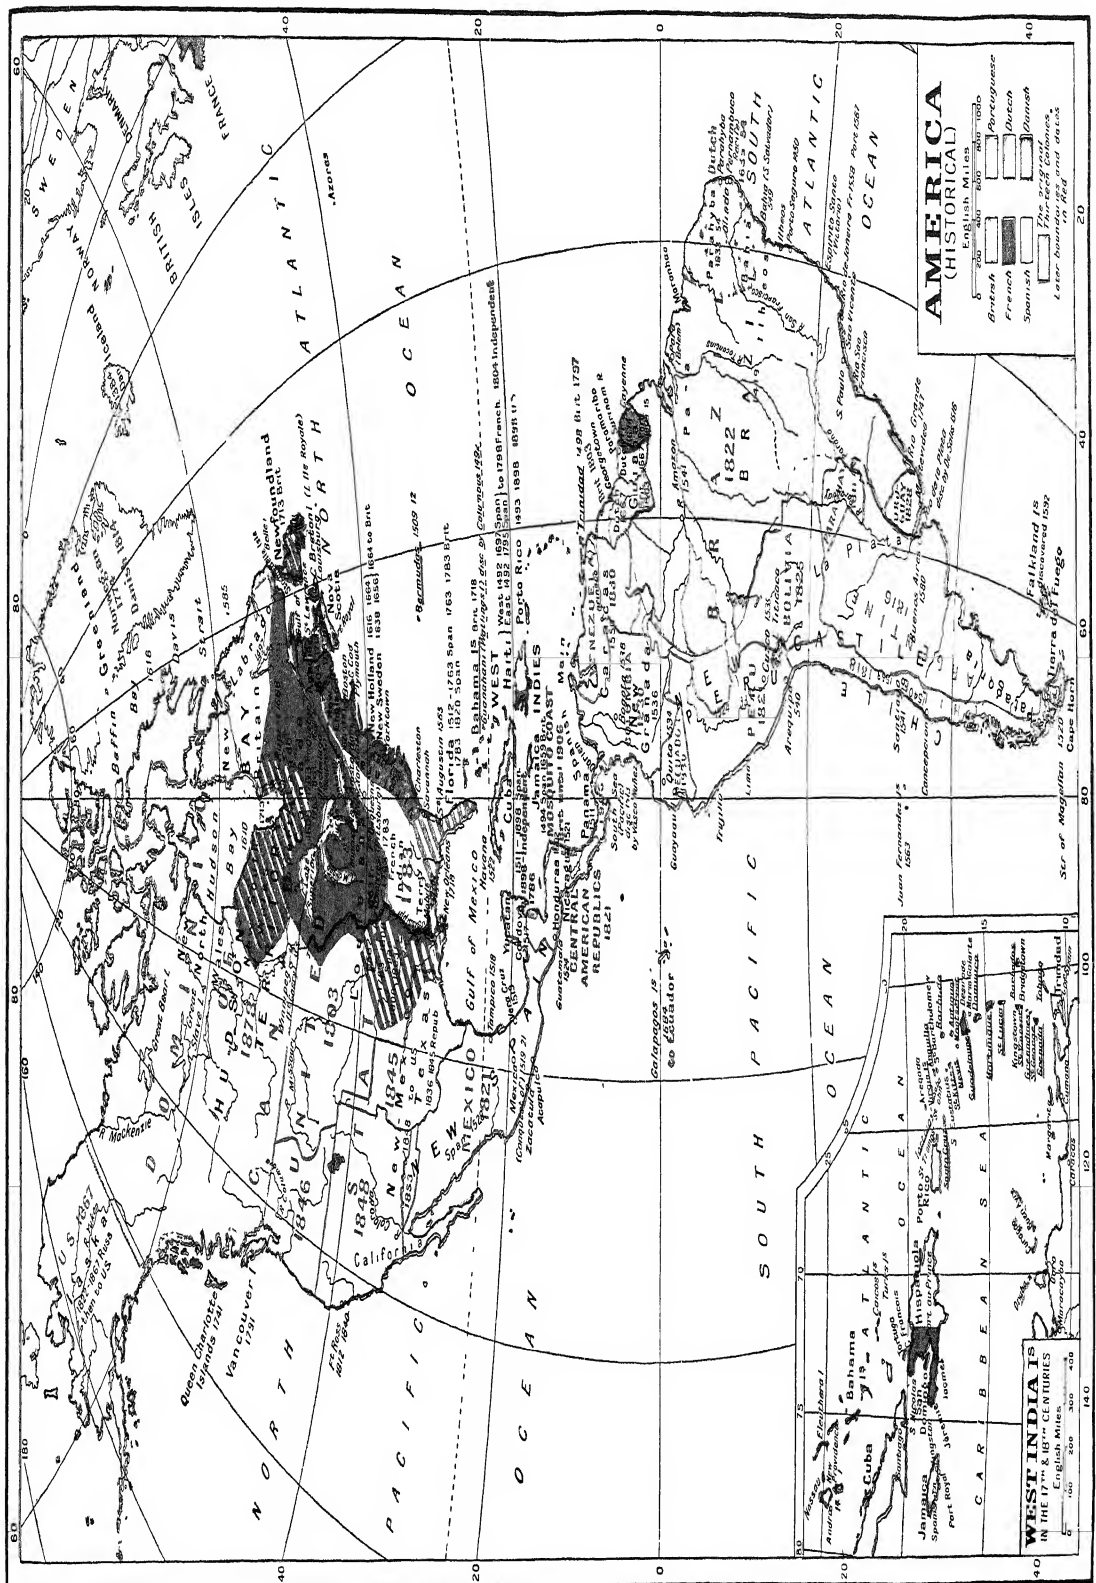

Little did these 15th and 16th century pioneers imagine what an immense difference their discoveries would ultimately make to the image of the globe. North America covers an area of 8,350,000 square miles; Central America (including the islands),

308,000; and South America, 7,047,000; making a total of 15,705,000. Thus North America alone is almost twice the size of Europe, and South America is more than $1\frac{1}{2}$ times its size.

Most of the physical features of America are sufficiently indicated by the map, from which it is obvious that many of them are on a large scale. In the Missouri-Mississippi it possesses the longest river in the world, stretching for 4,502 miles. This is closely followed by the Amazon, with its 4,000 miles. America possesses no single lake approaching the size of the Caspian, with its 170,000 square miles, but the so-called Great Lakes—Superior, Huron, Michigan, Erie, and Ontario—contribute the quite respectable total of 94,710, and thus constitute the second largest continuous stretch of fresh water in the world. Two cataracts in the Yosemite region head the list of the world's waterfalls in order of height, while Niagara, though far below many others in height and volume, is undoubtedly the most famous of all waterfalls.

Several mountain peaks in the Andes are excelled only by those of the Himalayas. Aconcagua rises to 22,976 feet, and seven other peaks in the same range exceed 20,000 feet. Then comes Mt. McKinley in Alaska, also above 20,000. The next three are Cotopaxi in the Andes and Mts. Logan and St. Elias in the Rockies, each above 19,000.

Of the climate it need only be said that America offers specimens of every variety of weather and temperature, as might be expected in a continent stretching nearly all the way between the two Poles. Special note should be taken, however, of the effect produced

In this map is rendered graphically the story of the discovery and acquisition by European powers of territory in the New World. By means of the dates in the different sections may be noted the rapid diminution of the French and Spanish empires, and the growth of the modern States.

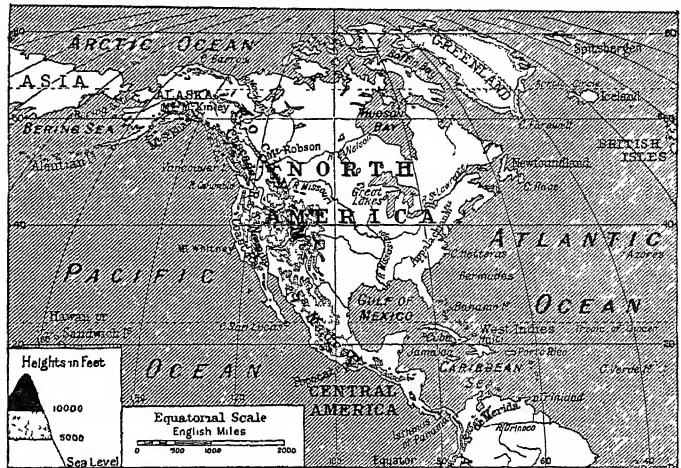

by the great mountain ranges upon winds and rainfall, and by the ocean currents upon the temperature of the coasts.
